California's Agricultural Fair

THERE will be agricultural fairs held only in an even dozen of California's 58 counties. One of these, that in Sacramento County, is the state fair.

The state fair has become a California institution. It was once an institution similar to some 30 or 40 others held in practically every state in the Union, that is, a place where the ponies were the principal attraction and the well beaten path around under the grandstand indicated anything but a semi-arid climate or condition in which the state finds itself today.

Agriculture predominates; there are some feature attractions, but we believe there is no more true-to-name agricultural fair than that of our own state. The present board of directors, with George Roeding for president and Charles Payne for secretary, is doing some effective work. In making announcement of the coming fair, the board says:

"The people of California, in common with those of all our nation, are this year facing new and

constantly changing conditions. The aftermath of the world war brings lack of stability in all activities, while social and business unrest tax the best minds of the nation in search of relief. It is a situation that calls for sound judgment and forbearance. The immediate future is involved in a maze of doubt and uncertainty.

"Notwithstanding these circumstances there can be no question of the duty of California's citizens to proceed in the orderly and efficient way with their individual affairs, that in the aggregate the business of the many may attain success. The first requirement is to continue and to increase production. With a notable scarcity of labor for the field, farm or factory, the problems of the producer are multiplied, while the scope of his activities is limited. He must therefore aim to produce maximum results with such facilities as may be available. He must critically judge his own methods and results as compared with those of his associate or competitor, and from their common efforts evolve the system or procedure that will go farthest in human service." (Cont. on Page 11.)

One Dollar Yearly

California Citrus Convention

By Ernest Braunton

THE first summer session of the California Citrus Institute was held at Santa Ana, June 24 and 25. The attendance was more than 350 and the writer talked with members from Porterville, Tulare County, on the north, to Chula Vista, San Diego County and El Centro, Imperial County, on the south.

Aside from the two days' program fairly teeming with mental feasts, a goodly supper was served in the Elks' banquet hall on the evening of the first day. On the morning following the convention those who remained in Santa Ana were given a ride through the citrus belt of Orange County. Everything moved as smoothly as a ship behind the harbor bar, and too much praise cannot be bestowed upon the Orange County farm bureau which financed and managed the proceedings from the first blare of trumpets to the last tap of the drum.

The convention opened with an address of welcome by J. G. Mitchell,

at Riverside told me there was no necessity for an experiment station and that fertilizers were not needed, for the soils were inexhaustibly rich.

"But the question of fertilizing is worrying all of us today and no one knows the solution. Scientific men are badly at sea on the question. The experiment station staff can only tell what they know today. A year from now the tale may be quite different, the investigator constantly changes his views. The most striking change has come in the form of fertilizers. Eight years ago it was largely concentrates, but we now know we must have more organic matter. Our climate rapidly burns up humus and yet we must have it, for humus is a fundamental need. We now use all the organic matter possible to obtain.

More Dairies Needed

"We need more dairies and the production and conservation of all animal manures possible. Eight years ago I saw manure dumped in waste places in many parts of the state. Five years ago in Tulare County I saw alfalfa hay burned to get rid of it. There was no sale for it. Today it has a fertilizer value of \$18 a ton for the nitrogen content. In the past we have been getting heavy supplies of dairy manure from Imperial Valley, now the farmers there wish to use it. We still are getting some from Nevada.

"It may be that we must grow native leguminous plants of a perennial nature. In several parts of the state I see a rank growing yellow flowered lupine, *Lupinus arboreus*; it should prove useful. Other native lupines should be tried and of the nearly related astragali we have many. The melilotus is good but an annual. The action of organic material in the soil is slow, often requiring five or six years to show the effect. For quick action nitrate of soda is the best source of nitrogen, but alone will not do. We must also have organic nitrogen, especially on some soils where too much alkalinity is already present. On light sandy soils nitrate of soda may be freely used.

New Oranges Needed

"Varieties of oranges is one of our most important matters; we need improved ones. The Navel, augmented by the Valencia, is fine, but neither is of the best; neither is good enough. The Navel fruit is fine but the tree is a poor one, weak in many respects and easily affected by many ills and not so good as the Valencia tree. But, on the other hand, the Valencia fruit is not good enough. It is one per cent lower in both sugar and acid than the Navel. Give us a better Navel tree and a better Valencia fruit. Plant breeders and farmers can solve the problem. Do more experimental work. Work for improvement. Every orchardist should have a corner for carefully cross-bred seedlings. You may be the man to give us a new and better orange. Keep at it. This new institute is a grand thing; the ex-

perimental needs are not supplied by our station; you all may aid in the work. I sincerely regret leaving California; should any of you visit South Carolina I shall be pleased to have you come to see me. I bid you all farewell."

Care of Orange Groves

Professor R. S. Vaile of Riverside experiment station then spoke on the general question of care of mature orange groves by telling of results obtained in pruning, fertilizing and soil handling at the Arlington experimental grove, a synopsis of which follows:

"In new root growth we find the fibrous roots at from three to 20 inches below the surface. The orange tree is a surface feeder. In the tropics all are surface rooters. In Mesopotamia the soil is mulched with palm leaves, grass and other material to keep the upper soil cool and moist. Any sys-

the manured plats still look best and give the most promise. While stable manure gives best permanent results it should be plowed in deeply. The cover crop's chief value at once is in nitrogen added but its influence lasts. We found deep plowing generally beneficial. Summer cover cropped plats were not better than manured plats. In pruning over a five year period we found moderately pruned trees yielded much better than heavily pruned trees. We found it best to plow deeply in early spring, before season's growth starts."

Pruning and Fertilizing

The next paper presented was on pruning matured orange trees, by Robert W. Hodgson, farm adviser of Los Angeles County, but who is still instructor of citriculture at the state college of agriculture. A brief synopsis of Mr. Hodgson's paper was given in the Cultivator of June 26, in reporting a pruning demonstration on lemon trees at Whittier, and the full paper will be given later.

Dr. Herbert J. Webber

His last photo in California, snapped by the Cultivator man at the Citrus Institute, Santa Ana. Dr. Webber left for South Carolina, July 1.

mayor of Santa Ana, who assured the visitors of royal entertainment among "the people of Orange County, the best people on earth." A brief response was made by Dr. J. T. Barrett, the president of the Institute, who recounted the various movements looking to the organization, the aims, purposes and hopes of the Institute. He then introduced the first speaker of the program,

Dr. Herbert J. Webber

Dr. Webber said: "As I am leaving for my new South Carolina home one week from today, I shall take the liberty of discussing the whole citrus question rather than confine myself to the specific subject assigned me. When I came here eight years ago one of the most prominent orange growers

Breaking Plowsole on C. C. Chapman Ranch

Repeated diskings forms a plowsole at four or five inches. This chisel-tooth cultivator is running seven inches to break it up. Harrowing will follow.

tem of soil management that encourages root growth is right. At Riverside orange trees 25 to 30 years old had to be rejuvenated and have been rejuvenated, though they have received sufficient fertilizer throughout their entire life. The condition was due to poor physical condition of the soil.

"During six years previous to the 1913 freeze the trees had yielded well. Following the freeze they produced but one-fourth box to the tree. The best results came from immediately available fertilizer; no other treatment yielded anything the first year. The five years following showed the value of nitrogenous fertilizer. During the second year the mulched plats showed greatest improvement, for trees improved in all ways. But permanent mulch was finally productive of mottling and plats were deeply plowed.

"The manured or fertilized plats were better in all respects, and stable manure was as good as any but for three years showed little gain. For several years the chemically fertilized plats gave as good results as those given stable manure and the cost of fertilizing was less. But in the end

The first speaker of the afternoon was H. F. Pressey, assistant manager Rancho Sespe, Sespe, Ventura County, on "Cultural Methods With Light Soils." Mr. Pressy said:

"I shall speak to you of our three main factors in orange culture—irrigation, cultivation, fertilization. The distance between pipe lines must not be excessive. On one 30 acres we have them 150 feet apart on a grade of one per cent. On silt soil we run the water 48 hours. We have found this water to go down 12 feet, and in our walnut orchard the roots are at that depth. We give five such irrigations each season. On gravelly soil we run the water but 24 hours and give seven irrigations. We make our first spring run in April but we use shovel and auger at all times to determine soil conditions. We usually use eight acre-inches at each irrigation.

"We plow early, in January and February, occasionally as late as March. A keen outlook should be kept that orchards are not needing water at that critical period when they are making their heaviest growth. We irrigate as close to the tree as we can, first run-

(Continued on Page 14.)

Agricultural News Notes of the Pacific Coast

Northern California

San Leandro held a cherry festival Saturday, June 26.

Shortage of baling wire in some haying sections is delaying work.

Sutter County reports sales of soda dipped raisins at 20 cents per pound.

The Chico mill of the Sperry Company has installed a paddy machine.

Gridley, Butte County, now has a paved street connecting with the state highway.

Yuba County has an ordinance limiting loads of trucks on her highways to 17,000 pounds.

It has been decided to consolidate the Sonoma and Marin County cow testing associations.

Light showers fell in Butte County the middle of June. No damage reported by grain and hay farmers.

Manager Dunlap of the California Prune and Apricot Growers Association says that \$90 a ton is being offered for apricots in many sections.

Cattlemen who have stock running on ranges in the Plumas national forest say that the grazing has been greatly improved by recent showers.

A meeting of the alfalfa growers of Butte County was held at the state land colony at Durham on June 16. Marketing problems were discussed.

The first carload of deciduous fruit from the Delta district was sent from Walnut Grove on June 16. It was a mixed car of plums, peaches and pears.

The state immigration and housing commission interprets the law as to labor camps to apply to any building or tent in which five or more men are housed.

The first sale of hogs held by the Glenn County Hog Growers Association was a big success. Five cars were sold at Willows and one car at Maxwell.

A delegation of poultrymen from Petaluma has petitioned the Sonoma County supervisors to aid in establishing a poultry pathologist and laboratory at Petaluma.

Superintendent Rodgers of the Plumas national forest says that snow is heaped high in the Sierra Nevadas and that Sacramento Valley will have no water famine this year.

The Yuba County supervisors have passed an ordinance requiring all motor trucks operating in the county to carry a license of \$5 per ton per year, outside owners to pay \$25 per year.

The Central California Berry Growers Association is asking the state department of agriculture for a meeting to determine as to weights, measures and standardization of fruit and containers.

The state highway commission has assured the Sutter County chamber of commerce that the portion of the Lake Tahoe-Ukiah state highway passing through Sutter County will be built immediately.

The board of trustees of Antioch has filed an injunction suit to restrain rice growers from using waters of the Sacramento River. The reason for the suit is that the lower delta people claim when the waters are all lifted from the upper river the tide brings in salt water until the productivity of the lower delta lands is destroyed.

Central California

Tulare County has ruled that all dogs shall be muzzled.

Turlock reports a freak June shower which netted only two-tenths of an inch. •

A new buttermilk condensing plant is being built at Hanford, Kings County.

The Merced County farm bureau has instituted a cooperative marketing association.

The Terra Bella district of Tulare County reports a big crop of apricots, almonds and peaches.

The Stevinson colony at Merced has petitioned to be included in the Merced irrigation district.

County Agent Jungerman of Stanislaus announces a farm bureau hog auction sale on July 6 at Modesto.

The creameries at Tulare have been paying 63 and 63½ cents for butter fat and 66 cents for sweet cream.

Tulare Lake grain growing section is now in full harvest swing. The crop is running larger than anticipated.

The new cannery built at Reedley, Fresno County, is now operating. It has a capacity of 5,000 cases per day.

Fig sections report a shortage of Smyrna capri figs as late frosts in the fall destroyed many of the fig wasps.

Tulare County Grange recently held an all day meeting. The next meeting will be held Saturday of this week.

The San Joaquin Table Grape Growers Association held a meeting at Lodi on June 23 to discuss the marketing situation.

Professor R. D. Easton of the University of California has just finished a week's demonstration in poultry culling at Visalia.

Owing to the June rainfall vineyardists of the San Joaquin Valley were forced to give an additional sulphuring to prevent development of mildew.

Manager Niswander of the Fig Growers Association reports that the campaign to secure members is succeeding better even than was hoped.

Watsonville, Santa Cruz County, shipped its last carload of apples on June 14, bringing the total for the season up to 3,493 cars as against 2,473 in 1919.

The Fresno County chamber of commerce reports requests from an eastern firm to locate 75 carloads of wine grapes which may be purchased and shipped east.

The Tulare County Canning Peach Growers Association recently made a sale of 1,850 tons of freestones and clings at \$100 per ton for the clings and \$60 for frees.

Top prices at California farm bureau marketing association fat hog sales: Visalia, June 8, \$15.50; Tulare, \$15.75; Hanford, June 10, \$15.40; Corcoran, June 11, \$16.20; McFarland, June 12, \$15.65.

Fig growers of the San Joaquin Valley are signing up with the California Peach Association. Fresno has signed up 1,362 acres, Fowler 700, Selma 1,275, Kingsburg 3,000, Kings County 1,900, Tulare County 400.

Officials of the California Farmers Union, headquarters at Modesto, will attend the Democratic convention at Sacramento and urge a plank in the platform pledging larger support to cooperative farm operations.

Southern California

Yucaipa celebrated June 12-20 as Cherry Week.

Anaheim walnut growers report prospects for light walnut crop.

San Bernardino canneries are now handling apricots from the Banning district.

It is reported that the Apricot Growers Association will set prices about July 14.

The tomato season has finished at Brawley. Prices are reported not so good as last year.

The boys' and girls' pig club at Harper, Orange County, will close its contest on July 10.

Orange County apricot growers report practically no offers from independent buyers or from canneries.

An effort is being made to organize the onion growers of the Coachella Valley into a marketing association.

The chamber of commerce of Perris, Riverside County, is discussing the need of a cooperative gin at that center.

Cotton growing members of the Imperial County farm bureau are organizing a cooperative marketing association.

According to an Ontario paper, S. J. Ulrey has received check for \$4,752 in payment for 613 sacks of White Rose potatoes.

Sixty-five thousand sacks of beans have been cleaned by the warehouse at Smeltzer, Orange County. It is now closed for the season.

Apricot drying camps are operating in Orange County and growers say that they are not experiencing any difficulty in getting help.

Members of the Claremont Pomological Club attended sessions of the citrus institute at Santa Ana on Thursday and Friday of last week.

Orange County growers report that they are shipping potatoes to Northern and Eastern markets and netting \$7.00 to \$7.50 per hundred pounds.

The San Bernardino County farm bureau has taken up seriously the question of enforcing laws against heavy trucking over expensive roads.

The farm bureau of Imperial County has elected R. H. Clark president. The bureau also has a new adviser in E. L. Garthwaite who took up his work July 1.

The Harper farm center of the Orange County farm bureau has appointed a committee to arrange the county fair exhibits for the big fall event at Huntington Beach.

No regular farm bureau center meetings will be held in Orange County during July and August. Requests for special field demonstrations will however receive prompt attention.

The cannery of the California Growers Association at Riverside has opened on apricots. An interesting feature of last year's market was the shipment of 5,000 cans of apricots from this cannery to Iceland.

As an inducement for packers to stay the season out the packing houses on the San Joaquin ranch in Orange County are offering bonuses. The orange packing house will give one-half cent on the box, the lemon house one cent, payable at the end of the season.

The Coast and General

All the northwest states report a very cold and late spring, delaying growth in all farm crops.

Nevada's wool output this year is estimated at 8,000,000 pounds, which is one-fourth less than last year.

It is proposed to create a drainage district of approximately 22,000 acres southwest of Puyallup, Washington.

A model dairy is being established in connection with the Litchfield cotton plantation about 15 miles west of Phoenix.

One tractor dealer claims to have sold more than 200 tractors in the Salt River Valley of Arizona during the past year.

It is estimated that between 700 and 800 carloads of onions will be produced in the neighborhood of Walla Walla, Washington, this year.

The chick pea crop of Sonora, Mexico, is estimated to be worth \$6,000,000 this year. Most of this will be moved through the port of Nogales.

The last gap of the 25 mile concrete road between Bisbee and Douglas is now being completed. This will make the largest stretch of concrete road in Arizona.

The cantaloupe season in the Salt River Valley of Arizona will open up about June 25. A representative of the United States bureau of markets will be established in the chamber of commerce, Phoenix, to aid in marketing the crop.

W. S. Norveil, state water commissioner for Arizona, has just granted a permit to the Harrisburg Water Users Association for the use of water from the Centennial wash, Yuma County, for the irrigation of nearly 7,000 acres of land.

H. K. Holman Jr. of the United States department of agriculture, representing the warehouse investigation division, is spending some time in the Salt River Valley of Arizona with a view to acquainting the owners of warehouses with the practicability of bonding under the provisions of the warehouse act.

A revival of interest in manufacturing rubber and other products from ocotilla seems probable. Work was begun on a plant for the extraction of the gum from this variety of cacti near Salome, Arizona, just before the war, and was suspended owing to war conditions. It is now expected that work will go forward within a short time.

The United States land office has recently announced the opening of several small areas of land in Arizona. Filings upon it may be made July 14. A part of six townships in Coconino County, north of the Colorado River, are among those to be opened. A small area in Yavapai and another small area in Pima County are also opened up. As usual, ex-service men are given prior right on these filings.

A plan is being contemplated for the building of a road from Clifton, Arizona, to Springerville. This will pass through the White Mountain region, a section noted for its scenic wonders. This is something of a sportsman's paradise, as what is said to be the finest trout fishing in America is in the Black River. This road, if built, will be a cooperative arrangement between the county of Greenlee and the United States forestry service.

GEORGE SHIMA, the potato grower, likewise speculator, who, it was asserted a few months ago, speculated to the extent of securing a corner on California potatoes, has written an "Appeal to Justice," of which he sent us a copy. He says:

"As we listen to the passing storm of passion, of denunciation, of abuse and slander, we ask ourselves if we were mistaken in our belief in your honor, in our faith that you would not strip us of the protection of the common law of equity and deny us the equal protection of your laws.

"It is a painful question. We are few in numbers, defenseless except by the truth. You are a myriad in numbers and strong. You are taught at your altars to love your neighbors and that it is a scarlet sin to bear false witness against them. Surely you would not heed those who make business of spreading falsehoods about us, and urge you to persecute your peaceable, industrious and law abiding neighbors such as the Japanese.

"Our good opinion of you and your country may seem of little value to you. But it has been of great value to us. It has guided us on our hard march onward for the past 60 years. It was a march to which your land summoned us, with promise of peace and friendship at its end. If you listen to enemies of the world's good order, and deny us that promise which we have followed as a great light, how can you summon others to trust you?"

As to the "storm of passion" we feel that Mr. Shima has been misconstruing good American earnestness in a campaign of education for the Japanese and for the Eastern people who do not understand conditions in Cali-

fornia. Governor Stephens in a letter to Secretary of State Colby says:

"It is with great pride that I am able to state that the people of California have borne this situation and seen its developing menace with a patience and self restraint beyond all praise. California is proud to proclaim to the nation that despite this social situation her people have been guilty of no excesses and no indignities upon the Japanese within our borders. No outrage, no violence, no insult and no ignominy have been offered to the Japanese people within California."

Americans are doing simply what Japanese would do in case the perpetuity of their own race in their own land were at stake.

For instance, we understand Mr. Shima owns and occupies one of the finest residences in the city of Oakland. We also understand he is a most genial and cultured gentleman. Should the writer of these words appear at the door of that home with proper introduction we doubt not the doors would be opened and he would be bidden to enter; possibly he would be given the freedom of the home. But, presuming on the cordial welcome, if he should proceed to invite his friends and others to continue to come until the comfort and even the safety of the home should be jeopardized, how long would it be before Mr. Shima would withdraw his cordial welcome?

It is not a question of likes or dislikes; it is not a question of race su-

periority or inferiority; it is simply a question of whether California, a portion of the American nation, is to be used as a home for Japanese or Americans.

Americans gave most cordial welcome to the Japanese. We soon learned that the cordiality was being misconstrued by the Japanese and when they began sending for their picture brides and rearing Japanese children in whose names "as American citizens" title to lands were recorded, the time came for instant and vigorous action.

Governor Stephens has made a very strong statement of California's position, her attitude toward the Japanese and her determination to save California for the children of Californians and other Americans. We cannot quote in full. Here are extracts:

"It is also proper to state that I believe I speak the feelings of our people when I express to you a full recognition of the many admirable qualities of the Japanese people. We assume no arrogant superiority of race or culture over them. Their art, their literature, their philosophy, and, in recent years, their scientific attainments, have gained for them a respect from the white peoples in which we, who know them so well, fully share. We have learned to admire the brilliance of their art and the genius their people display. We respect that deep philosophy which flows so placidly out of that wonderful past of theirs and which has come down through ages that antedate our Christian era. We

join with the entire civilized world in our admiration of the tremendous strides which the Japanese nation itself has made in the last two generations, unparalleled as its career is in the history of nations. We respect the right of the Japanese to their true development and to the attainment of their destiny. All these matters I am at pains to emphasize so as to convince you, and, through you, the people of our United States, that this problem of ours is not an insignificant or temporary one. It is not factious. It has no origin in narrow race prejudice or rancor or hostility. It is, however, a solemn problem affecting our entire occidental civilization. It has nothing to do with any pretensions of race superiority but has vitality to do with race dissimilarity and unassimilability.

"But with all this, the people of California are determined to repress a developing Japanese community within our midst. They are determined to exhaust every power in their keeping to maintain this state for its own people. This determination is based fundamentally upon the ethnological impossibility of assimilating the Japanese people and the consequent alternative of increasing a population whose very race isolation must be fraught with the gravest consequences.

"California stands as an outpost on the western edge of occidental civilization. Her people are the sons or the followers of the Argonauts who wended their way westward over the plains of the Middle West, the Rocky Mountains and the desert; and here they set up their homes and planted their flags; and here, without them-

(Continued on Page 8.)

Manure or Cover Crops in the Orchard---Which?

CAN we maintain the soil of an orchard year after year during the life of the oldest orchard trees without the use of stable manure? The most contradictory answers come back, for the "Yes" and "No" are so emphatic, each trying to drown the other, that it is hard for the novice, seeking the truth

By C. B. Messenger

in the matter, to reach a definite conclusion. I believe the greater number of the orchardists who are keeping their orchards in most perfect producing condition are using manures. Note, I say, "manures" and do not include commercial fertilizers. The users of stable manures assert—and it appears to be the truth—that the application of highest priced fertilizers whose analysis shows the greatest content of plant food accomplishes little or nothing until physical condition of the soil is secured which favors assimilation by the plants of the chemicals which have been applied. This condition is not secured excepting through the presence in the soil of vegetable material, call it humus or what you will, which accelerates this chemical action.

Note I said "the greater number," but the other day I saw in an orchard trees, perhaps 20 years old or older, on which no stable manures whatever are applied. The orchard does receive a liberal dressing (25 pounds per tree) of commercial fertilizer in the spring of each year. This is usually one of the best "complete" commercial fertilizers, but in addition there is occasionally an application of nitrate of soda or sulphate of ammonia. Then, perhaps about the first of June, a seeding of Whip-poor-will cow peas is planted and the ground furrowed ready for the summer irrigation. It is irrigated thoroughly in these same furrows through the summer. The nature of the growth se-

cured through the orchard is shown in the first illustration on this page. This crop is worked into the soil, and in October, or by the first of November, a seeding of small horse beans is planted for the winter crop. This practice has been followed for 14 years without the application of an ounce of stable manure. This example is the orchard of Ed. L. Dreher and is in the eastern edge of Los Angeles County near Claremont.

Mr. Dreher says he has used Melilotus indica but that in doing this the chick weed got so thick that it was impossible for the clover to grow. "I then tried horse beans and have not been sorry. Cow peas for summer and horse beans for winter are my favorites." Mr. Dreher has also tried Melilotus alba for a summer crop, but in bulk it is not to be compared to the cow peas. Vetches have never succeeded well as winter producers.

In some sections the methods followed by Mr. Dreher may be con-

(Continued on Page 8.)

Remarkable Growth of Cover Crop
Whip-poor-will cow peas showing 14 foot growth. Foreground also shows immense covering of soil made by this summer green manure crop.

Furrowing After Seeding Summer Cover Crop.

The ground is given thorough cultivation and irrigation. Seed is drilled in, then the four furrowers are placed behind and these furrows made and left during the entire season. As the crop begins to grow the flow of water is clogged somewhat, but care is taken that the furrows are deep enough to carry the water without any danger of breaking out. This is on the place of E. L. Dreher, near Claremont, Los Angeles County. Mr. Dreher driving tractor.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

ON SAN FRANCISCO

The eyes of the world are on San Francisco this week. Democracy is being made perfectly safe. It's an interesting place to be. "We" are there. The hotel lobbies are full of us. The streets are full. Everybody—excepting the wets—are, or is, full of enthusiasm. We are jostling elbows with big ones. Just walked down (squeeze through) the Palace lobby and couldn't help coming against Daniels with Geo. Creel (we brushed Creel's dust off our coat at once), Burleson, Irvin Cobb, Meredith, Senator Reed, Bryan and others, great and near great. They just mix and say "Hello, Bill!" just the same as folks do. This is Sunday before the convention. They may not be mixing so much by the time these words are read. Of the bunch we like Meredith best.

MEREDITH

Secretary of Agriculture Meredith is some advertiser and we are not on his publicity staff. So this is not for political consumption.

The secretary is a farmer. He understands the problems. He is fighting for maintaining the efficiency of the department for the farmer. He scored, in an address at a luncheon tendered him by the Commercial Club,

Chamber of Commerce and California Tractor Association, the recent congress for reducing the funds needed in department work by nearly ten millions, and at same time continuing the congressional seed distribution fiasco.

There were enough opposing Republicans to have carried the measure through. There were opposing Democrats who could have carried it. The blame is equal on both parties.

In touching upon some of the reasons why the department should have fullest support by congress, by all the people, the secretary said:

"The department has in its employ some of the foremost scientists in the world who are giving their best, at meager salaries, to the government. The fight against the cotton boll weevil, the pink boll worm, the cattle tick, hog cholera, the foot and mouth diseases of cattle, which has cost the country millions of dollars, was made by the men of the department of agriculture.

"The department includes 17 bureaus—horticulture, quarantine, good roads, weather, pure food and drugs, meat inspection, county agents, plant diseases, insect pests, introduction of new plants, market and crop reporting, eradication of livestock diseases, protection of the forests and other similar activities.

"I want to point out some of the places that the department comes in contact with you. In the first place, realize this, that the industry the department of agriculture is designed especially to serve has an invested capital of over \$80,000,000,000. You can take all the railroads in America, all the manufacturing institutions—iron, steel and all the rest, some 75 other industries—add them all together and you will have just met the capital invested in this business of agriculture. The agricultural and livestock product last year was \$25,000,000,000, equal in one year to our national debt at the present time, one-half the wealth of France."

DOCTOR OF TREES

Tulare County claims credit because of being the first county of the United States to establish and maintain a plant pathologist with fully equipped laboratory. P. A. Bonquet is the pathologist in charge and is at the service of the orchardists of the county. In order to facilitate his work and reach a larger number of fruit growers Mr. Bonquet called a pathological congress at Porterville last week to "Stop plant diseases and save millions."

Some of Mr. Bonquet's prescriptions seem rather revolutionary, but on this we may all agree: If right soil conditions are maintained and nature's laws are followed in pruning and tree pests are subdued, there will be little occasion for calling the doctor.

The big one question is: "Is it well with your soil?" Right soil conditions permit constant nitrification—prosperity.

The learning of a rule like that is much simpler than was the learning of the six per cent interest rule, or even the multiplication table in our younger days.

GRAPES BURNED

The great central valley had just one day of scorching hot weather a few days since, but enough heat was concentrated in the one day to make up for many others a bit shy on calories.

The concentration was not acceptable to some fruits, especially plums and grapes. Some plums now have a nice big blister on one side. Others don't.

The raisin industry is suffering the greatest loss, however, in burned grapes. Muscats especially are injured, in some cases 20 per cent, more generally showing around ten per cent or less. The loss will not only be direct, but in addition the percentage of "clusters" will be reduced. The larger and finer bunches often have some of the biggest and finest grapes on one side cooked. These cooked berries now souring on the vine give an odor perceptible as one drives along the roadway, like unto that of the pomace pile at the winery.

Apricots, nearly ripe, have also been injured slightly. Some growers are salvaging apricots by harvesting injured fruit, cutting and drying. Those not harvested are soon past salvaging.

Both tree and vine in strong growing condition and with abundance of big leaves have had the advantage. Another argument for that "optimum condition."

Messrs. E. E. Kaufman of the bureau of markets and Fred Howard of the Associated are gathering a fund of information as to extent of loss.

A NOTHER INSECTARY

After Harry S. Smith's address before the Tulare County fruit growers at the pathological congress the question arose: "When do we get a branch of the insectary which will investigate our gray scale situation?"

Mr. Smith had outlined the work of the state insectary in biological control of insects. The state has central office and laboratories at Sacramento with branch at Alhambra and another in cooperation with the Limoneira orchards in Ventura County. He had given particular attention, with a large number of lantern slides, to the citrus mealy bug and its deadly enemy—and friend to man—the little "crypts," whose appetite requires several well fattened young mealy bugs daily. The story as told by Mr. Smith was intensely interesting, for in addition to the nature story interest, the profitableness in spending thousands and receiving millions is always of interest.

The cryptolemus has not yet shown the remarkable accomplishment of the vedalia on white scale something like a third of a century ago. He is more deliberate, but give him time.

Meantime Tulare citrus growers want somebody or some bug to chew up the gray scale. They want Harry Smith to take the contract. He's willing. He suggests, however, that the state legislature should take the first step.

FIGS VS. CHEMICALS

A subscriber of the Cultivator notes that the supply of figs seems to be greater than the demand this year, rather, there was crowding of the market and a severe lowering of the price. He is a fig consumer, not a producer, and maintains that the cause of this is that in curing of figs chemicals are used. Especially does he object to the use of sulphur, referring to a statement of one large grower that he sulphured his figs twice. Another grower "dipped" his figs in boiling water and allowed them to soak up their weight in water. This process doubled the farmer's crop.

This last charge will be a terrible shock to some fig producers, especial-

ly this year when rainfall has lessened our supply of water.

But, seriously, there is a desire on the part of the producer to process within the boundaries of California, the finest fig on earth. Anyone who has suggestions that are constructive will find the majority of our fig growers lending attentive ears. The wholesomeness of California figs when properly sulphured, dried and dipped in boiling brine for an instant is not gainsaid. The only suggestion given by our subscriber is that figs should be split in the middle and dried without any boiling water treatment after the drying.

FARMERS DEMAND PLANKS

Farmers are in San Francisco this week presenting their claims before a national convention. Other farmers appeared in Chicago and Senator Capper said:

"For the first time in the history of national political conventions agriculture has appeared before the builders of the platform with a program and the demand that recognition be given to the fundamental industry of the nation. It was a sane, clear cut, business like statement that the farmers presented to the committee on resolutions, and it was very apparent that the members were impressed. John A. McSparran of Lancaster, Pennsylvania, headed the committee representing 37 national organizations of farmers. The planks he presented may be taken, I think, as a clear statement of what the farmers of America will insist upon. The important thing to remember is that the whole agricultural problem is of greater importance to the city man than it is to the farmer. It calls for free, full and unquestioned right for competitive marketing of products and purchase of supplies; for effective national control over the packers and all other interstate combinations of capital engaged in the manufacturing and transportation of food."

Here are some of the planks which farmers urge the party to endorse:

We recognize agriculture as the fundamental industry, and we pledge ourselves to give it practical and adequate representation in the cabinet and in the appointment of governmental officials, and of commissions on a bi-partisan basis.

We pledge to all farmers the full, free and unquestioned right of cooperative marketing of their farm products and purchase of their supplies and protection against discrimination.

We pledge effective national control over the packers and all other great interstate combinations of capital engaged for profit in the manufacturing, transportation and distribution of food and other farm products, and farm supplies.

We pledge legislation that will effectively check and reduce the growth and evils of farm tenancy. We pledge the perpetuation and strengthening of the federal farm loan system, the improvement of facilities for loans on farm commodities, and the inauguration of a system for cooperative personal credit that will enable farmers to secure short time credit on more favorable terms.

We pledge comprehensive studies of farm production costs, at home and abroad, and the uncensored publication of facts found in such studies.

We pledge ourselves to accord agriculture the same consideration in tariff legislation as is accorded to other interests.

Copyright 1920, by The Goodyear Tire & Rubber Co.

"Even slight jars bruise peaches—pneumatics protect them. My trucks on Goodyear Cord Tires help all my farming, which is largely motorized. These trucks go through the sandy loam of the fields to feed the machines and haul from them—solid-tired trucks cannot do this."
—W. W. Lowe, Farmer, Fruit Grower and Stock Raiser, Byron, Georgia

BETWEEN the lines of statements like this, one reads the narrative of a significant advance in farming methods effected with power machinery and trucks on Goodyear Cord Tires.

The labor shortage is being met on many farms by these pneumatic-tired trucks working with motorized pumping, shelling, grinding, cutting and threshing machines.

Since it usually is not practical to follow the field activities by moving such outfits along, their operation, to be fully efficient, must depend on quick cartage over soft ground.

The solid tire is not fitted for this hauling, because it stalls in loose soil, whereas the big Goodyear Cord Tires supply the traction necessary in off-the-road hauling.

Their immense strength proceeds from that manufacturing care which, in protecting our good name, has developed the sinewy toughness of their Goodyear Cord construction.

Farmers' reports, showing how pneumatics on trucks help increase farm incomes, can be obtained by writing to The Goodyear Tire & Rubber Company, Akron, Ohio.

Almond Huller

Manufactured and Patented by
L. K. VAUGHAN, 172 Elm St., Woodland, Cal.

Some Smiles For The Farmer

Have you seen the Almond Huller that don't wear out the fingers and you don't have to stand at the stacker and see the meats going into the hulls as loss? With this machine you can hull or crack all the nuts and no waste at all and have time to go to all the fairs and no worry. Write for any information. 1-1.3 tons in 10 hours guaranteed. Price \$385.

Build Up Your Soil With Whip-Poor-Will Cow Peas

WHAT THEY WILL DO:

- | | |
|---|--|
| They make the best summer cover-crop. | Afford the best kind of pasture for cattle and hogs. |
| Maintain a moist surface mulch. | As a hay have a food value of 43% more than Alfalfa. |
| Will prevent June drop. | Will improve your silage. |
| Require less irrigation than other crops. | There is no better Bee Pasture. |
| Need no irrigation where soil moisture has been conserved. | Thirty pounds of seed is sufficient to plant one acre. |
| Build up poor soils with more nitrogen bacteria and humus than any other covercrop. | Our seed germinated 96%. |

This Folder Tells You How To Make Your Idle Land Earn Money

This is the day and age when you should make every foot of land produce profits for you. If you have any size tract ranging from 80 to 5,000 acres in the Western States that need development you should send for this book at once. It tells you the way to develop your property through the use of Hydro-Electric plants, gravity irrigation systems, pumping plants, grading, and buildings; in fact, it points out the various essentials that are necessary to make your ranch a producing property. Now is the time to act, so that you can get a crop from your land next year. It is a certainty that crops will bring good prices next year, so take advantage of this condition and get your land under cultivation now. Write today, stating location of land and number of acres.

AN APPEAL TO JUSTICE

(Continued from Page 5.)

selves recognizing it at the time, they took the farthest westward step that the white man can take. From our shores roll the waters of the Pacific. From our coast the mind's eye takes its gaze and sees on the other shores of that great ocean the teeming millions of the Orient, with its institutions running their roots into the most venerable antiquity, its own inherited philosophy and standards of life, its own peculiar races and colors.

"The Pacific, we feel, is shortly to become one of the most important highways of commerce on this earth. Amity and concord and that interchange of material goods, as well as ideas which such facilities offer will inevitably take place to the benefit of both continents. But that our white stock will readily intermix with the yellow strains of Asia, and that out of this inter-relationship shall be born a new composite human being is manifestly impossible. Singularly enough, while historical facts are not always susceptible of scientific demonstration, it is true, if our study serves us, that the blood fusion of the Occident and the Orient has nowhere ever successfully taken place. Whether the cause be but a social sense of repugnance, or whether it be insuperable scientific hindrances, is utterly beside the question. We stand today at this point of western contact with the Orient, just as the Greeks who settled in Asia Minor 3,000 years ago stood at its eastern point. And while Mesopotamia and the country to the east thereof were the highways of intercourse between the Orient of that time and the Occident of that era, and while, historically, there was much of contact and conflict between the types representing the two standards of civilization, history does not show any material fusion of either blood or idea between these peoples."

More Than 100,000 Japanese in California

From a statement issued by McClatchy of the Sacramento Bee, we quote:

"From L. E. Ross, registrar of vital statistics of the California state board of health have been obtained his latest birth and population statistics for California, covering the year ending December 31, 1919, which are presented in the table below. The figures for population (total, and total except Japanese) are estimated from data not yet available to the public. The total Japanese population is an estimate based on data secured by the state board of control and advance census data, none of which has yet been given to the public.

	Population	Birth rate
		Per M.
Total	3,234,209	56,521
Total, except Japanese	3,138,209	52,063
White	96,000	4,458
Japanese		46.44
Other than Whites and Japanese (Chinese, Negroes and Indians)		747

"The figures on analysis point to a number of interesting and significant conclusions.

"In the first place, while the Japanese Association of America, Sidney L. Gulich, and his Pacific colleague, Col. John P. Irish, have insisted that the total Japanese population of California does not exceed 70,000, and have ridiculed me for declaring—as I have for a year past—that there was good reason to believe the number was about 100,000, the registrar of the state board of health, because of reports from the census office and investigation made by the state board of control under instruction of the California legislature, now estimates that population at 96,000. It must be remembered in this connection that this estimate probably is too low because of the evident attempt of the Japanese to avoid full tally in the census enumeration, the reason for which will appear later in this article. That attempt was so apparent that recount of Japanese was ordered in several districts of California. In the only one in which the result has been made public—San Diego County—there were found 1,200 Japanese instead of the 800 turned in by them on the first enumeration—an increase of 50 per cent. That same percentage, if it obtains throughout the state, would raise

the Japanese estimate of population, 70,000 to 105,000. It is evident, too, that in some places the recount has been ineffective, as it is comparatively easy, under the existing system, even for American citizens to avoid enumeration or miss it unintentionally. In the case of aliens, particularly, there should be a system of registration, calling for possession of a card on the part of each alien.

"Next note that the Japanese, with one thirty-third of the population, produce one-twelfth as many births as all other races combined, including the whites; that is to say, the Japanese birth rate per thousand is almost three times as great as that of all the other races in California combined, the respective birth rates being 16.59 and 46.44.

"The birth rate accorded the Japanese by the board of health, in the past and quoted by myself, is much higher—62 or 64 per thousand—four times that of the whites, due to the fact that the Japanese estimate of population, 70,000, was accepted by the board as approximately correct.

"The birth rate now established—three times as great as the whites, when considered in conjunction with the fact that the present proportion of females to males among the Japanese is only one to four, which proportion is being steadily increased, while the proportion among whites is one to one, makes a problem sufficiently grave.

"How long will it take a prolific, hardy race like the Japanese, with only one-thirtieth of the number of the white race in California, but with a birth rate three times as great, and with the avowed determination to establish themselves through racial increase and control of land, to surpass the white race in numbers? And if they increase the proportion of females to one to two, instead of one to four, how much less time will it take? In Hawaii, already more than 50 per cent. of all children born, and of all new school registrations, are Japanese. How long will it take to produce that result in California, then in other states, and finally in the Union, if the fecundity of the Japanese is aided by continued immigration?

"Note that the total number of white births in California in 1919 was 51,316. Of births other than white there were 5,205, and of that number 4,458 were Japanese, and the balance, 747, divided among all the other races represented, Chinese, Negroes, Indians, etc. That is to say, among the races other than white in California the Japanese are furnishing six times as many births as all the others combined! In 1908, after adoption of the gentlemen's agreement, the Japanese births numbered 455. Their annual births have multiplied since then ten fold, and still steadily increase. Does that furnish food for reflection to Americans who realize the danger from an overwhelming flood of a non-assimilable race, superior in economic competition?"

MANURE OR COVER CROPS IN THE ORCHARD—WHICH?

(Continued from Page 5.)

sidered the only ones which will save the orchard to profitable productivity. Many an orchard in California is entirely beyond the reach of stable manure. Bean straw and even baled alfalfa hay have been purchased by some orchardists to make up for the lack of wealth producing vegetable matter in the soil, but present day prices of hay or even straw put them entirely beyond possibility as soil restorers. The methods described above are least costly and are certainly effective if rich, deep green, glossy foliage and trees filled with young fruit are any indication of a profit producing orchard.

On the subject of green manure crops in California the department of agriculture issued some years ago a bulletin touching methods followed at that time. In the introduction Mr. McKee, the author says:

The use of green manure crops for the maintenance of soil fertility is one of the oldest of agricultural practices. In California such crops have been used in a limited way for a long time, yet it is only within recent years that their practical value has become fully recognized. The growing of these crops has attained its greatest development in the citrus orchards of the southern part of the

Puzzle: Find the Man in the Picture

Not quite a six footer, but a full size man is standing in the horse beans which show a growth of five feet. This is a winter cover crop planted October 29, 1919. This picture taken March 11, 1920.

state where they have been longest used.

As far back as the early nineties some of the more progressive orchardists were beginning to realize the necessity of some such practice as green manuring and to this end utilized the natural growth of bur clover and other weeds, such as alfalfa, brome grasses, etc. The Canada field pea was the first of the legumes to be used extensively as a green manure crop and by 1900 it was being quite generally grown in the citrus orchards of the southern part of the state. Common vetch and bur clover were also being utilized at this time.

In many parts of California green manure crops have not been used to any extent, but not entirely without reason. That their use can be made much more general than at present is quite certain, and as their value is more fully appreciated and their adaptation to the various sections demonstrated their use will be proportionately increased.

In closing he make the following summary:

California soils, though often very fertile, are generally deficient in humus.

Within recent years green manure crops in California have been given special attention.

The only places where green manures are being used extensively are the citrus and walnut orchards of the southern part of the state.

Deciduous orchard sections are using practically no green manure crop.

By the use of green manures a generally improved condition of orchards has been secured, as shown by a more healthy appearance of the trees and more and better fruit.

The early seeding of green manure crops is desirable for obtaining the best results.

Green manures should be turned under before the trees start new growth in the spring.

Heavier seeding than is ordinarily practiced is advised.

Common vetch and field peas are the most generally used green manure crops, the vetch being the most popular.

Peas or common vetch sown in the fall without irrigation will not, except in the most favorable years, make sufficient growth to be turned under early as a green manure, but when thus sown will make a good growth later in the spring.

Field peas, common vetch and bur clover are adapted to quite varied conditions, and are being grown in a limited way throughout the state.

In any part of the state having a mild winter a green manure crop of peas or common vetch will succeed if sown early in the fall with irrigation.

Bur clover seems to be of most value for deciduous orchard conditions, while the woolly podded vetch promises to be of value for the same conditions.

Fenugreek and bur clover are used to a limited extent, fenugreek being especially adapted to the region near the coast.

Hairy vetch is not well adapted for use as a green manure crop in California.

Black bitter vetch, black purple vetch, woolly podded vetch, horse

beans and the Tangier pea are promising new green manure crops in comparison with common vetch.

Green manure crops need no inoculation in California, horse beans in the northern portion being the only known exception.

Cow Peas Just Beginning to Come Up

This shows the method of leaving the furrows. This photograph was taken with the California Cultivator camera and unfortunately at high noon. The sun was shining so directly into the furrows that the small check dams show imperfectly. Lines have been drawn to indicate their location. This photograph was taken at the lower end of the furrows. The checks are intended to hold waste water. Back of where Mr. DeCamp is standing the furrows are straight and have no check dams.

The growing of a summer green manure crop in California orchards is not advisable.

Local as well as sectional conditions

in the various parts of the state vary considerably, and must be taken into consideration in determining the best crop for green manure as well as the

Fairbanks-Morse "Z" Farm Engines

KEROSENE

is king now that distillate is gone. It gives the same power, gallon for gallon, as gasoline, when used in the "Z" farm engine. Kerosene is the fuel for which this engine is designed. One of the many reasons why more than 250,000 farmers prefer this engine.

In the "Z" they bought dependable power—more than enough for every farm need for which the type you choose is adapted—dependable workmanship which has made the utmost of high grade materials—a correct design—aided by 200 Bosch Service Stations—all unified by the efficient service rendered by thousands of "Z" Engine dealers.

"Caterpillar"

Leveling Equipment

—a splendid profit-earner

The "Caterpillar" Tractor and "Caterpillar" Land Leveler are an ideal outfit for making waste acres productive by filling up the low spots and smoothing the rough stretches.

The tractor has ample power for this work, and the dependability that insures uninterrupted, trouble-free service.

The leveler—in a size for either the 45 or 75 "Caterpillar" Tractor—is simple, strong, easy to handle, can't get out of order, does the work *just* the way you want it done.

The two together—tractor and leveler—will level from 15 to 40 acres per day. Two men handle the outfit. The work is done better and more quickly than with any other animal or tractor-drawn leveling equipment, and at far less cost.

If you have land to level or roads to build, or want to add a sure money-maker to your custom outfit, send for full details of this outfit.

best method of handling the same. I take exception to the third from the last of Mr. McKee's conclusions, "Green manure crops need no inoculation in California." I do not say that this is not the case, but I do believe that with the slight cost of nitrifying bacteria, at first planting at least I would always make application. There can be no harm; there may be benefit.

HANDLING VEGETABLES

The California Vegetable Union, now handling some 5,000 cars of California

vegetables, finds it wise to get its various district managers to talk shop and have a social time. At a recent banquet at the L. A. Athletic Club, over 40 representatives of the big Union from Sacramento to Imperial gathered and filled themselves with new ideas and things.

The American Association of Nurserymen, a thousand strong, is meeting in Chicago this week. California is represented by George C. Goeding.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

June Bugs

I am sending a sample of a bug which has been doing a great deal of damage to our plum and prune trees which were planted this spring. This bug is found in the ground at the base of the tree through the day and it eats the leaves at night. We have just sprayed the tree with a solution of arsenate of lead, and there are lots of bugs falling to the ground and dying. Will this spray injure the young trees in any way, and will it be necessary to spray often? Would like to know the name of this bug and whether it will be apt to work on the other fruit trees. In our orchard we have also apple, pear, peach, apricot and cherry trees.—Subscriber, Fallbrook.

The bug which accompanied the letter had ceased to be a bug so emphatically that it was but little more than a brown spot on the letter. However, there were one or two portions which indicated that they might belong to the back of a healthy June bug, sometimes called May beetle. The attack of these pests is usually short-lived, and one application of an arsenate spray is usually sufficient to control them. Use four pounds of neutral arsenate of lead to 50 gallons water.

Ticks in Dog's Ears

Sometime ago you told us to try coal oil to kill the ticks in the stock's ears and to let you know how it worked. We put a teaspoon of coal oil in each ear and it did the work all right, but we have to repeat it about once a month, as the ticks seem bad here. We used the coal oil in the cat's and dog's ears with equal success and it does not seem to affect their hearing at all. We enjoy the Cultivator very much.—T. H. Toombs, Inyokern.

Curl Leaf

It occurs to me that some of your readers may be interested in an experiment I tried with "curl leaf" on my peach trees last year. I had failed to spray them at the proper time. When the "curl leaf" made its appearance I began pulling off the affected leaves and kept this up until it all disappeared, and saved all my peaches.—W. P. Russell, Claremont.

Avocados for Budding

The writer has tried to raise some avocado trees for budding. He planted hardy Mexican seeds in gallon cans. The seeds grew thriftily for several months, but finally the young trees began to fail and most of them died before fall. The trees were kept in partial shade and I think were watered sufficiently. The soil in the cans was a little heavy. Budded trees that I have purchased from the nursery were grown in redwood boxes holding less than a gallon of soil. Can you tell me what to do to grow these trees for budding?—Subscriber, Visalia.

The writer has grown many seedling avocados, of many sorts, in gallon cans, and has never lost any ex-

cept through lack of water. The young succulent plants need much moisture in hot weather. A better plan would be to plant seeds in the ground, protect them with a cover during the frosty period and dig the budded plants as balled trees. You will get superior stock in this way.

Cheap Paint from Cheap Oils

As you invite us to send in questions, I would like to ask you if transformer oil is good to make paint for buildings.—Subscriber, Inyokern.

We hardly think this oil would in any sense take the place of good linseed oil, but it is very probable that, reduced with a small portion of kerosene in some pigment like ochre, Prince's metallic or burnt umber, mixed to give body, this would make a very good paint for outbuildings or fences. Have our subscribers ever tried paint made from these refuse oils?

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Cows Break Through Fence

A has cows which break through the fence on B's place and do damage to growing crops. A refuses to pay the damages. How must B proceed to collect? Can he hold A's cows until the damage is settled?—Subscriber, Buena Park.

Where land is planted to growing crops, vines, fruit trees, or vegetables and entirely enclosed by a substantial fence or other enclosure, the owner or person in lawful possession of the land is entitled to recover by action in a court from the owner or person in possession of a trespassing animal actual damages sustained by reason of such trespass. He may have issued attachment process upon such animals, and for that purpose is not required to file affidavit of attachment, but such process shall issue upon filing his verified complaint. No animal is exempt from attachment or execution to satisfy a judgment which may be rendered against the owner of such animal for trespass committed by such animal.

School Attendance

My son is 15 years of age and has successfully passed the grammar grades. May I keep him out of school for a year and then continue?—Subscriber, Fallbrook.

The compulsory attendance law provides that children between the ages of eight and 18 years must be sent to public school during the time such public school shall be in session, with certain exceptions, in case affidavit is made that the child is attending private school or is unable by physical disability to attend school or that no public school is located within two miles. A further provision is that the child is exempt from compulsory attendance if he has completed the prescribed grammar school course, so that even a child younger than 15 years, if he has completed the prescribed course, is not subject to the compulsory attendance law.

Responsibility for Minor

We took an infant child who is now over 17. He has left our home and

gone to work for himself, keeping his own earnings. His father is still alive. In case he should contract debts or cause himself to be sued are we responsible for such debts?—Subscriber.

The child himself is only responsible for debts incurred for necessities of life. All other debts he may disaffirm with certain restrictions. The parent is responsible for the necessities of life furnished to the child, supplied in good faith by a third person, except where the child has abandoned the parent without just cause. In no case would it seem, where parties have merely taken the child into their home, would they be liable for the support of that child or debts incurred by him.

Pests on Land

Is there any law compelling owners to get rid of squirrels and gophers on their properties? Owner of land adjoining mine makes no attempt to trap or poison them. I am having continual trouble. They have already killed about two dozen of my young orange trees.—Subscriber, Rialto.

Under section 2322-A of the political code it is made the duty of the county horticultural commissioner in each county, whenever he shall deem it necessary, to cause an inspection to be made of any premises, and if found to be infested with animal pests injurious to trees he shall in writing notify the owner or person in charge that the same are infested and require such person to eradicate, destroy or control such pests to the satisfaction of the commissioner. Such notices may be served by any person in the same manner as a summons in a civil action, or by posting in a conspicuous place upon the premises and mailing copy to the owner at his last known address, if there is no one caring for the property. The section provides that orchards and premises infested with squirrels, gophers, or other destructive animals are a public nuisance, and after notice has been served and such nuisance has not been abated within the time specified in the notice, it is made the duty of the county horticultural commissioner to cause such nuisances to be at once abated by destroying the pests. The expense thereof is made a county charge, which the board of supervisors shall allow and pay and which shall thereupon become a lien upon the premises from which said nuisance has been removed; the property is made subject to the payment of such expenses together with the costs of action, which lien is prior to any lien upon the property except taxes.

CALIFORNIA'S AGRICULTURAL FAIR

(Continued from Cover).

The state maintains in the southern end of the state, at Los Angeles, a permanent exposition on the old Sixth District agricultural fair grounds. This exhibit is becoming one of the finest of its kind on earth. We have never seen anyone who claimed to have seen either in world's exposition or elsewhere, any exhibition of a state's resources better shown than are those in this permanent state building. This is the result of an intensive study by the management of the southern exposition. Hence, when President Roeding wished to visualize his dream and the dream of the board of directors as to the future of the state fair grounds at Sacramento, he asked the management of the southern exposition to create a model from the drawings of the architects. This model, in exact proportions, has been worked out under the immediate direction of Mr. Fowler, and W. N. Harris, acting manager. It is now at the exposition grounds at Los Angeles, but will later be at the state fair, and its perfection is worth a trip to the state fair to see.

The directors are dreaming of real things and laying plans for the working out of a great state exposition setting. It may be years before this dream is completed. It will be noted that the old tower, now so prominent, will give way to more attractive buildings and a quad effect will be secured by the erection of long buildings on either side the approach from the entrance to the great horticultural building already occupying the center of the grounds. The fireproof Woman's Building, already erected, is also a part of the permanent scheme.

June in the Vegetable Garden

Southern California

By D. F. Reichard

JULY is generally considered harvest month in California, but for the home gardener it is one of the big planting months, too. Those who have had a spring garden and are now and have been reaping its benefits in fresh vegetables are the ones who are most enthusiastic about a fall and winter garden.

To start a new garden at this time a thorough soaking of the soil before weeds and stubble is cleaned off or plowed under will be necessary. The water soaks in better with litter on the ground. If it is the spring garden you are getting ready to plant over, soak it by running the water in fur-

rows or by making checks as large as your water will fill without waste. As soon as the ground will work up nicely, break it up to a depth of ten or 12 inches and thoroughly pulverize. If your ground is handled properly there should be enough moisture to bring up seeds you plant without any further watering, but if the soil is too dry it is advisable to run furrows where the rows are to be and irrigate; then cultivate the furrow in and plant the seed. Do not plant seed in dry ground and then expect them to come up. Thoroughly wet and cultivate the ground, then plant the seed and they will be well up before any more watering will be necessary.

Seed and plants put out in the late afternoon get a better start than when planted in the heat of the day.

Plant for succession Kentucky Wonder and Stringless Green Pod beans; sweet corn; Eclipse beets; carrots; Iceberg lettuce; early radishes; Long Standing spinach. The later part of July, turnips, fall peas and white and red rose potatoes should be planted. Early in the month melons and casabas, as well as cucumbers and summer and winter squash may be planted and good results obtained. Sow seed of cabbage, cauliflower, Brussels sprouts, kale and Swiss chard for fall plantings.

Keep a close lookout for aphids and mildew and rust on your plants. Spray with nicotine extract for the former and Bordeaux mixture for the latter.

Use water and cultivator freely on all growing crops.

Vegetable planting calendar for Northern California and Southern Arizona on next page.

TRACKLAYER

BEST TRACKLAYER TRACTOR

A Recognized Leader

You have known of Best Tractors for years—you know men in your immediate vicinity who have successfully operated these machines—they will tell you Best Tracklayers are built right for heavy duty farm work—plowing, seeding, harrowing, hauling, belt work, etc.

The Sixty Model is generally recognized as the finest big power unit on the market. Its features include ease of operation—accessibility—no wheel, all track—no belts or chains, all gear driven—turns in own length—36 anti-friction bearings—manganese steel tracks—working parts completely housed—non-lubricated rocker joint in track, etc.

Catalog and full description will be sent upon request.

C.L. BEST GAS TRACTION Co.
San Leandro, California

AJAX CORD

EXCLUSIVE features built into the Ajax Cord combine to give the extra life and strength which "country" service requires.

First and foremost is the method by which these tires are constructed.

Each ply of cord is laid gently in position—*never pulled or stretched*. This means that full resiliency is retained, so that the tire can flex and give as it should when it strikes a rut or bump.

And that Cleated Tread—it holds like the heavy calks on a horse-shoe. And those "Shoulders of Strength"—they brace and re-inforce the tread.

There is exceptionally good mileage in Ajax Cords. Your car should wear them.

Ajax Cord, Ajax Road King, Ajax Tubes and Ajax H. Q. (High Quality) Tire Accessories, are sold by Ajax Franchised Dealers everywhere.

Northern California

By A. R. Gould

HERE space and water are not limited there should always be enough vegetables grown to store as a surplus in these days of high cost of living. Much of the surplus in the way of root crops such as beets, turnips, parsnips, onions, carrots and potatoes can be easily stored away in the cellar or may even be placed in beds made up outside. These root crops can be covered in dry sand or soil with the exception of onions which should be hung up. Squash and pumpkins are easily stored on shelves in the cellar and will keep for months. Peas and beans will also, of course, be valuable if stored in boxes, but it is always advisable to treat these by fumigating with carbon bisulphide to destroy any weevils which may cause trouble. As the various crops are ready to harvest, place them in storage and at once prepare the ground for further use.

The slight rains experienced last month were welcome to the gardener and helped some. It will be necessary to be on the watch for aphids in the vegetable garden, also the corn moth or ear worm. This last named pest is best destroyed by dusting with lead arsenate on the new silk, as it appears, and nicotine extract.

Onions

Keep this crop well irrigated and the cultivator busy between the rows. Some varieties will be ready to harvest. When the tops turn yellow and fall over they are ripe enough to handle, and care should be taken not to bruise them or they will not keep. After being dug, allow them to remain on the ground for a few days to dry out after which they may be tied together and hung up. Keep them in a cool place. Most of the main crop varieties will not be ready to harvest until next month or even September.

Cauliflower

If seed of this was sown last month as advised, sturdy plants should be ready to plant out towards the middle of this month or plants can usually be secured of the best varieties. Plant them in shallow trenches which should be previously watered. They

should be at least one and one-half feet apart.

Beans

Continue to sow for succession Golden Wax, Stringless Green Pod and Canadian Wonder. Keep those sown last month well cultivated to retain moisture.

Corn

Sow sweet corn varieties; Golden Cream, a very fine flavored variety, also the popular Country Gentleman and Golden Bantam. Sow about six seeds to a hill an inch deep and two and one-half to three feet apart. Irrigate between the rows three or four times during the month.

Parsnips

This excellent crop which should be more widely grown here owing to its high food value and keeping qualities may still be sown in rows 18 inches apart. It requires fairly rich soil. Hollow Crown is the best variety grown.

Kale

This is useful as a vegetable, also as poultry feed. Sow seeds of the tall green variety on a border. An ounce packet of seed will produce many hundreds of plants.

Carrots

For winter use sow now New Intermediate and Danvers Half Long. They thrive best on a rich sandy loam. Sow the seed in rows, very thinly, two feet apart.

Radish

Sow seed of these in rows 12 inches apart and thin the plants to three inches in the row. The varieties Crimson Giant Forcing and Half Long mature in about one month and a half from date of sowing seed. Winter varieties should be sown later in the year.

Lettuce

Make successional sowings of Los Angeles and Big Boston to have fresh tender salad for the table. Sow very thinly on well prepared soil. Keep well watered.

Southern Arizona

By M. E. Bemis

JULY is the month for beginning the planting of beans. All the pole varieties may be planted. Kentucky Wonder Wax should be planted the early part of the month, while Kentucky Wonder and White Seeded Kentucky Wonder should be planted the latter part. These varieties have been found to do well here, as also does the Broad Windsor. The bush variety should not be planted until August. Limas, Burpee's Bush, and the Large may now be planted. A peculiar bean, of Arizona origin, is called the Aztec. This was said to have been discovered in the old ruins of one of the cliff dwellings in the northern part of the state, sealed in an urn. The discoverer planted these beans, and some of them grew. I do not vouch for the accuracy of this statement, but the beans are unlike any others which are known. They grow in pods a foot or more long and the beans somewhat resemble Limas. They are of fair quality.

Pink beans, the frijole of the Mexican and a favorite with many Americans, may be planted the latter part of July. In some soils, especially the lighter sandy soils, they do very well, and where there are vacant places in the garden which are not utilized for any other purpose a few of these might well be planted.

July is the best month for planting the Mexican June corn, which is the best variety in the Southwest, is the best for general crop or for silage and makes most excellent roasting ears as well. The Pima variety, which I mentioned last month, may be planted any time during the summer. Another Indian variety, called the Papago, is also planted considerably. Both of these mature quickly and although the ears are small they are a desirable

variety for quick maturing roasting ears.

All of the grain sorghums may be planted in July. These include hegari, milo, kafir and feterita. The sweet sorghums are more popular than for several years owing to the high price of sugar, and where land is not too thoroughly impregnated with alkali it is advisable to plant some sorghums for making sorghum molasses. County agents throughout Arizona are encouraging planting of more sorghum for this purpose. The Honey Drip, Early Amber and Club Cane are good varieties for this purpose.

Cow peas may be planted in July, as well as practically every other month of the summer season. Many people enjoy an occasional dish of green shelled cow peas. The whip-poorwill is perhaps the most popular variety for Arizona.

Sudan grass might be planted where otherwise weeds would grow, and this would furnish a little chicken feed or would make hay. I find that a little patch of Sudan grass cut off when it is three or four inches high furnishes most excellent chicken feed at this season of the year. Rhodes grass is a new perennial that has come into popular favor in this locality the last few years. This is the time to plant it. It requires about five pounds of seed to the acre and will do well under rather adverse conditions. It is rather difficult to obtain a good stand of this grass, but it grows readily without very much irrigation when once established.

THOSE BICYCLING CHICKENS

"I have been instructed by the village council to enforce the ordinance against chickens running at large and riding bicycles on the sidewalk."—Alberta Advocate.

July in the Ornamental Garden

Southern California

By Ernest Branton

EXCEPT for fear of being dubbed a pessimist when asked about July gardening, we would say "don't." It is so much more comfortable to sit down and watch the flowering of the plants we set out in the cool, refreshing weather of springtime. As a defensive measure we ask: "Why should we garden in July?"

But geraniums and pelargoniums (Lady Washington's) propagate from cuttings in July as readily as at any time of the year. And heat loving annuals may still be planted or sown from seeds, while potted plants of all sorts may be set out if balls of soil are unbroken and plants shaded for a day or two from the sun. Seeds of Australian trees such as acacias and eucalypts are planted this month, also seeds of California trees and shrubs. Our plant growers are now sowing cypress seeds to get the small hedge plants you will want in the rainy season.

This is the season that tries the spirit of man, beast and plant. If you note plants that hold up under present hot spells, it is well to make an entry to that effect in your garden book, for with such should your garden be filled. Many plants are now ripening seed and the harvest should not be overlooked. Bulbs are also ripening and should be dug and stored in a dry, cool place. The writer is now digging daffodils, Spanish iris, dwarf gladiolus and all bulbs that bloomed at same season. Plant life quickly suffers from lack of soil moisture and few suffer from too much, so keep watering at a maximum.

When through with the garden hose, do not allow it to lie in the sun, for at no time does it suffer greater deterioration. It dries and cracks enough in one month's exposure to shorten its life of usefulness by one-half. If left with one end on the hydrant or with both ends high when full of water, the effect is still worse than when dry. The water left in quickly decomposes and so does the rubber lining. Empty the hose and hang in the shade. All garden tools and equipment age quickly if exposed to July weather and should be housed. To overcome this dryness and prevent checking the writer treats all wooden handles to a coat of linseed oil, either boiled or raw. Many handles crack and break through lack of such care. The oil also prevents them from getting rough and encouraging calluses on the hands.

Northern California

By A. R. Gould

SPECIAL care must be exercised this month as the newly planted subjects such as trees and shrubs will need every attention in regard to watering and neglect will mean the loss of the plants. Cultivate and water around each as often as the soil becomes dry. There are any number who plant trees and shrubs every year and for the first two or three weeks water them diligently, but after that they are expected to thrive for the rest of the year unaided, and if they die, as some of the more or less tender shrubs do, the nurseryman often gets the blame. To properly establish new plants individual care and attention is needed if you expect results, and, given this, the plants will respond. Many wonderful results are obtained in moving large trees. Almost impossible feats have been performed by landscape men in moving plants, but this means constant attention.

Watch for insect pests this month. Mr. Aphis will be busy on the roses and some of the shrubs, but they are usually enjoying the juice from the tender shoots and are easily recognized, being a green, brown or black fly which multiplies very rapidly and should be destroyed by a solution of nicotine extract which is about the only effective means of killing these sucking insects. Mildew on roses is a fungus disease, as also is rust, whether on the rose, hollyhock or snapdragon, and these must be spray-

ed with a solution of sulphur or Bordeaux mixture. It is necessary to state that where the plants are badly diseased it is a wise plan to burn them and the place where they were growing should be heavily treated with lime as the ground is covered with spores which winter there and the lime will prove of value.

Sweet Peas

The summer flowering types should just now be a mass of bloom, and to lengthen the display they should be given twice weekly a watering with liquid farmyard manure or an artificial fertilizer in the form of dried blood should be sprinkled along the rows. Cut the flowers freely and see that the vines have ample support. It will also be necessary to prepare the ground for the winter flowering types. Trenches should be dug at least two feet deep and stable manure well mixed in. Towards the end of the month seeds of the following choice varieties may be sown, and here we would remark that if the seeds appear hard, they should be soaked in water until they soften up. We recommend Early Warbler, mauve purple, Early Hercules, bright rose pink, Early Morning Star, orange scarlet, Early Liberty, blood red;

Early Peace, cream pink; Early Snowflake, pure white. You will appreciate the work of the hybridist on these, as some years of study have been devoted to producing a waved or Spencer type of sweet pea which would flower during the winter months, and the above include some very charming shades. Order the seed at once.

Cinerarias

As a subject for a shady situation these are ideal. They come in a wide range of color, are of tall, dwarf, large and small flowered types. Seed may be sown this month in boxes of fine soil and should provide strong healthy plants for the winter and spring flowering season. They thrive in a fairly rich soil. The dwarf varieties are known as grandiflora hybrida, the tall branching, as stellata.

Dahlias

Mulch these with manure and keep well supplied with water. To obtain large flowers disbud or take out the two side buds, leaving only the terminal on each stem to develop.

Subjects for Fall Flowering

Sow at once on a well prepared border where they are to flower nemesia Blue Gem, candytuft, mignonne, brachycombe and nemophila. When about half an inch high they

should be thinned out several inches apart to allow for development.

Campanulas

Some varieties of campanula are perennial but those known as Canterbury bells are biennials. Seed of these may be sown at once in boxes of sandy soil, and it should be possible to have strong plants ready to flower by the early spring. They make a fine display in groups. Campanula persicifolia is a perennial and is useful for the flower border, flowering early in spring. Plants may be secured now or seed may be sown.

Chrysanthemums

These very popular fall flowers should have all been planted in their flowering quarters ere this and will now require much attention. Apply plenty of water and cultivate frequently. To secure bushy plants pinch out the top growth to encourage branching.

Lawns

Remove all weeds and water regularly.

The county sealer of weights and measures of Orange County says that some worthless fertilizer is being sold to Orange County farmers. A recent shipment was detected in which there was 62 per cent sand.

When You Buy a Fordson Buy a Little Giant Belt

At the time you place your order for a Fordson Tractor order a Little Giant belt to go with it.

It is just as important to get this belt as it is to get your plow, for if you are farming efficiently, if you are going to get the greatest value for your investment in your tractor, belt work will form 40% of your tractor's operations.

It is highly important that you get the right belt. The belt that will deliver full power from your Fordson, the belt that has been especially designed for use with the Fordson tractor is the Little Giant Tractor belt.

The Little Giant tractor belt is a stitched canvas, endless belt and is made in three lengths—50 ft., 75 ft. and 100 ft. It grips the belt pulley in a way that eliminates slippage and loss of power and is so treated that it will withstand any sort of weather or climatic conditions and the exposure that a belt must endure in operating farm machinery. Extra stitching on the edges practically eliminates all the effect of edge wear and its special design makes the Little Giant run straight and true, always.

Get a Little Giant tractor belt from your Fordson dealer at the time you buy your Fordson tractor, or get it now if you have not already done so.

FOUR ROW AUTOMATIC LIFT BEET PLOW

Killefer
Efficiency

It Is None Too Early To Plan For Beet Harvesting

The above cut showing our Four Row Automatic Lift Beet Plow, the most practical beet plow on the market today, was designed for use behind the larger size tractors for plowing out beets at a minimum cost and saving not only time, but plowing deep enough to get the tap root which contains the greatest percentage of sugar.

The value of a good implement of this kind is not only in its ability to perform a perfect job of beet lifting, but in the condition it leaves the ground for next season's crop. Subsoiling has proven very beneficial on the Pacific Coast soils, and a good job of beet plowing is nothing more or less than subsoiling.

Our beet plow is equipped with either the straight wings as shown in the cut, or with angle wings, whichever is preferable.

Place your order early, for owing to the shortage of steel, there will be a limited number of these beet plows available.

Price f.o.b. Los Angeles, \$575.00

RHUBARB---Wagner's Giant Plant Now

July is one of the best months to plant. Growers who planted last July and August have already harvested over 15 tons per acre netting \$1,000 eleven months from planting. For further information write J. B. WAGNER, Rhubarb Specialist, 1550 East Villa St., Pasadena, California.

Capay Rancho

located on the banks of the Sacramento River, Glenn County. Recognized as the best deciduous fruit district in the state. Land irrigated by the famous Layne & Bowler, electrically-operated pumping plants.

Investigation will prove that this section offers more for your money than can be found elsewhere in this state. For example: 50 acres, suitable for fruit and alfalfa has a few magnificent oak trees, surrounded by highly improved properties, well equipped pumping plant, Price \$225 per acre. Terms.

40 acres, over half now in irrigated crops, 12 acres in alfalfa, small but neat improvements, land partially fenced. A real bargain at \$200 per acre, half cash.

72 acres, mostly river bottom land, a portion in alfalfa, four or five cuttings without irrigation. Good buildings, water under pressure, modern improvements. Land fenced. Offered for \$300 per acre.

These properties will bear the closest investigation. For further information or an appointment for seeing the land write to

CALIFORNIA CITRUS CONVENTION

(Continued from Page 3.)

ning a single furrow on each side with one horse. We disk early and later run spring tooth and chisel tooth, subsoiling once a year to 12 or 16 inches. We use horses and mules for general work and tractors for the heaviest.

"We sow cover crops in August and use several kinds, but find purple vetch generally best. Melilotus comes a little too late. For summer cover we have had good success with Black-eyes, sowing them thickly in rows 26 inches apart and plowing under in August. We plow furrows ten to 12 inches deep for manure and alternate with cross furrows next year, using ten tons to the acre each year. But on washy soils, those easily disturbed, we broadcast the manure. We have found a combination of bean straw and manure best. We also have orchards where there are strips of alfalfa between rows. This is also fertilized and at the end of four years is plowed under. This takes much water but gives improved color, though trees are not yet larger or fruit better. Two years after alfalfa is turned under test holes dug showed the alfalfa roots still there. To sum up in three heads: irrigation, cultivation, fertilization, I would suggest: make the runs short; plow early, before last rains; raise alfalfa and irrigate it."

Orange County Practices

C. B. Newman, superintendent of the San Joaquin Fruit Company's orchards at Irvine, said the farm labor question was a very important one and they had found it necessary to build good dormitories and provide amusements for single men and substantial cottages for married men.

In orchard practice frequent irrigations are necessary for soil is light. It has been found that June drop is not excessive where there is plenty of atmospheric and soil moisture. The winter feeding roots are near the surface and a hot spell dries out this top soil and drop results. Hold spring conditions of soil all the year if you can. Light soils are not so responsive to manure or fertilizers as heavier soils. He uses ten cubic feet of manure to each tree, applied in deep furrows, followed with a summer cover crop of cow peas.

R. S. Thompson of Highland, San Bernardino County, has been in the citrus growing business for 37 years and has found out that constant cultivation from May to October is not good practice. Since 1881 all organic matter applied to his trees has been grown in the orchard, and all are in fine condition. Livestock he has not found essential; cover crops and commercial fertilizer are sufficient. Exhaustive experiments have proven the value of cover crops as against any other method of applying organic material. Deep plowing should not be done more than once every five or six years.

Another speaker, from the audience, stated one of his orchards contained 190 old Navel trees that would pick but 300 boxes a year. They were cut off somewhat, thinned out, and the next year bore seven boxes to the tree and have been increasing in yield ever since, quadrupling to date that of the trees left unpruned. This year he bought a carload of nitrate of lime from Norway, applying two pounds to a tree, then tankage and again another application of the lime. He has found this good for olives and for lemons, but too much nitrogen for oranges.

Duty of Water

Professor R. S. Vaile then gave a talk on soil types and irrigation, in which he said we will never have enough water in California to irrigate all tillable land. Too much water is used in some orchards and in some sections the water table is rising at an alarming rate. Vigorous fibrous roots must be encouraged early in the season. Nearly all citrus roots are within two feet of the surface and all generally within four feet. A summer crop of melilotus running ten tons to the acre uses 1,000 tons of water. Orchards should be irrigated both ways, if possible, to encourage the fullest development of fibrous roots. Damp soil receives water much better than dry soil. "You know how hard it is to wet road dust." One inch of rain will go down six inches in dry soil, but a foot in damp soil in the same length of time. Two and a third

inches of water is all that can be retained in a sandy soil within the feeding area and is sufficient. The annual yield of alfalfa in Tulare County was not greatly increased by applying 60 inches of water where but 30 inches had previously been applied each year.

From San Diego County

The results of irrigation control at Chula Vista was given by F. M. Eaton. He said the Sweetwater system was fine and ample water supplied orchards at an average cost of \$20 per acre annually. The supply is not limited and the orchardist may use it when he lists. The soils about Chula Vista are variable, from adobe to sandy loam. Eighty per cent of the feeding roots are in the top foot. The distribution of water takes place only while running or very shortly thereafter, for where a bank of wet soil had a bank of dry soil placed against it the latter did not wet in one inch in 24 hours, the transmission being practically nothing. Runs of 300 feet are enough in light soil, and three or four irrigations all that are needed. Yellow leaf is due to excess of water. In the section but 16 acre-inches are needed each season. Every orchardist should know his soil well and to considerable depth.

C. B. Booth, Chaffey Junior college of agriculture, Ontario, then spoke on "Irrigation of Light Gravelly Soils." The distance of 660 feet, or across ten acres, is too far for water to run; 330 feet is enough. Grade of land is important. Water moving one foot per second carries silt. At two feet per second it carries 64 times as much; at three feet per second it carries 700 times as much. Thirty days apart is too infrequent irrigation. Twenty to 24 days is about right. Fifteen days is found preferable to 30 days, and it is better to run 12 hours every 15 days than 24 hours at 30 day intervals. To run water every 15 days requires but one and a half times as much labor and cost as a run at the end of 30 days. Roots of oranges were found to penetrate 13 feet. Irrigation is as much concern to a community as marketing. By using just enough water one orchardist saves but little, but all together save much and in a year of shortage may mean the difference between success and complete failure.

In Ventura County

"Irrigation of Medium Loam Soils" was the subject discussed by J. M. Culbertson, assistant manager of the Limoneira Company, Santa Paula. "The best land grade for irrigation is from one to two per cent; if it exceeds two and a half per cent it should be irrigated on contour lines. Our runs are from 225 to 400 feet long, usually 300 feet. Irrigations are five or six weeks apart and four to eight acre-inches given at each time. The third irrigation is generally in August. In September we plant cover crops and turn them under in February. Barn yard manure helps percolation much. The usual orchard practice in California is to use 18 to 30 inches of water a year; at Limoneira we apply 40 to 70 inches. When we used from 19 to 29 inches for two years we found it insufficient; the crop was reduced, also size of fruits. The penetration was but four feet and alkali was found to have lodged there. It should have been carried deeper. To summarize: Five weeks apart and five acre-inches at a time is enough, and because of alkalinity our soils need more water than lighter or freer soils. Furrows of 330 feet are enough in any soil. Water should reach the end of the furrows in one-fourth the time it is to run. Use the soil auger frequently."

W. P. Kelley of the citrus experiment station at Riverside spoke extemporaneously on methods of applying fertilizers. The roots in average soils are found mostly in the top two feet and nearly all within the top 20 inches. In grain fields fertilizers are applied before planting and are therefore placed where they are to be used, but in orchards they must be moved again by some agency before roots can get hold of them. Actual contact with roots is necessary. Nitrogen must get into nitrate form before available and all is then soluble and must not be washed down too deep, for it is irrecoverable. Phosphoric acid and potash move through the soil to a very limited extent, no matter in what form applied. The first few top inches get and retain all; they will not spread. On thousands of acres of phosphate application in California it never comes in contact with

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the purest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men \$4 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 110 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%. Send for Circulars No. 6 and 7.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 degree BE., etc., Fungicides and Insecticides.

Carried in stock and mixed to order.

MORGAN HILL - CALIFORNIA

the roots it should feed. After 12 annual applications soil samples were taken at one, two, three and down to ten feet deep. In 20 plats no phosphoric had gone below the first foot during the 12 years and none was found below the top foot in excess of the amount in nearby virgin soil. But the amount of phosphoric acid had doubled in the top foot in the orchard, over that in adjoining virgin soil, while the roots were nearly all in the second foot! To increase efficiency we must do one of three things; Put it deeper in the soil; ameliorate soil conditions to bring about greater exchange between upper and lower soils; make soil tubes through deep rooting plants or induce roots to come up."

Ranch Labor

A survey of the labor situation was given by George B. Hodgkin, field department California Fruit Growers Exchange, in which he said: "Associations of orange growers, canneries, railroads and other interests are largely solving the problem by providing proper housing, especially for married men. A study has revealed a one year job employs 12 single men, or an average of one man a month, but a similar job holds a married man one year. The majority of ranch labor is Mexican, but no Mexican is satisfied with merely eating and sleeping. He needs relaxation and amusement. Mexicans also have to be taught the uses of modern cottages and equipment, a matter of education which they are quick to appreciate. They have to be first forced into education but soon become eager for it. It is hard to get results from men you cannot talk to. Education of the Mexican in the past has been regarded as purely philanthropic work, but that is the wrong view of it; it is an economic necessity. Get Mexicans to build their own homes by making the acquisition easy. Present your problems to your employees, especially heads of departments, once or more a month for discussion. Bonuses, awards or rewards encourage and also accomplish much. Seasonal labor is bound to be transient and unsettled, therefore study to provide steady employment, even if you have to find outside work for some of your men.

F. A. Pomeroy, manager of the San Fernando Citrus Association, also spoke on the same subject. He said: "We employ mainly Mexicans, with a few Japanese. Study your men and find out to what each is best adapted. Try to find steady employment close at home during the non-picking season. Just last week we found some of our men jobs on neighboring ranches growing other than citrus crops. We are also building good cottages for them; don't let them live in shacks. You can then soon get a better class of laborers."

The last speaker of the institute program was Professor H. J. Quayle of the citrus experiment station, Riverside, on "The Orange Tortrix." Some dozens of infested oranges were distributed through the audience. Professor Quayle said: "It is estimated that in some sections 25 per cent of the crop is infested by this pest and the matter is becoming serious. The damage occurs somewhat every year, worse in some years and in some sections than in others. The burrow is shallow, only extending through the skin, to the pulp. The burrows not only mar the fruit but induce decay, are difficult to detect, and fruit may decay in transit. Fruits drop from trees after infection, and as they prematurely turn yellow, may be detected on tree. The tortrix also attacks other trees, such as apricot, willow, walnut and several ornamentals. It is sometimes a borer, sometimes a leaf roller. It is not yet serious over large areas and no systematic control measures have been taken, but we are now coming to it. Spraying with arsenate of lead is most efficacious and some have used that mixed with lime-sulphur to catch red spider at same time, but the two should not be fought at once as seasons are unlike. Early spraying in May with one-fourth pound of arsenate of lead to a large tree will cost but six or eight cents per tree for material."

The Easter freeze in Eastern peach growing sections has seriously cut down the crop. It is now reported that Arkansas and Oklahoma will have no peaches at all.

“ Modernization of farm labor-saving devices as a means of increasing production is a report made public today by the agents recently conducted a survey of planning and well-directed investment in a large part of the present waste of energy.”
—Associated Press Report

DELCO

THERE'S A SATISF

9

WIDESPREAD WASTE in farm homes throughout the land is revealed by the recent survey of the Department of Agriculture—waste of fuel for light and power and waste of energy. To increase their profits and get greater results from their energy, farmers are urged by the government to invest in electrical labor-saving and fuel-saving equipment such as DELCO-LIGHT provides.

GASOLINE and FUEL OIL for power development—coal for ironing, cooking, washing, etc.—are among the big items of WASTE on many farms. How about YOURS? The DELCO-LIGHT engine is specially designed to use MONEY-SAVING KEROSENE, the cheapest fuel on the market today. More than 100,000 satisfied users of DELCO-LIGHT are not only reaping profits but also conserving the Nation's swiftly-diminishing supply of fuel oil and coal.

8

YOU HAVE THE MEANS of adopting the government's suggestion for stopping wastage on your farm and increasing your profits. DELCO-LIGHT provides them. We install the plant ready for service on your farm. Pull the starting lever on the kerosene-burning, air-cooled engine and service begins—lifetime of it.

DELCO-LIGHT dealers are authorized to offer terms on which you can purchase a plant at once—it will be paying for itself before fall crops are harvested. Place your order today. Put the plant to a 30-day test. If you are satisfied with its performance—as are 3,000 users on the Pacific Coast alone—make your choice of the following terms of purchase:

LIGHT

USER NEAR YOU

TO CHECK LABOR WASTAGE—to free the woman-power of the country from unprofitable toil and drudgery—the government recommends the general use of labor-saving devices such as are operated economically by DELCO-LIGHT. You know it's hard to get help these days. Put DELCO-LIGHT on your farm and your worries over the labor problem will end.

DELCO-LIGHT NEVER QUILTS WORK, never loafs, never quarrels about wages. Feed it a few cents' worth of KEROSENE each day and it keeps on the job a lifetime. In addition, it fills the farmhouse and outbuildings with brilliant electric light whenever wanted. Any member of your family can run the plant easily—get the most out of its abundant storage of light and power.

PART PAYMENT, and balance in six months; or, four equal payments, beginning with your accept of DELCO-LIGHT, and remittances at the end of three, six and nine months; or, cash on delivery. Whatever payments you have made will be returned if, after the 30-day test, you want the plant taken out, without any expense whatever on your part.

By ordering a DELCO-LIGHT today you can secure immediate delivery. Begin at once to enjoy comforts and labor-saving, profit-making devices that the government recommends. Stop the wastage that is bound to continue on your farm until you install the complete electric light and power unit provided by DELCO-LIGHT.

Elmer Lamb of Ceres writes in regard to some of the animals he will sell on Wednesday, July 21; "Orion Cherry Pathfinder is developing into a great boar. Being a son of Mary Jane Pathfinder by Pathfinder, and Orion Model by Orion Cherry King Jr., he cannot help being good. At 18 months he weighs over 700 pounds, just in breeding form, is a boar of immense bone, great smoothness and feeding quality. Being a grandson of Orion Cherry King Jr., Taxpayer, Pathfinder and Grand Model, he carries the best blood of the breed. Sows and gilts bred to him should be attractions in the sale. Mary Jane Pathfinder, his dam, is rounding out in fine shape and can easily be conditioned for the fair this fall. She was junior champion at the state fair in 1918 and in addition to being a show sow is a great producer. In her last litter she had 15 pigs and raised 11. In the sale are three boars and four sows out of her that bear testimony of her worth. Also in the sale are four gilts sired by Orion's King Gano and bred to Orion Cherry Pathfinder."

The Winsor Ranch at Bonita, San Diego County, has recently acquired an excellent foundation in Guernseys from the noted Dupee herd at Santee. The new acquisition consists of a dozen females, with a crack young show bull at head of the herd. This young fellow is a half brother to the grand champion at the National in 1919. His sire is Itchen May King, dam Veda of Checona. He will be seen in the big show circuit this year.

Derryfield Farm, Sacramento, is a well known center for big type Durocs. The sire in service is Pathfinder Wonder, a son of Great Wonder I Am, and out of a Pathfinder dam. Just now there are some attractive offerings in tried sows and yearling gilts, all to be mated to the big boar Pathfinder Wonder. Blood lines in the herd run direct to Model Col., King's Col., Crimson Wonder, Golden Wonder and Burke's Good E. Nuff. At 15 months Pathfinder's Wonder stands at 500 pounds, 37 inches high, and 71 inches from eyes to root of tail.

As superintendent of cattle for the Southern California fair at Riverside George W. Thomas has won for himself and for the fair well deserved popularity. Mr. Thomas is well known also as a senior member of the firm of Geo. W. Thomas & Sons at Arlington, breeders of high class registered Jersey cattle. The ranch is an ideal one in all respects, being well equipped with comforts and conveniences designed to develop all the good traits of the breed. Mr. Thomas pins his faith to the official test, and the good work goes on accordingly.

William Hemphill, manager of the Paderewski Ranch at Paso Robles, has just heard from Mr. Paderewski, who states that he is returning to Poland to sever his connection with that government, after which he will proceed to Paso Robles to make his permanent home at Rancho El Ignacio.

It is reported that Kenneth Abbott, formerly with Burr Farm, later at Sacramento, has now secured an interest in the Burr Farm Holsteins and is to have active charge of the herd. With the expansion of the herd and test work, Manager Geo. M. Brown found that he had too big a one man

job. There are now 46 cows on semi-official test at Burr Farm.

C. J. Gilbert, known as one of the leading breeders of Hampshire swine in this state, having disposed of his Antelope Valley ranch properties, has associated himself with Edgar Rice Burrows, author of the popular Tarzan stories, in the breeding of high class Hampshires in the San Fernando Valley. The Gilbert herd is now installed at the Burroughs ranch near Owensmouth and will form the nucleus around which to build one of the leading show and business herds in California.

Newton's Arenal Ranch at Lankershim seems to have had what some people call "luck" in raising many fine pigs this year of 1920. At any rate, the pigs are there—plenty of them. There are 100 March pigs and they have lots of size for age. They come of strong even litters, too. Those who visit the ranch say "It isn't all luck." It is system, attention to details at the right time, comfortable quarters, good feed, pure water and plenty of open pasture room. Trade is reported to be picking up on these March youngsters. Then there are some very excellent September boars and gilts ready for use now. You see pedigrees for every animal at the ranch.

Fred Rood, for many years field man in the Iowa territory for the American Swineherd, and one of the best known Poland China breeders in the country, is making a tour of California in an effort to regain his health. Mr. Rood likes the appearance of many of the California herds and may possibly locate permanently and establish his herd of Polands in this state. He will spend the next month visiting throughout the Sacramento Valley and return to Iowa in time for the sale season, which will start about August 1.

Recent sales reported by A. Buckland & Son, Fresno, include the herd boar Blue Valley King to Reasnor Bros., Athlone. Also several weanling pigs for pig club work in Los Angeles County.

A large number of Duroc breeders were in attendance at the meeting held in Fresno, June 24. While no really definite move was made, the question of a breed promotion field man was discussed and plans are being made to finance the movement. This is a matter of great importance to every Duroc breeder in the state and it is to be hoped that it will receive the support it deserves.

At a recent sale of Shorthorns held in Missouri two yearling daughters of the Caledonia Farms herd bull, Imp. Caledonia, sold for \$1,500 and \$1,475.

In five Shorthorn sales held at Marysville, Missouri, recently, 277 head of bulls and females were sold for an average price of \$1,086.

The second annual Pork Day will be held at Hanford, October 28. The following prize list has been announced: Carload class (70 hogs to the car)—first, \$350; second, \$280; third, \$210; fourth, \$140; fifth, \$70. Additional prizes will be offered for pens of ten and for individual barrows. New classes have been provided for boys' and girls' clubs.

Professor R. F. Miller has arrived at the university farm and will serve as acting head of the animal husbandry division during the coming year, while Professor True is away.

The first annual meeting of the California Dairy Council will be held at Hanford, July 14-15. The two days will be crowded with entertainment, ranging from speech making to a barbecue.

At the annual meeting of the Kings County Poland China Breeders Association held at Hanford Monday, June 14, it was decided to hold the next semi-annual sale of the members at Hanford on October 6. All officers were reelected for the coming year.

RECORD PRICE FOR SOW

In the Cultivator of June 19 report was made of the record breaking sale of the senior yearling Duroc boar Great Sensation 3rd by Winsor Ranch, Bonita, for \$8,000. Winsor Ranch also holds the record for selling the highest priced sow ever sold by a Western breeder. The sow was High Lady Sensation, and sold for \$2,000. She was bred to Great Sensation 3rd and

with the last ram offered on the second day. This ram, a registered Rambouillet from the famous Bullard Bros. flock, Woodland, and typical of the type this firm has been producing through their well directed and constructive efforts, was bought by Eibe and Huffman of Glenn County for \$250. Other consignments from the Bullard flock were generally appreciated. An especially good buy consist-

High Lady Sensation

A fall gilt of the Winsor Ranch recently sold to Edgemore Farms for \$2,000. She is sired by Orion Sensation, the first prize senior at Iowa last fall, and is a littermate to the world's grand champion, Great Orion Sensation. She was bred to Great Sensation 3rd the junior herd sire, and farrowed 15 fine pigs. She is raising 13 with a nurse sow's help for two of them.

farrowed 15 pigs, of which she raised 13, with the help of a nurse sow for two of them. She is a litter mate to the Cummins sow of Visalia that topped the Winsor Ranch sale last

winter and with the help of a nurse sow is raising 14 out of her 15 pigs.

A large number of sows bred to Great Sensation 3rd will be offered in the coming sale of Winsor Ranch at Los Angeles.

FIRST RAM SALE A SUCCESS

The first ram sale ever held in California was held under the direction of the California Wool Growers Association at the university farm, Davis, June 24-25, and the results were of such satisfactory character that it is quite certain that the sale will be made an annual event. No effort was made to attract extremely top consignments, as the initial sale was more of an experiment. However, the general quality of the offering was entirely satisfactory and the prices paid, for the most part, represented values that were profitable to both the sellers and the buyers. A distinct preference was manifested for the better things, but there appeared to be no unusual or pronounced demand for any one breed. Good Rambouillets, good Hampshires and good Shropshires were in favor. The plainer things and the lesser known cross-breeds sold at bargain figures.

The top of the sale was reached

ed of ten registered yearling Bullard ewes that went to J. E. Harby of Davis for \$70 around.

C. Harold Hopkins, whose ranch is near Davis, was represented by a very attractive lot of registered Hampshires. They were presented in nice condition and with plenty of size, and were eagerly taken at an average of \$110, the top going to V. F. Dolcini of Davis for \$130 and the top pen of the sale selling for \$110. Joe Levy of Manteca was also a contributor of Hampshires, but his consignment was handicapped by a long ship.

Among the Shropshire breeders, the flocks of Butte City Ranch, Butte City, and Col. J. W. Marshall of Dixon divided honors for top places. The former flock sent in the top lamb of the sale and secured from the Marshall flock one of the top stud rams. Marshall topped the Shropshire division with a ram that sold for \$140.

The sale was managed by Fred W. Ellinwood of Red Bluff and Professor James Wilson of the university. Col. Ben A. Rhoades of Los Angeles was the auctioneer.

IMPURE SALT INJURES HIDES

Recent experiments have shown that the use of impure salt on green hides produces a low grade of leather. Much of the salt nowadays contains alum. This element when applied to hides partly tans them and sets the hair. When the hair cannot be removed the tanner experiences a loss and thereby becomes prejudiced against the producer who, in the future, may find it difficult to dispose of his hides.

Use pure, clean salt on the hides in order to produce a high grade of marketable products. A very small percentage of alum may be detected in salt by the astringent bitter taste.

Veterinary

Cow Constipated

My cow has been fed green cut Napier grass, bran, alfalfa, etc., but has been seriously constipated. She was relieved by veterinarian and is now eating alfalfa all right but refuses to eat the grass. Was the Napier responsible?—Subscriber, Los Angeles.

I would suggest that you drench your cow with a quart of raw linseed oil. Then follow this up by only light feeds of bran mash and alfalfa with ensilage or some green feed if possible. If her appetite does not return I would suggest that you repeat this treatment in about three days. The trouble is probably due to some intestinal disorder which the raw linseed oil should overcome.—G. E. G.

Lendorris Liberty Bond, Skyrocket and Lendorris Liberator,

Three good sons of three good sires are our herd boars, and are backed by a sow herd of such uniform excellence and approved blood lines as to assure satisfaction to the purchaser of Poland China breeding stock. We have some choice individuals of various ages for sale at all times. Write us for prices.

W. L. Haag and Son

Hanford, Cal.

Do You Know?

That The Westerner is a half brother to the Junior, Senior and Grand Champion sows at the last National Swine Show.

That his half sister (the Junior Champion) sold for \$5000, the record price for an open gilt.

Remember that The Westerner is from a family of "mighty good folks" and that we sell sows bred to him in our Sept. 27th sale.

TWO DAY AUCTION SALE

Famous Conejo Ranch Herds

Duroc-Jersey and Hampshire

For years the Conejo Ranch has been recognized for the high class pure bred hogs in both Duroc-Jersey and Hampshire breeds that they have raised. At every stock show for the past few years Conejo animals have been prominent in the championship and first prize classes. Every year the standard of the Conejo hogs has been raised with the result that this ranch today is able to offer a remarkable big type preferred by all breeders.

All sales of Conejo animals in the past have been made privately, but the management has decided on a new policy of two sales yearly. These two sales for this year are announced as

Thursday, July 29th Duroc-Jersey Sale

Friday, July 30th Hampshire Sale

The offerings in both classes will be carefully selected bred gilts and a few tried sows.

Make arrangements to take in this sale. Barbecue will be served at the ranch. Its location is forty miles northwest of Los Angeles on the Ventura State Highway. If you are coming by train notify our Los Angeles office regarding transportation desired.

Conejo Ranch

Newbury Park, Ventura County

Los Angeles Address:

Janss Investment Company, 4th Floor Metropolitan Bldg.

COME TO THE

Great Dispersal Sale of Lamb's Durocs, at Ceres, Cal. Wednesday, July 21st, 1920

Offering is sired by such boars as Pathfinder, Orion Model, Orion Model Jr., Orion Cherry Pathfinder, Orion's King Gano, Lord's Orion Cherry King and Grand Wonder. Thirty sows and gilts bred to Orion Cherry Pathfinder, the big grandson of Pathfinder and Orion Cherry King Jr., Lord's Orion Cherry King, First Prize senior yearling at Sacramento last year, and Donald Orion Gano, a good son of the great boar Orion's King Gano. About forty open sows and gilts and ten boars complete the offering. Catalogues out in a few days.

ELMER LAMB

CERES, CAL.

CALIFORNIA BUTTER AND CHEESE CONTEST

By G. D. Turnbow

The first scoring of the 1920 California Educational Butter and Cheese Scoring Contest conducted by the dairy industry division of the university farm was held in Davis on June 11. Eleven samples of butter and six of cheese were entered for scoring. T. J. Harris of San Francisco, S. L. Deming of Oakland and G. D. Turnbow of Davis were the judges. G. R. Jaehrig of the university farm received 93 commercial score. L. Diamond of the University Farm Creamery received 96.3, the highest score where the commercial and composition scores were averaged. O. Ghigglioli of the University Farm Creamery received a score of 93, the highest score on cheddar cheese. Mr. Ghigglioli has won in fair and other contests before but this is the first time that the University butter has won over the other creameries in a similar contest.

Butter Scores

Following is a list of the entries which scored 90 or above on commercial score:

J. Reeder, Western Refrigerating Co., 91; Fred Peter, Montague Creamery, 89; Harry Wolf, Crystal Cream & Butter Co., 91; Milton A. Silva, Salinas Creamery, 92; M. H. Crasby, Hooper Creamery, 91½; Bodega Cooperative Creamery, 91½; Julian Serles, Scott's Dairy, 91½; J. F. Morrison, P. M. Dairy, 88; Watsonville Creamery & Milk Dept., 91½; G. Jaehrig, University Farm Creamery, 93; L. Diamond, University Farm Creamery, 92½.

Cheddar Cheese

J. A. Jack, Reber & Woodmanse, 91; John Reber, Reber & Woodmanse, 90; O. Ghigglioli, University Farm, 93.

Butter Very Uniform

The butter as a whole was a uniform lot. The average score of the 11 samples was 95.25. This average includes both the commercial and composition scores. Some of the entries were cut quite severely on an old cream flavor and neutralized flavors were not uncommon. Considerable harm can be done to butter if the cream is neutralized too low. For all practical purposes reducing the apparent acidity to .25 per cent is all that is necessary and unless very high acid cream is used no neutralized flavor in the butter will result. It is impossible to guess at the acidity—make acid tests. The butter as a whole was cut but little on the body. Only one sample in the lot was criticized for being short grained. In composition (which rests almost entirely upon the skill of the buttermaker), scores were exceptionally high, the lowest composition score being 96 while perfect composition scores predominated. This was not the case a year or so ago.

Cheese Entries

Some of the cheese was not of the best of quality; poor milk was undoubtedly the cause of most of the trouble. Part of the cheese was too green to score to an advantage. The workmanship on the entire lot was very good.

The next scoring contest will be announced later and it is hoped that a much larger number of samples will be entered. If there are any suggestions regarding the contest the dairy industry division at Davis will be glad to receive them.

SONOMA COUNTY'S DAIRY IMPROVEMENT CAMPAIGN

In connection with the regular monthly meeting of the Bodega-Valley Ford farm center, the recently formed dairy department of the Sonoma County farm bureau held an all day better dairy stock demonstration on Thursday, June 10, on the farm of J. A. Mache at Bodega Roads.

Professor Rubel of the University of California conducted a demonstration of judging correct type of dairy animals. Between 40 and 50 head of the best dairy stock in western Sonoma had been assembled, many of them cows that had been under test in the Bodega Cow Testing Association for several years. Several pure bred sires of merit were led out and several heifers shown, along with their dams and sires, and by comparison the fact was demonstrated that the influence of a pure bred sire in im-

proving the standard of stock was beyond question. The value of cow testing was also ably demonstrated when some very ordinary cows were brought out whose production records were given at 400 pounds and better, while other promising looking animals, with production records considerably less, were shown in comparison.

Samuel H. Green of the State Dairy Council urged the dairymen to get behind the movement, pointing out the great need, at this time, of unified action of the dairy interests.

J. R. Gallagher of Bodega, chairman of the dairy department of the county farm bureau, handled the arrangements for this meeting, which is one of the first of a series planned to be held in the future.

In connection with the activities of the dairy department of the county farm bureau, increasing the number of cow testing associations in the county for the coming dairy season is foremost. A pure bred bull sale is being arranged for the latter part of September, to be held at Petaluma, at which sale it is expected that not less than 25 pure bred bulls of merit will be placed in the hands of Sonoma and Marin County dairymen.

CALIFORNIA LEADS IN PRODUCTION OF BUTTER FOR NAVY

William White of the dairy division, United States department of agriculture, has been on the Pacific Coast to procure inspectors for the navy butter now being made in three plants in Humboldt and one plant in Del Norte County.

The navy butter contract with these four plants calls for 850,000 pounds of butter made from unripened pasteurized cream. No single can of cream may contain over 0.23 per cent acidity. The butter must score 94 per cent and contain not over 13.5 per cent moisture. It is packed in six pound six ounce tins. Located in each of these plants making this butter is an inspector whose duty it is to examine the raw material, score the butter, run salt and moisture tests and see that a high standard of sanitation is maintained in the plant at all times. A portion of this 850,000 pounds of butter will be put in storage on this coast for the Pacific fleet and the balance shipped East, presumably to Hampton Roads, for storage.

It is estimated that it will take about two months to fill this Pacific Coast contract. There is a similar contract for navy butter, but considerably smaller, being filled in Minnesota.

WHEN TO CUT CORN FOR SILAGE

The feeding worth and palatability of good silage depends on the quality of the corn and the period of maturity at which it is cut. Where the corn is cut when it is immature, not well glazed and dented, and still in its juvenile stage, it makes washy, low quality, acid forming silage which is likely to sour. On the other hand corn harvested when it is well dented and at the proper degree of ripeness for best use as silage, gives a winter feed which is one of the best producers of milk and meat. Corn should be allowed to pass well through the milk stage and become thoroughly dented before being siloed. Investigations of the United States department of agriculture have demonstrated that it is much preferable, for silage of the best quality, to have the corn a little overripe rather than underripe.

In some sections farmers, and particularly dairymen, are accustomed to ensile combination crops, using mixtures of soy beans and corn, cowpeas and corn, sorghum and corn, or a combination of these three for canning purposes. As a general proposition, where other branches of animal husbandry in addition to dairying are taken into consideration, corn or some other coarse forage is most desirable for ensilage purposes. Acre yield is the end sought, the chief objection to the valuable protein forages such as cowpeas, soy beans and the like being that they are low yielders better adapted for hay than for silage. Dairy farmers who require an abundance of succulent silage of a rather balanced composition highly prize the leguminous crops mentioned as supplements to corn and usually realize an adequate return from the sale of their milk to allow them to produce these crops at a profit.

Beet Top Silage a Hay Substitute

Stock growers having a sufficient quantity of sugar beet tops can reduce their hay requirements by approximately one-half by using their beet tops for the production of silage. This information is particularly valuable at this time because of the present hay shortage. When this silage is substituted for a portion of the hay normally fed it is found that beef and mutton gains continue on a normal basis. Many beet growers contend that beet tops are worth from \$10 to \$12 an acre when grazed. Where the beet grower does not have stock to utilize the pasturage it is common to sell the tops to stockmen at from \$3 to \$6 per acre, or even higher. In the absence of complete data from well defined experiments in feeding beet top silage, the department cites the experience of several careful feeders as indicating the genuine value of this by-product of the sugar beet field. One large cattle grower reports that the shipping "shrink" on cattle fed and "finished" by using beet top silage as a generous part of the ration, is not greater than the "shrink" commonly had with cattle that are fed and finished with grain, alfalfa and concentrates.

Persons who have not used beet top silage are cautioned to feed it lightly at the start. It is also important that moldy silage found on or near the surface or sides of the silo be carefully removed and destroyed, as such food is even more dangerous than moldy hay or straw.

Harvesting and Preparing

The essentials involved in making good beet top silage are substantially those necessary to making good corn silage. The mass should be packed thoroughly to exclude the air and then sealed air-tight. It is not necessary to run the tops and crown through the silage cutter, though some feeders prefer to do so to avoid the possibility of choking animals on the crowns.

The average cost of gathering the tops and piling, packing, and finishing the silo is approximately \$1 per ton. As a preliminary step it is particularly important that the tops be gathered and put into small piles promptly after the beets are topped, and that the dirt and sand be removed. This can be easily done by shaking the tops well while the leaves are fresh.

A structure commonly used for putting up corn silage is entirely suited for beet top silage. Because the beet tops pack very densely the structure may sometimes crack under the pressure and thus allow air to enter. However, a silo well built is reasonably safe. If one does not have an ordinary silo, cash outlay is not necessary to make beet top silage, for a natural earth silo can be used quite satisfactorily. The earth pit which can be quickly made by the use of a team or scraper should be deep and narrow in stead of wide and shallow. Under certain conditions concrete side retaining walls are advisable for such storage places, but ordinarily the earth sides and bottom covered with straw have been found satisfactory. When the natural earth silo is used special care is necessary in packing, and, after filling, the top should be covered with beet pulp or earth to exclude the air.

An excellent quality of silage can be made by merely stacking the tops and crowns entirely above the earth and then packing them thoroughly. Of course the spoilage is greater in such a case than when the structure or pit silo is used. Many stock raisers lay away a supply of sugar beet pulp for winter feeding.

Pulp, another by-product, is the fibrous mass that remains after the saccharin matter has been removed from the sliced beets commonly called "cossetts." The best way for the grower to store a portion of this pulp for winter feeding is to spread it on the top of the beet tops in the silo. This effectually seals the silo and prevents the silage mass from freezing. At the same time the heat from the silage warms the pulp, thereby hastening its curing and rendering the pulp as well as the silage excellent for stock feeding.

Suggestions for Proper Feeding

Silage is not a balanced ration, but, being a carbohydrate feed, it goes well with alfalfa hay which is rich in pro-

tein. Fermentation in the silo corrects the cathartic salts in the beet tops and crowns. The best feeding practices show that the beet top silage reduces hay requirements one-half in feeding for beef or mutton or milk production.

Beet tops will increase the flow of milk with ewes at lambing time. It is best to start feeding only about one pound per head per day and gradually to increase to about three pounds per day.

From the standpoint of costs it is interesting to note that the by-products of the sugar beet crop, when properly handled and fed, have a value equal to the entire cost of the so-called "hand labor" required in producing the beet crop. If properly conducted, the feedings of the by-products will yield a net profit equal to about one-half of the net profits usually had in growing and marketing the beets themselves.

GIVE THE HOGS A FISH COURSE

The common domestic pig will never be able to write a book on table manners, but he knows how to order a meal as well as anyone. He is in a fair way to demand a fish course to supplement his salad and vegetable diet. He will take his fish in the form of fish meal, the refined by-product made from sound, wholesome raw material at the sardine, tuna, and salmon canneries, or from the menhaden.

The fish meal is not to be confused with "fish scrap," a coarser by-product much used for fertilizer; the meal is made from clean, sound material and is intended to be used as food for cattle and hogs. Formerly, the cannery waste was all made into "scrap" for fertilizer purposes, but the bureau of chemistry, United States department of agriculture, knowing the extremely high protein content of the scrap, has been active in converting this material into a high grade protein feed. The cleaned, selected portion is ground to a fine, palatable meal which may be used to replace tankage in hog, poultry, or dairy rations.

Fish meal has been recommended as a supplementary ration before now, but popular prejudice against a badly prepared product has discouraged its use. The department of agriculture has proved by feeding experiments that fish meal equals the high priced tankage as a ration ingredient, and better methods of selecting and milling have removed the causes of prejudice.

The oil content of the meal adds materially to its feeding value. So far the experiments have shown that the meal does not taint the animal product, whether it be pork, butter, eggs, or milk. Moreover, by diverting the fish meals to his animals instead of supplying it directly to his land as fertilizer, the farmer loses but a trifle of its fertilizing value and gains its entire feeding value—thus making the material yield two profits in the place of one.

LET YOUR BULL INDOSE YOUR NOTE

The better sires campaign conducted by various states in cooperation with the bureau of animal industry, is developing the fact that bank credit is as available to the progressive farmer as to the progressive business man of the city.

A letter received by the bureau of animal industry reports the following announcement published by a Wisconsin bank to its farmer patrons:

"Why not keep some of those pure bred Holsteins home? Many fine animals will be sold at the first annual sale of the Brown County Holstein Breeders' Association to be held in the Brown County Fair Grounds, West De Pere, Wisconsin, on Monday, May 10. The ——— Bank is ready to stand back of any of its customers who wish to purchase some of the stock to be offered for sale and who do not feel able at present to carry the investment. Call at the bank and the accommodation can be easily arranged."

The Supreme Evidence of DE LAVAL Cream Separator Superiority

Naturally the cream separator does not make or break the average farm user. The majority of them have no sure means of knowing just what their separator may be saving or wasting.

But the big user in the whole milk creamery or city milk and cream plant does know, and in the long run the separator means success or failure in his case.

That's the reason why 98% of the world's users of factory size cream separators use the De Laval, and why the few such machines of other makes occasionally sold soon find their way to the scrap heap.

And it may well be remembered that De Laval superiority means relatively just as much to the small as to the big user. Ten dollars a month mean as much to the farmer as ten dollars a day to the creameryman.

It's not only a matter of quantity and quality of cream, but of capacity, labor saving, dependability and durability over a long term of years.

A De Laval catalog helps to make these facts plain. The trial of a De Laval machine does so better still. Every local De Laval agent stands ready to prove them.

If you don't know the nearest De Laval agent simply address the nearest main office, as below.

ELLIOTT-BRANT RANCHO HAS CLASS LEADER

Elsie of the Rancho 89755, a Guernsey owned by Elliott-Brant Rancho, Owensmouth, has recently qualified for tenth place among the Class DD leaders, with a record of 8714.9 pounds milk and 548.31 pounds butter fat.

Elsie of the Rancho 89755 was bred by her present owner and was dropped in October, 1915. Her sire is Newgrove King of Briarbank 27362, Elliott-Brant Rancho's first herd sire. He is a son of King Bell 13482 and out of Imp. Newgrove Queen II 27175, one of the highest record daughters of Imp. Masher's Sequel 11462. Her dam is Elsie's Argie Granger 40056, with a record of 477.22 pounds of butter fat in Class D.

The new class leader freshened in November, 1918. In spite of the handicap of being milked with a machine

Elsie of the Rancho

Owned by Elliott-Brant Rancho. First prize three year old at state fair, member of first prize aged herd and first prize dairy herd.

in stanchions and being shipped on a show circuit during her test period, she produced more than 500 pounds of butter fat during her first year. At the end of this time she was still in good condition and was dry only seven weeks before she dropped the second calf. It was, therefore, decided to drop the first five months of her test period and extend the record as long as possible without disqualifying her from the double letter class. By this extension in her test period she lost 185 pounds of butter fat, but more than made this up in the three months and ten days of her extended record. Her largest butter fat production was during the month of March when she produced 67.48 pounds, and her largest milk flow was in February when she produced 1,157.0 pounds.

Elsie of the Rancho 89755 is a very beautiful cow. At the California state fair she was first prize three year old, a member of the first prize aged herd, and a member of the first prize dairy herd. She exhibits splendid Guernsey type which she inherited from her sire and in turn has transmitted to her two heifer calves.

SUCCULENCE FROM SORGHUM SILAGE

Sorghum silage, according to United States department of agriculture specialists, promises to become a champion yielder of winter succulence, not only for dairy cows but for other livestock which relish canned crops. Unfortunately, when sorghum was first used for silage purposes, many growers cut it too early, so that when the material was removed from the silo for feeding it was sour and acid and livestock rejected it. As a result sorghum gained an evil reputation although experiments have demonstrated that it is one of the most admirable crops for ensilage purposes that can be grown.

In five years' experiments at Hays, Kansas, the average acre yield of sweet sorghums was 10.34 tons, as compared with 8.06 tons of kafir and 3.8 tons of corn. In eastern Kansas, where the rainfall is 30 inches or more, on fertile soils sweet sorghums

have yielded 18.2 tons an acre, as compared with 1.88 tons of kafir and 11.81 tons of corn silage. Detailed feeding experiments have shown that sweet sorghum silage is proportionately equal to corn and kafir silage for either beef production or the maintenance of stock animals, although for dairy cows this variety of ensilage is less productive because of its low content of protein.

Sorghum silage should be cut when it is mature, its ripeness being denoted by the presence of hard seed. The test for ripeness is when the seed will crack when crunched between the teeth. When cut at this time it produces a fine quality silage which keeps well and is more keenly relished by cattle than corn silage. Experiments show that the average acidity of corn silage is 2.03 per cent, that of sweet sorghum silage is 1.46 per

cent, and that of kafir silage is 1.43 per cent.

WINSOR RANCH DUROC SALE

The Winsor Ranch sale of registered Duroc bred sows is to be the opening wedge in a series of bred sow offerings in the south end of the state. The Winsor Ranch offering will hold the boards at Los Angeles on July 28. Nothing is being left undone by the management to make this event exactly what it should be toward blazing the way for bigger things in the California Duroc world in the very near future. These sows are largely yearlings. From all standpoints they are a strictly select lot. They are of up to date blood lines, they are well developed, and they show the right type. Add to this the fact that the new owner is to get the whole life of usefulness of the sows bought in this sale and you have it all in a nutshell. They represent the get of such sires as Cherry's Friend, Pathfinder, Great Orion Sensation, Orion's Fancy King and Great Model. They will be bred to the two noted Winsor Ranch sires, Winsor's Giant Orion and Great Sensation 3d.

CRACK HAMPSHIRE OFFERING

California Hampshire enthusiasts are to have their inning on July 30 at Conejo Ranch, Newbury Park. The 40 or 50 bred sows selected for this public sale offering are of a character to boost the breed in every community to which they may go. To those in position to know best it is very evident that the Hampshire hog is here to stay. The breed has a splendid foothold in the south end of the state, and it is making advancement in all parts of the state. The Conejo Ranch sale catalogue will be ready for distribution by the middle of July. It will be remembered that the Conejo Ranch herd has been steadily at the forefront at every big

show the past few years. The leading families of the breed will be much in evidence on sale day.

TOUCHING THE HIGH SPOTS

An unhealthy cow will not yield wholesome milk.

Milk from a diseased cow contaminates all the milk with which it is mixed.

A cow with tuberculosis is a sick cow.

A cow with lice is not healthy.

A cow with loose bowels is unsanitary.

Isolate affected cows from the healthy herd if you would produce clean milk.

A filthy barn is a cause of filthy milk.

Bacteria in milk indicates the presence of dirt.

Advertising pays. Do it by operating a clean dairy.

A filthy barn attracts flies. Flies carry infectious diseases.

If you would have healthy and vigorous cattle, have the barn well lighted and ventilated.

Certified milk may be produced with a crude equipment if the bacterial count is low and the milk properly cooled.

You cannot strain sugar out of your coffee. Neither can you strain bacteria out of milk.

Milk permitted to dry on vessels is hard to remove.

Watering milk is an act of dishonesty.

Clean, wholesome milk will spoil on the consumers' hands if not properly kept.

It is no fault of the dairyman if milk is left deposited for any length of time on the front or back porch exposed to the sun, flies and bugs.

A friendly licking of the milk bottle by the dog or cat does not improve the quality of the milk. Remove it from the front or back stoop soon after the dairyman leaves it there. (S. O'T.).

TWO BILLIONS IN MILK

The importance of the dairy industry is indicated by the fact that during the calendar year 1919 approximately 90 billion pounds of milk were produced in the United States, enough to provide nearly 850 pounds for every man, woman and child or practically two and one-third pints per day. On the basis of the average 1919 prices this milk had a cash value to the producer of more than \$2,000,000,000.

Approximately half the milk produced is used in the production of various manufactured dairy products.

CONEJO DUROCS AT AUCTION

The Conejo Ranch, Newbury Park, will entertain breeders of Durocs at the big ranch headquarters on July 29. The public sale offering is to consist of a string of 40 or 50 bred sows noted alike for the excellence of their blood lines and the high character of their usefulness. The herd sires in use are Giant Wonder, Big Model and Pathfinder's Pride.

CALIFORNIA LAWS ON DAIRY

The state department of agriculture is issuing Circular No. 1: "Some Provisions of California Laws on Dairying." The dairyman who wants to be informed as to special provisions and requirements in dairy practice should write Department of Agriculture, Sacramento, and ask for this circular.

The Colorado River on June 8 reached the highest flood point ever known, the former highest mark being in 1917.

CLEAN UP THE STABLE FLY

Have you ever tried to sleep on a hot summer night when just one mosquito had crept through the window screen? Imagine your state of mind if that single mosquito were multiplied by 100 and you had your hands tied!

That sensation, according to the bureau of entomology, is something comparable with what a horse, mule, or cow endures when the stable fly is present in great numbers.

The stable fly greatly resembles the ordinary house fly but for the lance with which he is armed. It is known that he carries disease from infected animals to healthy ones, and there is some ground for belief that the insect aids the spread of spinal meningitis among human beings.

The eggs of the fly are laid in loose, warm straw heaps and piles of stable refuse. A plague of flies always starts from these sources, and the control of the pest is best managed by scattering the straw early in the spring before the beginning of warm weather and plowing it under, or by burning it when former method can not be applied.

Stable refuse should be scattered at regular intervals of one week or less throughout the season, starting with early spring. In this way the first generation of the pest is destroyed and a plague averted. A recent publication of the department, *Farmers' Bulletin 1097*, gives in detail the life history of the stable fly, methods of its control, and some facts concerning the amount of damage done by the insects. This may be secured on request to Superintendent of Publications, Washington, D. C.

HAND JERSEYS DISPERSED IN OREGON

Dr. H. W. Hand of Orland dispersed his well known herd of Jerseys at a sale held recently at Salem, Oregon. Dr. Hand was influenced to sell in that state on account of the strong place occupied by Jerseys in the Northwest. Included in the sale were a number of well known prize winners and the one time world record cow, Goldie's Nehalem Beauty. The following list details the sale:

BULLS

Blossom's Liberty Bond, July 3, 1917; R. L. Rice, Sheridan, Oregon; \$175.
Blossom's Fox Keep On, October 30, 1919; H. A. Beer, Arcata, California; \$360.
Lolita's Liberty Bond, November 9, 1919; J. R. Hayden, Mohawk, Oregon; \$100.
Agnes' Golden Boy, December 25, 1919; M. Weinacht, Woodburn, Oregon; \$60.

FEMALES

Goldie's Nehalem Beauty, May 8, 1912; Watt & Acree, Hood River, Oregon; \$960.
Imp. Brilliant Spray, September 12, 1909; Shortley Bros., Orcas, Washington; \$230.
Brilliant Jersey Queen, March 18, 1916; Watt & Acree; \$1,000.
Brilliant Spray's Gloriana, November 25, 1918; Fox Bros., Silverton, Oregon; \$425.

CHEAP FEED AND CULLING ARE NEEDED FOR HEIFERS

The importance of providing cheap feed for growing heifers and practicing thorough culling is brought out by the results of feeding experiments recently completed by the dairy division, United States department of agriculture. In these experiments groups of calves were fed from birth to one year and two years of age and a record was kept of all feed consumed.

In one experiment, 11 heifer calves were raised to the age of one year. The average amount of feed consumed by each calf was as follows: Hay, 571.8 pounds; grain, 885.5 pounds; silage, 3,693.1 pounds; milk, 110 pounds; skim milk, 2,414 pounds. Estimating the hay at \$30 per ton, grain at \$6, and silage at \$8 a ton, milk at four cents, and skim milk at three-

fourths cent per pound, the cost of raising each heifer to one year of age was \$72.42.

Five of the calves from the first experiment were then fed for one more year. During this second year each calf consumed on the average, 1,117.8 pounds of hay; 1,221.6 pounds of grain; 8,031 pounds of silage. Using the same figures for computing the cost of the feeds consumed during this second year, the total cost of raising a heifer from birth until two years of age was \$157.96. These figures emphasize the necessity of providing for heifers cheap feed such as pasture and silage, and bring out the importance of carefully culling the heifers to avoid raising those which will prove to be inferior cows.

COW TESTING WORTH WHILE

Practical reports from the various cow testing associations throughout the country show the value of this work of separating the chaff from the wheat in cowdom. The modern cow testing association is the best scientific agency for isolating and eradicating the drones from the herd, while it also is of value as a detector of the highest producing animals. Such studies of the cow's appetite, digestion, and production are the economical and logical methods of increasing the net earnings of the dairy.

One Ohio cow testing association, whose members owned 385 cows last year, reports an association average of 345 pounds of butter fat per cow, and that the present production of the cows is 72 pounds of fat more apiece than it was at the first of the year.

Another cow testing association announces that its expenses during the last five years have been below \$4,000 while the value of the increased production during only the last year has aggregated over \$11,000. This remarkable increase in income is not abnormal for this particular association as during each year the production of the cows has improved and the returns greatly increased. Members from another association report that all other cow owners are feeding the individual animals according to the capacity and production of each cow. This is a remarkable change from conditions a few years back when the cows' feed boxes at mealtime always contained the same allowance of feed.

"There is certainly all the difference in the world between bulls," comments a member of a successful bull club. "Do you recollect that old 'Bonnie' cow of mine whose record was only 537 pounds of fat? I have raised three heifers from her, the best of which produced 715 pounds of fat during the last year, while the other two heifers, which are younger, yielded respectively 363 and 361 pounds of fat. These heifers were sired by different pure bred bulls and evidently the difference in the qualifications of the sires as regards fat production is aptly characterized in the production of their daughters."

HORSE AND MULE POPULATION INCREASING

Despite the claims of truck and tractor manufacturers that horses and mules are destined to disappear they are bringing on the market today the highest prices ever paid and the demand is greater.

As proof of this the estimate of the federal department of agriculture for January 1, 1920, shows an increase of 1,276,000 horses and 785,000 mules over the 1910 census. Besides from January 1, 1910 to June 30, 1919, 1,149,763 horses and 36,836 mules were exported, and the end is not in sight. For predictions by good authorities are for a steady rise in prices. Therefore, breed your good mares to a first class stallion this year.

CLEAN UTENSILS, CLEAN COWS, CLEAN BARNS GIVE CLEAN MILK

Children love milk; so do bacteria. Children grow and thrive on milk; so do bacteria.

The problem of the man who produces milk is to keep it intact for its ultimate and lawful consumer. The bacteria which are most fond of milk are those which law and order are in arms against—tuberculosis, diphtheria, typhoid and scarlet fever.

"Milk, to be free from germs, must be kept in germ free containers," says C. Seymour of Colorado agricultural

college. "Secondly, it must carry no dirt with it from the exterior of the cow, and, thirdly, no dust must fall into the milk after it is drawn."

The department of agriculture recently carried out an experiment on the bacterial content of milk. The milking was done under ordinary unsanitary conditions. These astonishing figures resulted: The cans used were small topped. Sterilizing these cans reduced the bacteria per cubic centimeter from 60,000 to 17,000. Simply wiping the udder and flanks of the cow resulted in the further reduction of the bugs to 3,000.

It was also discovered that by cleaning the stable daily and using plenty of litter for bedding that a minimum of time was necessary to groom the cows.

Milk is the only standard animal food which is consumed raw, and it forms one-sixteenth of the daily diet of every person in the country. Milk is a perfect medium for the growth and multiplication of bacteria.

It is therefore seen that the utmost cleanliness must be exercised in the production of commercial milk.

Clean utensils, clean cows and clean barns will give clean milk.

THE SCREW WORM FLY

Some time ago warning was issued by the division of animal industry of the state department of agriculture regarding the ravages of the black blow fly. Numbers of animals, particularly sheep, have been observed that were badly infested with the maggots of the black blow fly. In many instances if proper precautions had been taken this would not have happened.

We are soon to be confronted with the task of suppressing the activities of another species of insect pest that is more destructive to livestock than the black blow fly; viz., the screw worm fly. This fly is commonly known to stockmen as the "redhead." It is of medium size, has a bluish green body, and on the back between the wings three longitudinal black lines are visible, while the head appears either reddish or yellowish in color.

The resistance of the screw worm fly to low temperature is not great and for that reason it will not make its appearance in great numbers until the weather continues warm. Its field of activities is broad and of a very serious nature. From the human family down to the smallest rodent it carries on its depredations, producing immense damage. When man is attacked the insect usually deposits its eggs in the nose at a time when the individual is afflicted with diseased membranes. Here the eggs hatch in from one to three days, depending on the temperature, and the maggots immediately begin to burrow into the tissues of the nose and throat, producing untold suffering. Fresh wounds on animals are most frequently attacked by this insect, but it does not entirely disregard old sores. A single screw worm maggot is extremely destructive to tissues over a large area.

Carcasses, particularly those not exposed to the rays of the sun, are the favorite breeding places for blow flies. Bury or burn all carcasses and screw worm flies will not be numerous.

The maggots in a wound may be destroyed by introducing into it a small quantity of chloroform or a dilute solution of carbolic acid or coal tar products.

Why the Egg Laying Contest?

By Max Kortum

HIGH producing stock is the one foundation for the future welfare of the poultry industry. The mediocre stock of today will soon be a thing of the past, for with the ever increasing price of feed and operation culling of such stock has become an absolute necessity, and we hear or read of it daily in the terms of "Failure in the Poultry Business." The poultryman can be thankful that nature stands at hand to help him out of this dilemma if he will but use her. The law of heredity—that like tends to produce like—is the keystone on which rests final success in the culture of all plant and animal life by mankind. It has been resorted to many years, and nearly all agriculture today thrives on the result of the work that has been done, but from the progress made from year to year it seems that the goal is still far ahead. Selecting and mating the right parents is the secret of this work; the law of nature will do the rest. It sounds simple and is simple to the careful observer and breeder, but the average layman is apt to misinterpret and take this law too much at its face value. It works both ways, and by mating two parents the breeder must always

test that his hens do possess unusually good egg producing qualities, then the public will have a sound basis for their belief, and the breeder on the other hand will be receiving greater and wider advertising than he ever could afford himself. The reports from the egg laying contest are published in all the leading agricultural journals of the state and nation and all extraordinary high records quickly become known the world over. Just think for a moment what this means. It means that for the small cost of entering his birds in an egg laying contest the breeder obtains nation wide publicity if his birds make good. A breeder does not necessarily have to win in a contest to show that his stock is good; this is often a matter of luck for the man who is fortunate enough to pick out just the right birds. And again slight ailments at times may prevent a good hen from doing her best, and this will give the owner a setback in the total production of his pen; but in case of such misfortune he always has the chance of making individual records.

The egg laying contest, however, has another great value besides that of showing the public the quality of a breeder's stock, and that is to help

POULTRYMAN'S CALENDAR—JULY, CULLING THE LAYERS

June, July and August are the best months for culling. By the first of July some of the slackers are beginning to molt. Remove them at once and for good.

The heavy producer is by this time faded in shanks, beak, vent and earlobes, but her comb is still red, her abdomen full, soft and warm. She should continue to lay till September.

All hens with wilted combs, all hens with bright yellow shanks, all hens that stop laying, except for their first broody spell, should be thrown out in July. They are not profitable.

The molting test is the surest of all tests for fecundity. The early molter is invariably the low producer. The late molter is the heavy layer. Have no scruples about getting rid of the hens that molt in July.

bear in mind that he is also apt to be intensifying any bad characteristics as well as the good ones, especially if both parents possess the same weakening or undesirable tendencies. These latter characteristics are frequently latent and only a carefully kept past record of the individual will prove this.

Much work has been done with poultry along these lines with some wonderful results. It was not many years ago that the 200 egg hen was the goal for which breeders were working; then it was the 250 egg hen; and still later the 300 egg hen which some breeders believed never would be gotten. And now we read of a 330 hen. What next? Will it be possible for a hen to lay every day in a year? Who knows! The time will come, and it will not be so many years, when the better commercial flocks will average 200 eggs per hen. The average for this country today is somewhere around 87. Under the pre-war conditions this average could possibly have just existed, but it cannot today. At the present time a hen has to lay almost ten dozen eggs to cover all expenses; this means that a flock has to average around 150 to make the business worth while at all.

Hence the mainstay of the poultry industry today is better stock, and the best stock we have is that selected with the help of the trapnest. It will not be many years when the greater portion of the stock offered on the market will have to carry some sort of reliable pedigree so that the buyer can feel assured that he is getting something which under the proper care will net him a profit. This means that the poultry of tomorrow is today in the hands of the breeder who is trapnesting and doing careful breeding. This man stands at the head of the row, and the egg laying contest is the gateway to his field of business by way of an honest and inexpensive road to publicity.

The general public will not as a rule place too much faith in the words of a breeder himself as regards the quality of his stock, for it has been fooled too often on that 200 egg stock story. But when that same breeder who advertises such high producing stock can demonstrate in an egg laying con-

test that his hens do possess unusually good egg producing qualities, then the public will have a sound basis for their belief, and the breeder on the other hand will be receiving greater and wider advertising than he ever could afford himself. The reports from the egg laying contest are published in all the leading agricultural journals of the state and nation and all extraordinary high records quickly become known the world over. Just think for a moment what this means. It means that for the small cost of entering his birds in an egg laying contest the breeder obtains nation wide publicity if his birds make good. A breeder does not necessarily have to win in a contest to show that his stock is good; this is often a matter of luck for the man who is fortunate enough to pick out just the right birds. And again slight ailments at times may prevent a good hen from doing her best, and this will give the owner a setback in the total production of his pen; but in case of such misfortune he always has the chance of making individual records.

And now we come to what an egg laying contest must be. It cannot be a Tom, Dick and Harry affair, for then we have the same questionable basis as a government experiment project and have an entirely unprejudiced and honest management, backed by the best authorities. The reports go out to the poultry world and must be accepted as authentic. The hens should be given such care in housing and feeding as will give them every possible chance to produce their maximum yield, but no highly expensive methods of feeding or care should be employed. The contest should be run on the same basis as a well conducted commercial plant, and in this way it becomes a model and stands as an example to all other poultry yards.

California has today such a contest, and it behooves every good breeder and poultryman to try to get his stock represented in it. The California Farm Bureau Egg Laying Contest located at Santa Cruz, although

FOR GREATER EGG PRODUCTION

Coulson & Co.
PETALUMA, CAL.

in operation but seven months, has already attracted the attention of poultrymen from all over the nation. The records so far established are running in close competition to those being made at other contests in spite of the fact that the average quality of the stock in the contest is not as high as that supposed to be in those contests that have been in operation for years, for, as mentioned before, many of the birds are just picked out of commercial flocks, regardless of any special breeding. Those pens at the eastern contests that are leading the California contest a little are all of the heavier breeds, whereas all the birds in the California Farm Bureau Egg Laying Contest, except for one pen of Anconas, are White Leghorns. The California Farm Bureau Egg Laying Contest is in charge of a board of directors appointed by the Santa Cruz farm bureau, with the poultry division of the university farm at Davis aiding in an advisory capacity. Although the poultrymen of Santa Cruz built and boosted the contest they have nothing to do with its management so far as the care of the hens is concerned. The committee in charge is now considering plans for a contest plant that will accommodate 100 entries, which will mean 1,200 birds. The next contest year will start on the first of next October; entries will be open to all pure bred varieties of chickens from anywhere.

Poultrymen of California, make your slogan "Better Poultry." The time has come when you have to do it.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

By Max Kortum

The 340 contesting hens at the contest laid during the past week 1,347 eggs, a decrease of just 50 eggs from the previous week's production. Percentage of production was 56½ for the week. The seventh month of the contest ended on the night of June 15. A report for this period will be published next week.

High pens for the past week are: Gibson, 51 eggs; Rose, 50; Bellows, 50; Gray, 49; Clark, 49; Wood, 48; Gibson, 48; Barker, 47; Peck, 46; Walls, 45; Wilson, 45; Stephenson, 45.

AMERICAN EGG LAYING CONTEST

By Russell F. Palmer

In spite of the extremely damp and cloudy weather during May the pullets in the American egg laying contest on our experimental farm at Leavenworth, Kansas, made more than satisfactory records. After a careful examination of individual records of each pullet in the contest Prof. Quisenberry, the director in chief, reports the majority of the fowls in a highly pleasing condition; in fact, a condition that should carry a large per cent of them through the hot Kansas summer weather with good producing records. Naturally, the records of many of the larger breeds were somewhat affected last month on account of broodiness, but on the whole this has not proven so hard to deal with this spring as last. An error in addition of totals was made in last month's report, which placed the wrong pen in the lead up to May 1. This has since been found and corrected in auditing.

The following lists give complete condensed figures both for the month of May and since the beginning of the contest. A total of 30,513 eggs have been produced since November 1. This is an average of 113 each for all 270 pullets over a seven months period.

Highest Pens for Seven Months

S. C. White Leghorn, Pennsylvania, 771 eggs; Rhode Island White, Kentucky, 731; S. C. White Leghorn, Iowa, 707; White Wyandotte, Pennsylvania, 695; S. C. White Leghorn, Texas, 693; S. C. White Leghorn, Washington, 674; S. C. White Leghorn, Missouri, 661; S. C. White Leghorn, England, 660; White Orpington, Ohio, 657; S. C. Rhode Island Red, Nebraska, 641; S. C. Rhode Island Red, New York, 641.

Highest Pens for May

S. C. White Leghorn, Kansas, 128 eggs; S. C. White Leghorn, Kansas, 125; S. C. White Leghorn, Texas, 124; S. C. White Leghorn, Michigan, 123; Rhode Island White, Kentucky, 120; S. C. White Leghorn, Ohio, 120; S. C. White Leghorn, Illinois, 119; S. C. White Leghorn, Pennsylvania, 118; S. C. White Leghorn, New York, 118; S. C. White Leghorn, Pennsylvania, 117.

HULLED BARLEY

The latest economy in poultry feed is the hulling of barley. Many growers have felt they secured more satisfactory results in using as a poultry feed by soaking or even sprouting the barley. This was satisfactory to the hens, but rather bulky, and gives an amount of "roughage" which is not acceptable to the poultry constitution, that is, where highest production is secured. This has been overcome to an extent by hulling the barley, with, however, considerable loss in weight and bulk and slight loss in feeding value as it has seemed necessary in removing the hull to take off a portion of the outer coating, or bran, of the barley in order to secure the hull. Now, however, the Poultrymen's Co-operative Milling Association has corrected this by the installation of a machine especially adapted to the work, taking off only the outer or coarse hull. This does cause about two per cent loss in the total protein content of the feed and a weight shrinkage of from 13 to 18 per cent, but the greater value of the remainder is sufficient to justify the loss and the expense of the hulling.

Ventura farmers under the distribution system of the Southern California Edison Company have filed complaint with the railroad commission charging the company with failure to provide them sufficient water to irrigate their land.

Poultry Queries

Conducted by J. A. Koethen

Partridge Rocks

Kindly let me know the name of a breeder of Partridge Plymouth Rocks who has cockerels for sale at a reasonable price.—H. T. R., San Fernando.

Neither the Cultivator's advertising columns nor the list of entries at the last show discloses the name of a Partridge Rock breeder. If any of our readers have birds of this beautiful breed, now is a good time to let it be known.

Sick Goslings

My two months old goslings are sick. Their wings droop, they can hardly walk, and their legs seem to be swelling. They range all over the ranch and have a good ditch of water to wade in. What shall I do for them?—Subscriber, Isabella.

I fear your goslings have developed rheumatism from wading in that ditch. You do not say how cold the water is nor how long the goslings have been wading, but young waterfowl need to be protected from getting wet till their feathers are grown, and running

water is colder than a puddle would be. Confine them in a sunny, sheltered yard, but not without shade, give all the green feed they will eat and twice a day a mash of bran and middlings or bran and corn meal moistened with water till it is crumbly but not sloppy. You might also put a quarter of a teaspoon of Epsom salts for each bird in the drinking water, but your main dependence must be on a warm, dry environment. If their legs swell badly paint the swelling with iodine.

Turkey Troubles

Last week I saw the wings of some of my little turkeys drooping, and when I examined them I found mites on top of the wings in the grooves where the feathers come out. I greased them first with lard and sulphur and afterward with lard and coal oil, but they seem no better. Now one of the older ones that is shooting the red is dumpish and does not care to eat. What shall I do?—Subscriber, Garden Grove.

If you saw any sort of insect crawling on the wings of your turkeys that is enough to make them sick. Lice are something young turkeys cannot stand. Grease is not as good as dust. (Continued on Page 27.)

Easy going on a track, the CLETRAC way.

Cletrac
TANK-TYPE
TRACTOR

RAPID DISCING

Speed up your discing work by putting a CLETRAC on the job. This sturdy little tractor, powerful, rapid and tireless, will replace six to eight horses, work twenty-four hours a day if necessary and seven days a week. Used alone or in "fleets," the CLETRAC is the ideal tractor for every size ranch—for every type of work.

The CLETRAC travels lightly over the surface of the ground with a firm, sure tread, without sinking in or packing the soil. It gets the corners also because it can turn short. In the orchard, too, the CLETRAC is at home. Low hung, with no projections, it weaves in and out among the trees without injuring them. Let the CLETRAC shoulder your problems. Write today for that interesting booklet, "Selecting Your Tractor"—it's free.

For Sale—Calif-way milking machine, De Laval separator, James Mills Orchards Corporation, Hamilton City, California.

POULTRY QUERIES

(Continued from Page 25.)

ing for ridding turkeys of vermin, and coal oil is far too severe. Buhach powder is best. Dust them well over and under the wings, over the head and around the vent once a week, and do not forget to dust the mother, for they get the lice from her. The older turkey probably has blackhead, the result of overfeeding at some period of his life. You might try giving him a liver pill at night for a few nights, but he will probably die. The main thing is to keep the others from following his example. If they are on green alfalfa they need very little beside; in fact, they will probably do just as well on alfalfa alone for a few days. At the most a little wheat at night is all they need beside. If you can give them cottage cheese or clabbered milk that will help them to resist the blackhead germs. Feed two quarts a day of the milk for the 42 poulters or as much cottage cheese as they will eat up in ten minutes.

Wry Neck

Two of my hens died today. From the description of "wry neck" in your book I think that was the trouble. Their combs were bright red and their eyes bright, and they seemed healthy till suddenly we saw them twist their necks and act as if they were in a fit. The first sign of illness was a drooping of the tail. Then they went to the nest and stayed there. Could they have been poisoned?—Subscriber, Puente.

Wry neck is the result usually of severe indigestion following the taking of something unfit for food into the digestive tract. It may be a kind of ptomaine poisoning from eating spoiled meat or moldy grain, or from the presence of intestinal worms. Clearing out the intestinal tract with castor oil or a good dose of Epsom salts may give relief but after the twisting is noticed it is usually too late for treatment.

Ruptured Oviduct

Ever since my Rhode Island Red hens, now 14 months old, began to lay there have been cases among them of bloody eggs and ruptured vent. The hen when she came from the nest would be picked to death unless some one happened to be present and removed her, in which event the rupture healed. In two cases, however, the egg passage healed shut, preventing the passage of eggs, and I lost the hens. They have been fed milo and wheat, one quart for each 30 hens, fed twice daily, and a commercial egg mash, with plenty of green, charcoal, etc., and have had range for two months past. Can you make any suggestions as to cause and prevention? I hate to think of disposing of all my older stock. I enjoy the Cultivator very much and have received much valuable information through its columns.—Subscriber, San Diego.

What, you call "ruptured vent" seems from your description to be

rupture of the oviduct, coupled in some cases at least with eversion or prolapse of the oviduct. The immediate cause is usually straining to lay an egg that is too large for the oviduct, though constipation sometimes has the same effect. But back of either of these immediate causes is a congenital weakness of the membranes and ligaments of the oviduct which makes them unequal to the strain of egg production. There are three things you may do: First, lighten up the ration so that the hens will not lay such large eggs. If you are feeding a commercial mash, mix it with bran, half and half. This makes the proportion of meat just half what it was before and does away with the danger of forcing. Feed all the greens the hens can be coaxed to consume, and if they have good range diminish the amount of scratch grain somewhat. Milo probably has nothing to do with the size of the eggs, but it is not considered the best feed for summer in this part of the state. Wheat and barley, half and half, is more satisfactory. Second, make sure that none of these hens are suffering from constipation. This can be done by mixing half a teaspoon of Epsom salts for each hen in moist mash once a week. Give just what the hens will clean up quickly. Third, see to it that no hen that has ever shown symptoms of this trouble is used in the breeding pen. It is not necessary to dispose of all or any of your stock, though it might be as well to market those that have been ruptured more than once or that have not thoroughly healed. Just band all affected hens with a colored band which will indicate that they are not fit for breeders. Such weakness can be eliminated only by proper selection.

ALL NORTHWEST EGG LAYING CONTEST

By R. V. Mitchell, Director

Breed honor roll of the fourth year's contest conducted by state college of Washington at Pullman, November 5, 1919, to May 31, 1920:

Miscellaneous

High pens: Anconas, F. E. Pullen, Whonnock, B. C., 473 eggs; Blue Andalusians, H. S. Cadwell, Spokane, Washington, 276; Buff Minorca, Lester Boyd, Pendleton, Oregon, 267.

High hens: Ancona, F. E. Pullen, Whonnock, B. C., 121 eggs; Ancona, F. E. Pullen, Whonnock, B. C., 105; Buff Minorca, Lester Boyd, Pendleton, Oregon, 95.

EGG DAY AUGUST 21

The third annual celebration of egg day will be held August 21. The Petaluma chamber of commerce is forwarding the movement and invites poultry people, hotels, restaurants and everybody to use more eggs beginning with Egg Day, not only for their food value but in support of the industry at large.

GRADED EGGS BRING HIGH PRICES

Can it be that Canadian citizens are profiting more by the advice of the United States bureau of markets regarding the marketing of eggs than our own people for whose benefit that advice is intended?

Because of the superiority of Canadian eggs, due to grading, packing and shipping methods similar to those advocated by the bureau of markets, Canadian eggs sell for 3 to 17 cents higher in British markets than American eggs.

Canadian eggs are carefully graded as to quality, size and color; packed in clean cases with clean fillers of proper weight, and provided with adequate refrigeration.

The wide difference between the selling prices of American and Canadian eggs should not exist. Canadian hens do not produce better eggs than

American hens, and that being so, all that is necessary for American shippers to secure high prices is the use of greater care in preparing eggs for foreign markets. The same principles apply to eggs marketed at home.

REDUCE EXPRESS ON MEAT RABBITS

The National Fancy Rabbit Club has secured the cooperation of the American Railway Express Company in petitioning the interstate commerce commission for a reduction of the express rate on live rabbits. The Rabbit Club says that prohibitive express rates has been the one big obstacle toward broadening the market for meat rabbits in large cities, as wholesale meat dealers, butchers, and commission merchants must of necessity obtain their supplies of fresh rabbit meat from zones near the large centers of population. Under the proposed change of tariff on meat rabbits, the rabbit will be carried at exactly the same rate as live poultry intended for food purposes. Not only that, the added value of the rabbit as a fur animal becomes a very important item in its use for food—the pelt can be turned into account when the rabbit is butchered, and its sale should defray a great part of the transportation expense.

FORTY-FIFTH ANNUAL A. P. A.

The American Poultry Association holds its forty-fifth annual convention at Kansas City, August 10-14. The publicity committee writes that a program of greatest interest to all poultry fanciers and producers has been arranged. We put emphasis on "producers" for we notice in scanning the program that one item alone indicates the producer is to receive more attention than formerly. This item is: "How to Build Up a High Laying Strain of Standard Bred Poultry," by Prof. James Dryden, is only one of several practical features."

Hens Like Hulled Barley

In these times of high wheat prices, experienced poultrymen are feeding hens hulled barley, instead of wheat.

The lower priced barley contains nearly as much food value for hens as is furnished by wheat—more, in fact, in proportion to the cost.

The barley hulls, however, must be removed without grinding away the rich layers of protein on the outside of the barley kernels. The Poultrymen's Co-operative Association has installed the latest type of barley huller—the largest of its kind in Los Angeles. With this machine, poultrymen are provided with Hulled Barley in which all the elements are fully preserved and hence possesses great value as poultry feed.

California Poultrymen With Egg-Producing Records Are Using P. C. A. Hulled Barley

Write your name and address across this advertisement, mail the entire clipping to us and we will send you valuable information on feeding Hulled Barley.

A WISH

Oh, for a garden all mine own
Of berry, grape and corn,
And flowers of old-fashioned kind
The table to adorn.

A bird's nest in the border grass,
And robins in the tree,
And all above forever mine,
As far as eye can see;

Where gipsy stars prognosticate
Good things for me in store,
And read into this hand of mine
God's love for evermore.

Oh, for a garden all mine own,
Filled with sweet growing things,
With birds a nest, and one sweet home,
Where love forever sings.

SIR STUPE ID AND MENO FALLS

By Clara Peterson

"DEAR me!" exclaimed Dorance one bright morning when her Stupe was bending over his rosewood desk instead of taking her riding in their new lavender coach. "Dear me! I believe I'd rather have you fat and lazy than attending to everybody's business."

She looked so very pretty pouting that Stupe got up and went over to the window and kissed her. During the year they had been married he had grown slimmer and browner until he was now as handsome as anyone in the world could desire, so Dorance thought. Dorance herself had gained a pound or two. Her eyes were as brown as acorns and her arms shone roundly through her thin white dress.

"It's this way," said Stupe, going reluctantly back to his desk. "Here is this long, complaining letter from the Mayor of Meno Falls. It almost sounds as though he blamed me for his troubles."

"O, I read it when you asked me to," sniffed Dorance. "I think it is a shame that outsiders try to drag you away."

You see, Stupe Id was supposed to govern only the city of Idron, and govern it he did, wisely and well. There was a time—but that was another story.

The two golden heads bent over the letter. Stupe commenced to read at the third paragraph.

"So we have determined to ask your advice. Once this city held its place in the world. Travelers hurried from Idron to us and were glad to come. ("He doesn't care what he says, does he?" smiled Dorance.) Now our streets are almost deserted. The city has not changed at all, yet tourists hurry through to Idron. You can spare us some of them. Will you consent to come at our expense and tell us what to do?"

"I have ridden through there," said Stupe, looking up, "and it was as decent as any city then. I don't know how they expect me to help, but the only thing I can do is go and see."

"I suppose you must," sighed Dorance. "But be back by tomorrow night. Mistress Thornberry is giving a party and your new blue velvet suit is a dream."

Stupe smiled foolishly. It always made him blush to have Dorance talk like that.

So Stupe rode away out of the city on his sleek grey horse, and Dorance sat under the birch trees and made him the dearest shirt of pink striped silk. (Stupe turned pinker than the stripes when he saw it.)

It was a good many miles to Meno Falls and Stupe had not taken the journey often. Once he had been too fat and lazy. After Dorance remedied that he had been too terrifically busy cleaning up his city.

Stupe could tell the minute his own people's land ended. The Idron grass was greener, the Idron road was less dusty, the Idron trees bore more perfect fruit, or so it seemed, than the grass and the road and the trees when Idron was left behind.

After traveling over a flat and beautiful country Stupe came in sight of Meno Falls. It was most attractive from a distance, peeping through the trees. Stupe began to look carefully to either side for, to tell the truth, he had not the slightest idea what he was to say to the Mayor, and he hoped to have an inspiration very soon.

In a short time he came to the first sign of life, a summer hotel set in front of a beautiful grove. There were only a few people about and Stupe drew rein and studied the place.

"It isn't bad," he thought. "I myself stopped there once and at that time it seemed like a palace, but it hasn't changed a bit."

"That's it!" he cried suddenly. "The mayor says the town hasn't changed. While other cities have been progressing Meno Falls has remained the same."

In fact, the hotel, which bore a dilapidated sign reading "Hamden Hostelry," was not now as inviting as the very cheapest lodging house in Idron. On the front veranda were seven great cases of bottles which, from their dustiness, might have been the same ones Stupe had seen there years before. There were dozens of flourishing flower beds, but each was enclosed by a tightly woven fence four feet high.

"Much good it does them to have flowers," thought Stupe. "I'm surprised that someone doesn't take a stepladder and try to get a glimpse of those blossoms."

He took out his leather note book and wrote, "Bottles down; fences down."

Soon his horse was trotting briskly into the city. Stupe began with the first street and rode to its end. Up and down he went, through every lane and highway in Meno Falls. The town was indeed asleep and dreaming. On the main street, which bore the title, "Barbarossa Boulevard," a few lazy loungers stared at the big, handsome fellow in surprise, but as he did not wear a purple robe nor even carry a scepter, not one of those democratic citizens realized that this was indeed His Highness, Sir Stan Id of Idron.

After he had been through the entire place, Stupe reined in his horse on the long stone bridge which looked out over the falls.

"Meno Falls," he said, doffing his plumed hat. "Here's to you, the only moving thing in your city!"

There happened to be an old chair lying aimlessly on the bridge, and as no one was watching, Sir Stan felt as much at home as in his own back yard. He led his horse to a patch of clover, sat down in the chair and, leaning on the railing, looked down into the water.

The bridge was part of Barbarossa Boulevard. To the north the street was lined with sleepy pharmacies and shops, to the south more shops, curtains drawn, some with windows broken.

"Here we are!" said Stupe. "Now what's to be done?"

The water was rushing over the dam with a great splash and commotion and the cool spray felt delightful to Stupe in his sunny seat. The water churned down into a natural basin at the foot of the falls and then divided widely, half to the right, half to the left, leaving a high and dry little island.

"That is the first thing," said Stupe, feeling very proud of himself, for he was young. "Here in the heart of the city I find this island covered with rubbish. It is almost under the main street bridge. It is large enough to be the beauty spot for miles around, the falls behind it, the hurrying water on either side; yet its trees are choked in weeds and the weeds are filled with trash."

He crossed the bridge and followed with his eyes the course of the river. The banks sloped delicately to the water, but instead of tender grass and bushes, clay and sticks ornamented the slopes.

Sir Stupe shook his head. "I'll see the schoolboys about that. It won't take more than a week."

He took out the note book and began his fault finding entries, resting the pages on the smooth rail.

"Every vacant lot seems to hold an old shack or a heap of rubbish. People pay no attention at all to their land which edges the roads. If they cut the grass surrounding the houses they are satisfied. I find several streets which have homes well cared for, but they are as damp and dark as a cave. There is such a thing as too many trees, the branches huddle together as though hiding something. It may be a crime to cut a tree, but half of them shall go—rather a crime than a cemetery. Then again, there are streets which do not know the meaning of shade. His honor the mayor must purchase a carload of saplings. Every vacant lot shall be at-

Threshing Time The Auto-Wheel Coaster

YOU'LL BE "actin' pretty" threshing time if you have

Auto-Wheel Coaster

—because you can do a bondred' little jobs in much less time. Some things you can do quicker are:

Hauling Water. The roller-bearings in the Auto-Wheel make easy—and a lot quicker, too.

Maybe They've Forgotten some tools they need in the field. The Auto-Wheel will haul them and you'll not notice the effort.

And Your Milking. Can you imagine an easier way to carry five or ten gallons at a time than on the Auto-Wheel?

Each Auto-Wheel is built to last. You can bounce over bumps, ditches and ruts, and it will still deliver the goods.

PRIZES FOR LIVE FELLOWS You have a chance to win attractive prizes. The "Auto-Wheel Spokemen" tell about prize contests. Send names of three coaster dealers, telling which handle the coaster with name "Auto-Wheel" on the sides, and we'll put your name on the mailing list.

HAROLD SOMERS, 160 De Kalb Ave., Brooklyn, N. Y.

When writing advertisers, mention the Cultivator

tended to by the city; every shack torn down. The merchants must at least keep their display windows filled and attractive; with windows filled the stores will fill too. I shall send one of my advertising men to attend to that. Houses which need paint shall be painted at once. If the owner has not the money he may return it to the city in installments. Each yard and terrace shall be mowed as often as needed. (There must be a number of lazy children here.) We will have some city mowers for them to horrow so there will be no excuse." (Stupe had already made up his mind to put his fee into these city items.)

"And the churches," thought Stupe, resting his silver pencil. "One of them has a sandy, patchy yard. There is no reason why the members should not sod it and plant trees and flowering shrubs. And that other cottage church—I must tell Dorance about that. It is so tiny that it shall be painted at once. I'll donate a stained glass in place of the cracked one, and those empty boxes at the windows shall be filled with Dorance's special roses."

Stupe had become so sure of the change in the city that when someone tapped him on the shoulder and he lifted his head, it was a great shock to see the weedy island and the hopeless streets.

The tapper was the Mayor of Meno Falls. Stupe had once seen him at the city hall in Idron. The mayor was red and puffing.

"Your Highness," he said, "I had not expected you so soon. The town is not always like this. But come—a glass of icy punch after this sun. Did you—have you—any ideas?"

Stupe got to his feet.

"A sleepy day, Your Honor," he replied cordially. "I feel as though I had been dreaming. Yes, a glass of punch, and then—"

* * *

It was a month before Dorance and Stan could get away from Idron long enough to carry over the blossoms for the cottage church. Stupe cast a sly glance at the summer hotel as they entered the city. The dusty cases were gone and so were the fences. In fact, there seemed to be a party in progress for the gleaming flower beds were almost surrounded by silken ladies, strolling happily. Most of them stopped and gazed after Dorance and Stan on their scarlet caparisoned horses.

"I thought I saw Mistress Turnabout in that crowd," said Dorance. "Do you suppose she has left us for Meno Falls? Why, this town isn't half as bad as you said!"

"Perhaps they have had time to do some of the things I suggested," answered Stupe, not very modestly.

"Oh, how pretty!" cried Dorance. "It's almost as nice as Idron. And paint—I haven't smelled so much paint since you started to clean up!"

In fact, Stupe was rather stupefied as he looked around. As far as they could see the grass was cut and people were digging dandelions or planting shrubs. Most of the men seemed to be engaged in painting. The vacant lots were now like short grassed meadows, and in them children were playing gleefully.

"Is it only 30 days?" thought Stupe. They had ridden into sight of the falls and Dorance was exclaiming:

"Oh, Stan, isn't the water beautiful! I haven't been here since I was a tiny girl. I had forgotten all about that dear little island. Isn't this a charming city? We must be more neighborly."

Stupe rubbed his hand over his eyes and looked down at the dear little island as well as he could for keeping his horse and Dorance's out of the way of the crowds in the street.

"Those schoolboys are a quick bunch," he said, for the island was trimmed and garnished. All the wild shrubs were there, the water still rushed along on either side; but the weeds were gone. Here and there were expanses of grass that looked as soft as velvet, and nestling in corners were beds of wild flowers. Pink and purple honeysuckles nodded gently to the spray of the water, and tall ferns swayed back and forth.

Stupe looked again. He glanced up the busy street with its shining windows, then across to where a crowded restaurant showed a newly painted front.

"Let's get something to eat," he said hurriedly. "I feel faint."

ORANGES AND TOMATOES GOOD FOR CHILDREN

Oranges and tomatoes are not only of great importance, commercially, to California, but they are also of the utmost importance in promoting the growth of young children and in keeping them well.

Prof. M. E. Jaffa, consulting nutrition expert of the California state board of health, has recently called attention to the newer discoveries indicating the importance of including these growth promoting substances in the diet of young children. Orange juice, because of its pleasant taste, is deservedly popular. The juices of certain green vegetables also have a beneficial effect in the dietary of the young, but oranges, not only because of their pleasant taste, but also because of their ability to withstand shipping and wide changes of temperature without spoiling, are almost as readily available as canned tomatoes. Fortunately tomatoes can be dried or canned without losing the properties that make this vegetable valuable in the dietary of young children.

California produces an annual crop of oranges valued at \$75,000,000 and a tomato crop that is valued at \$6,000,000. The commercial worth of these products is tremendously overshadowed, however, by their importance in promoting the growth and health of children, thus making them better American citizens.

INDIRECT LIGHTING PROTECTS EYES

Would you sell your eyes? Of course you wouldn't. But unless you are an exceptional person you are wasting them very rapidly.

Not long ago we substituted the electric and gas light for the old fashioned coal oil lamp. We think we have wonderful lighting systems. According to Forrest Knapp of Colorado agricultural college, the glare due to the use of the incandescent lamp is so great that it may counteract all of the good effects of increased intensity of illumination. Did you ever notice any discomfort from having an electric light in your field of vision? Do your eyes become tired more easily at night than in the daytime?

There are two main ways in which modern lighting is done—directly and indirectly. With indirect lighting the source of illumination cannot be seen but the light is reflected from the walls and ceiling, but when direct lighting is used the source may be seen. The latter is the more common.

If our eyes hurt, we get a larger globe and move it closer to our work. Theoretically this should be done. But how about experience?

It has been proved that after three hours work the efficiency of the eye is but little less when indirect lighting is used. The efficiency of the eye after three hours work in daylight is about 98 per cent. When an indirect light is used the efficiency is about 97 per cent. Not much difference. But when direct lighting is used this efficiency drops to about 15 per cent.

The intensity of illumination has little effect when indirect lighting is used, but a very great effect when the source of light is in the field of vision. The number of indirect lights does not decrease the efficiency to any noticeable degree, but when direct lighting is used the efficiency drops rapidly with an increase in the number of lightings units.

Save your eyes.

CANNING SUGAR BILL CAN BE CUT

It is possible to can fruit and have it keep, without any sugar. This does not produce the best flavor or consistency in the fruit. Excellent canned and preserved products may be made with a much smaller amount of sugar than is commonly used, adding corn or malt syrups in its place. The following proportions for syrups for canning and preserving have been tried and found good:

Thick: 1 cup syrup (white), ½ cup sugar, 1½ cups cold water. Medium: ¼ cup sugar, ¼ cup syrup (white), ¾ cup water. Thin: ½ cup sugar, 1 cup syrup (white), 3 cups water. One cup of honey may be used in place of one cup of sugar.

Creaking doors, windows and drawers may be stilled by rubbing with hard soap.

BUTTERFLY SALAD

On a foundation of lettuce leaves place a slice of pineapple, cut in halves with rounded edges together, which forms the wings of the butterfly. Cut stuffed olives in thin slices, and place on pineapple to form spots. After removing the seed from a date, place the date on top of the pineapple for the body. Thin strips of pimento radiating from the body make up the antennae. Whipped cream salad dressing is put on top of the body.

Whipped Cream Dressing

Two teaspoons mustard, salt to taste, 4 teaspoons flour, 3 teaspoons powdered sugar, few grains cayenne, 2 teaspoons melted butter, yolk 2 eggs, 2/3 cup hot vinegar, 1 cup thick cream.

Mix dry ingredients, add butter, egg and vinegar slowly. Cook over boiling water, stirring constantly, until mixture thickens. Cool, and add to heavy cream, beaten until stiff.

Parker House Rolls

Four cups scalded milk, 6 tablespoons butter, 2 teaspoons salt, 2 yeast cakes, 4 tablespoons sugar; flour, dissolved in ½ cup lukewarm water.

Follow the directions for making any light bread, until time for shaping.

After the last rising, toss on slightly floured board, knead, pat and roll out to one-third inch thickness. Shape with biscuit cutter, first dipped in flour. Dip the handle of a case knife in flour and with it make a crease through the middle of each piece; brush over one-half of each piece with melted butter, fold, and press edges together. Place in a greased pan, one inch apart, cover, let rise, and bake in a hot oven 12 or 15 minutes.

Quite frequently after the rolls start to bake I brush them with milk having a little sugar in it, which gives them a glaze.

MENDING BROKEN DISHES

New tableware costs real money nowadays, and frugal housewives are giving more thought to mending broken plates, cups, saucers, howls, etc., than they did when new pieces could be bought for a few cents. A clean break can be easily and securely mended.

Dishes that frequently go into hot water to be washed should be mended with waterproof cement. A cement that is soluble in water will not long hold the pieces together. Not all cements are waterproof by any means, although very satisfactory for sticking things not to be subjected to too much moisture. Most waterproof cements are pyroxylin compounds. Pyroxylin is made of cotton. One would naturally suppose that a stickum made of animal matter such as hoofs, fish bones etc., would be more water resisting than one made of fleecy cotton, but they are not.

BREAD AND CAKE BOXES

Nearly every farmer's wife owns a japanned bread box and cake box. They are usually brown with gilt lettering. There was a time when this tinware didn't cost much money. If a box rusted out it was carelessly tossed on the rubbish pile and a new one purchased. But price one of these boxes now! You will think twice before you chuck it.

And really it isn't at all necessary to let it get into a condition that will suggest discarding. If the japanning shows signs of wear, go to the store and buy a small can of colored enamel. Clean the surface of the box and apply a thin coat of the enamel with an ordinary varnish brush. The rust will immediately be checked. That will be much cheaper than a new bread or cake box.

PREDICTION DISPROVED

He (after popping the question)—Why are you crying, dearest? Did I offend you by my proposal?

She—Oh, no, dear; it's not that. I am crying from pure joy. Mother has always told me that I was such an idiot that I wouldn't get even a donkey for a sweetheart, and now I've got one, after all.

THE DIFFERENCE

"Have you paid your income tax?" "I rather think it was the outgo one I settled."

VOCATIONAL NAMES

The Call—Are you known as Mrs. Freemeter, your husband's pen name?

Beans: Ky. Wonder, 6@9. Beets: Doz., 40@50; sk., 2.25@2.50. Cabbage: Supplies moderate, market strong, movement good, wide range in quality. Best mostly 2½@3½ per lb., per field crate, best 2.75@3.25.

Carlots: Supplies of shipping stock light. Demand good, movement limited, market strong, few sales. Carloads f. o. b., usual terms. Cannonball and Winningsstad, per ton, mixed cars, 40.00@50.00.

Carrots: doz., 35@45; sk. 2.40@2.75. Corn: Local, 1.25@1.50 per box. Cucumbers: Market steady; local, best, lb., 50@75.

Egg Plant: Best, lb., 8@15. Lettuce: Local, cr., best, 75@1.00. Carlots: Few shipments, mostly on consignment. Quality generally poor, market steady, few sales mixed cars mostly, 1.75 per crate.

Peas: Northern: lb., 9@10. Spinach: Doz., 20@30; lb., 2. Squash: Local summer, large lugs, 60@80; flats, 50@60.

Tomatoes: Imperial and Coachella, supplies moderate; market steady; cr., best, 2.00@2.50. Turnips: Per dozen, 30@40; per sack, 1.00@1.25.

DECIDUOUS FRUITS

These are the actual prices obtained June 29 by the Los Angeles wholesalers in sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk.

Apricots: Local lugs, 1.15@1.50. Bananas: lb., 11. Blackberries: Supplies light; per crate, mostly 3.00@3.50.

Cantaloupes: Market weaker; supplies heavy. Imperial Valley: Standard, mostly 3.50@4.00; Ponies, 3.00@3.50; flats, 1.25@1.50.

Carlots: (Direct wire from Brawley). Haulings decreasing. Demand light, market firm, prices higher. Wide range in quality, condition generally good. Carloads f. o. b., cash track. Standards: Salmon Tings, 2.00@2.50, mostly 2.25@2.40; ponies, 50 lcs, mostly consigned.

Cherries: Supplies liberal; market firm; various varieties, best, mostly 15@18 per lb.; poorer, low as 10.

Gooseberries: lb., 10@12. Grapes: Thompson Seedless: lb., 12@15. Peaches: Supplies liberal, wide range in quality. Various varieties, lb., 5@7.

Plums: Best, lb., 5@9; poorer, low as 3. Raspberries: cr., 3.25@4.50. Rhubarb: Local, 1.00@1.25 box. Strawberries: cr., 3.25@4.25. Watermelons: Supplies liberal. Mostly 2@3 per lb., according to size.

Carlots: (Imperial Valley Section). Demand and movement good, market weaker. Carloads f. o. b., cash track—Brawley and El Centro—Angelinos and Klondykes, 25.50@32.50 per ton; Excels mostly 35.00@40.00 per ton.

CITRUS FRUITS

Grapefruit: California, per box, market pack, 2.25@2.75; special-packed brands, 3.00@3.25.

Lemons: Market unsettled, wide range in prices. Local Stock: packed, 3.75@4.50; loose, 1.25@2.25.

Oranges: Supplies liberal, market firm. Valencias: packed special brands, 126's, 5.50@5.75; 150's and 176's, 5.75@6.00. Local packed, mostly 4.00@4.50; larger sizes, low as 3.00. Packing house cuts, 1.00@2.00 per lug.

HONEY

Old honey practically exhausted, new supply light; few sales; demand good; movement limited. Carloads f. o. b., usual terms. New crop orange, 21; Hawaiian lt. amber, 17½. Old crop white amber sage, 19; wh. alfalfa, 19½. Beeswax, 42.

HAY

Alfalfa Growers of California, under-date of June 30, says:

The market for alfalfa hay this week showed a continued active demand in all parts of the state with prices well maintained at previous levels. The movement of hay is growing in volume but is still considerably lighter, especially towards the big markets, than usually at this time of the season. Almost all shipments go to fill sales previously made, so that daily shipments to be sold on track after arrival here, remain comparatively very small. Buyers, therefore, depend less on track purchases and buy instead for direct shipment to them as needed. This undoubtedly has a stabilizing effect on the market and is, therefore, beneficial to buyers as well as to growers. A somewhat disturbing feature, in view of the short production this year, is the fact that considerable quantities of hay are being sold for shipment out of the state in the shape of meal; prices paid for hay for this purpose range from \$18 to \$25 per ton, loose to the grower. There have been received on the tracks in Los Angeles, approximately 1,300 tons of hay of all grades during the week ending Saturday, June 26, which include 150 tons held over unsold from the week previous.

The market has held steady with prices approximately as follows: Choice alfalfa, 40.00 per ton, No. 1 dairy, 36.00; standard dairy, 32.00; stock alfalfa, 29.00.

GRAIN AND FEEDS

Barley: A little weaker, especially in spot stuff. Milo and mill feeds are a little stronger. There is a great range in price because of vast difference in quality. Forty-nine lb. bright barley is readily commanding 3.30, while 41 lb. barley, more or less stained, may run as low as 2.82½. Milo: Good bright, Imperial milo is commanding 3.55 and Eastern milo is running as low as 2.92@2.95.

Wheat: Utah-Idaho Milling, 6.00; feed wheat is running around 4.45@4.55.

Corn: Sacked, Yellow, 3.85@3.91½. Price bid local grain exch. cwt., June 29: General trend of market downward, especially on barley.

Barley: 2.86½@2.91½. Corn: Yellow, 3.770. Milo: Carlots, 2.87½; Eastern, 2.92½. Wheat: Mixed feed, 6.40@6.52½.

San Francisco Markets

San Francisco, June 29, 1920.

BUTTER

Quotations made daily by the San Francisco Wholesale Dairy Produce Exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by the wholesalers to producers are eight per cent less.

man, 1.25@1.50.

Raspberries: dr., 1.00@1.25; cr., 2.00@2.50.

Strawberries: Peninsula, dr., large, 75@1.25; small, 60@90.

Watermelons: Imperial Valley, lb., 2@4.

Honey Dew: cr., 2.50@3.00.

CITRUS

Box: Lemons, standards, 2.50@5.50; lemons, 1.25@2.00; grapefruit, 2.00@3.50; navel oranges, 4.00@6.00.

BEANS AND PEAS

California Bean Growers Association, San Francisco, June 28:

The market remains unchanged, except there is considerable inquiry for July, August and September business, indicating that trading will shortly be resumed.

Quotations this date:

Large Whites	6.25@6.40
Small Whites	5.75@6.10
Pinks	6.30@6.50
Cranberries	6.75@7.00
Black Eyes	8.25@8.50
Red Mexicans	8.50@8.75
Red Kidneys	14.00@14.50
Bayos	10.25@10.50

HOPS

1919 crop, 85@1.00 per lb. Prices to growers for 1920 crop, 65@80 per lb.

HONEY

Reported by Rafael & Wing:

Very little honey arriving. Not enough sales to establish prices. White orange offering in this market at 20@21. No change in wax. It is bringing from 40 to 42. From all indications, there will be a very good honey crop from the San Joaquin and Sacramento valleys. The sage crop in Santa Clara and San Benito counties is practically a failure. Some Honolulu honey offering, but not enough to affect the market.

GRAIN

Wheat: No quotations obtainable.

Oats: Red feed, 3.10@3.20.

Corn: California Yellow, 3.80@3.90 per cental; California milo maize, 3.45@3.50.

Barley: No. 1 feed, 3.05@3.15.

HAY

Under date of June 26, A. W. Scott Co. says:

Receipts past week 1688 tons. In San Francisco prices of hay are much lower and the market continues in duldest condition for many months, consumers and dealers declining to pay the prices asked. A much greater proportion of new hay is now coming in and old hay will be a thing of the past in a few days. Trading in the country has been likewise extremely light and in nearly all sections they have a local supply that is used up first and this naturally will change hands before outside purchases are made. Alfalfa is in light supply and prices are weaker and lower in all sections.

We quote today wholesale prices in carload lots (old crop) as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.)

Old Hay:

Citrus Markets

Los Angeles, June 30, 1920

Valencias, in fact all orange varieties, are bringing big prices in Eastern markets. Present estimates show 8,500 to 9,000 cars of Valencias remaining in the state for shipment, and a careful survey is now being made so that exact amount can be known. Central California has cleaned up orange shipments for the season. A bumper crop of Navel and Valencias is indicated for next season. The June drop has been exceedingly light.

Hot weather has ripened cantaloupes very rapidly. The recent hot spell in Fresno seriously cut down the fresh fruit output. Tokay grapes were the heaviest sufferers. It is now estimated that from 40 to 50 per cent of the crop was damaged. Emperors also suffered heavily; Malagas least with a possible 10 per cent.

Lemons from the Mediterranean are invading markets as far West as the Mississippi since the American dollar is worth three or four times the Italian equivalent. Italian shippers are throwing as much of their fruit as possible into this market. A quarter of a million boxes of lemons are now afloat and 50,000 boxes are now being auctioned in New York. California lemons are packed and ready to send on to Eastern markets in case of hot weather creating heavy demand.

Shipments

Shipments of oranges to date from Southern California since November 1, 1919: Oranges, 23,069 cars; lemons, 5,885; total, 28,952. To same date last season: oranges, 26,437; lemons, 7,206; total, 33,643. From Central California to date this season: Oranges, 5,370; lemons, 288; total, 5,658. To same date last season: Oranges, 3,698; lemons, 251; total, 3,949. Northern California this season: Oranges, 261; lemons, 23; total, 284. To same date last season: Oranges, 244; lemons, 2; total, 246.

AT THE AUCTIONS

bride business was obviously intended as an evasion of the gentleman's agreement, which will not work anyhow, as the Japanese government cannot control Japanese subjects in foreign countries. It did once. It still tries, with less success year by year.

"It is not generally understood that Japan not only does not recognize naturalization of its born subjects in foreign countries, but claims as its subjects children of Japanese parents wherever born. The child Japanese population of this state is increasing very rapidly, and every Japanese child born here is claimed as a Japanese subject, the constitution of the United States to the contrary notwithstanding.

"Our people have only good will to the Japanese. We make no claim that our race is 'superior' to any Oriental race and will raise not the slightest objection if Orientals claim to be our superiors. It is an academic question in which we take no interest. And neither, for that matter, does the Japanese government. The term is used to camouflage the desire for peaceful penetration.

"If the Japanese laborers will go away and stay away the two nations will always be friends. If they persist in coming here, as they seem to, we have no choice but to exclude them by name. We will not have them."

cess of paring without appreciable increase in waste over that which would occur if the potato were perfect. Loss of outer skin (epidermis) only shall not be considered as an injury to the appearance.

"Free from serious damage" means that any damage from the causes mentioned can be removed by the ordinary processes of paring without increase in waste of more than ten per cent by weight over that which would occur if the potato were perfect.

tons of unshelled and 300 tons of shelled. The Japanese peanut crop is normal this year, and the unshelled crop promises to yield about 25,000 tons.

Clarke County, Washington, has more than 600 boys and girls enrolled in agricultural clubs.

Federal Grades for Potatoes

Recommended by United States Department of Agriculture

STANDARD grades for potatoes were recommended by the United States department of agriculture and the food administration on September 10, 1917. The specifications were determined by thorough investigations conducted by the bureau of markets.

In order to reduce waste and conserve transportation facilities during the war emergency the food administration issued a rule, effective January 31, 1918, requiring the use of the United States potato grades by licensed dealers. The results obtained were so satisfactory that when this regulation was canceled on December 10, 1918, the use of the grades to a large extent was continued voluntarily. The universal use of the standards during the war emergency afforded the investigators of the bureau of markets an excellent opportunity to study in detail the various specifications and determine whether any changes were desirable. As a result a few changes were recommended on February 10, 1919.

Because of the large, bright, smooth potatoes grown in some regions, especially in sections of the Western states, those interested demanded a grade with higher requirements than those of U. S. Grade No. 1, in order to provide for stock of high quality, which is sold to a special class of trade. To meet this demand the U. S. Grade Fancy now is recommended, in addition to U. S. Grade No. 1 and U. S. Grade No. 2.

This recommendation does not mean that all crops of potatoes should be sorted into three grades. A large percentage of the commercial crop in most of the potato producing sections of the country should meet the requirements of U. S. Grade No. 1, and this grade will provide for most of the trade demands. Potatoes of better than average quality can be carefully graded and sold as U. S. Grade Fancy, while smaller potatoes, or those of inferior quality, can be marketed as U. S. Grade No. 2. It is probable that many of the commercial potato producing sections will have little use for the U. S. Grade Fancy.

Observations made in the producing sections show that there is a tendency to regard sizing as the only essential to proper grading. It should be emphasized that in addition to proper sizing by hand or machine, defective stock must be removed in order to meet grade requirements.

U. S. Grade Fancy

This grade shall consist of sound potatoes of one variety which are mature, bright, smooth, well shaped, free from dirt or other foreign matter, frost injury, sunburn, second growth, growth cracks, cuts, scab, blight, soft rot, dry rot, and damage caused by disease, insects, or by mechanical or other means. The range in size shall be stated in terms of minimum and maximum diameter or weight following the grade name, but in no case shall the diameter be less than two inches.

In order to allow for variations incident to commercial grading and handling, five per cent by weight of any lot may vary from the range in size stated, and in addition three per centum by weight of any such lot may be below the remaining requirements of this grade; but not more than one-third of such three per cent, that is to say, not more than one per

cent by weight of the entire lot, may have the flesh injured by soft rot.

U. S. Grade No. 1

This grade shall consist of sound potatoes of similar varietal characteristics which are practically free from dirt or other foreign matter, frost injury, sunburn, second growth, growth cracks, cuts, scab, blight, soft rot and damage caused by disease, insects or mechanical or other means.

The diameter of the potatoes of the round varieties shall not be less than one and seven-eighths inches, and of potatoes of long varieties one and three-fourths inches.

In order to allow for variations incident to commercial grading and handling, five per cent by weight of any lot may be under the prescribed size, and in addition six per cent by weight of any such lot may be below the remaining requirements of this grade; but not more than one-third of such six per cent, that is to say, not more than two per cent by weight of the entire lot, may have the flesh injured by soft rot.

U. S. Grade No. 2

This grade shall consist of potatoes of similar varietal characteristics which are practically free from frost injury and soft rot, and which are free from serious damage caused by sunburn, cuts, scab, blight, dry rot or other disease, insects or mechanical or other means.

The diameter of potatoes of this grade shall not be less than one and one-half inches.

In order to allow for variations incident to commercial grading and handling, five per cent by weight of any lot may be under the prescribed size, and in addition six per cent by weight of any such lot may be below the remaining requirements of this grade; but not more than one-third of such six per cent, that is to say, not more than two per cent by weight of the entire lot, may have the flesh injured by soft rot.

Definition of Grade Terms

As used in these grades:

"Mature" means that the outer skin (epidermis) does not loosen or "feather" readily during the ordinary methods of handling.

"Bright" means free from dirt or other foreign matter, damage or discoloration from any cause, to an extent such that the outer skin (epidermis) has the attractive color normal for the variety.

"Smooth" means free from second growth, growth cracks and other abnormally rough surfaces.

"Well shaped" means the normal, typical shape for the variety in the district where grown, and free from pointed, dumbbell shaped, excessively elongated and other ill formed potatoes.

"Free" means that neither the appearance nor the physical structure has been appreciably damaged by the causes mentioned.

"Diameter" means the greatest dimension at right angles to the longitudinal axis.

"Soft rot" means a soft, mushy condition of the tissues from whatever cause.

"Practically free" means that the appearance shall not be injured to an extent readily apparent upon casual examination of the lot, and that any damage from the causes mentioned can be removed by the ordinary pro-

TELLS HOW BANKERS CAN HELP FARMING

Secretary Meredith has sent the following telegram to W. F. Keyser, secretary of the Missouri Bankers Association:

"While I found it impossible to accept an invitation to attend the meeting of the bankers of Missouri in annual convention this year, I wish to take this means of commending them for the interest they have shown in agriculture in the past and to solicit their continued cooperation in the campaign for 'better farming, better business and better living.' There is much that the local banker can do to stimulate better business methods on the part of the farmers. He can also be of material aid to the extension of agencies of the United States department of agriculture and the state college of agriculture in reaching farmers with results of research.

"The increased demand for food by our increasing population must be met in the future largely by producing more per acre. Unless this is secured through the more general adoption of improved methods the increased production will result in ever increasing cost per unit of product. I wish to commend especially the work of the agricultural commission of the American Bankers Association. Its work is a recognition of the solidarity of the interests of agriculture and of the financial institutions of the United States. It is very gratifying that the bankers of the country, through their agricultural committees and commissions, are taking an active interest in the work of the department of agriculture and state colleges of agriculture. The bankers of Missouri can be of great service to agriculture and to the nation by supporting in every way the efforts of these two great agencies to aid the farmers of your state in the solution of the difficult problems confronting them. I wish for the bankers of Missouri a most successful meeting."

CALIFORNIA BEANS

About a dozen years ago California began sending out new varieties of beans that at once became popular in the states east of the Rockies. A boy in Ventura County walking through his father's pole Limas discovered two distinct types of bush Limas. These were fostered, the seeds sown and came true to type. Now they are known as Fordhook Bush Lima and Improved Bush Lima. A few years later a seed specialist at Carpinteria began selecting large Limas having a strong green tint and breeding from these fastened the color permanently. He then selected those having other excellent points aside from the green tint, and now one of the largest Eastern houses catalogues the "Carpinteria Lima" as "the very highest quality pole Lima in cultivation today."

JAPAN'S PEANUT CROP

According to a recent cablegram from Consul Robert Frazer, Kobe, Japan's probable surplus of peanuts exportable to the United States from the current crop will amount to 800

Operated by the tractor driver from the tractor seat. One man does it all. Moves more dirt with less power. The 5 foot size does the work of 3 or 4 four-horse scrapers. Saves enough time, horse-feed and labor to pay for itself in a few days. A size for every tractor. Prices from \$215 to \$335.

Send for descriptive circular and price list.

THE WOODWARD COMPANY FRESNO, CALIF.
Box 706

MOLINE

The Universal Tractor

800 owners in 43 counties in Iowa
hundreds of owners in 37 states

report a saving of one man and four to five horses per farm by using the Moline System of Power Farming. As a result of actual figures kept by owners, \$700 to \$2200 profit a year is being reported daily.

The Moline Tractor will do for you what it has done for others. It does two big things to increase profits—

- Increases production.
- Decreases the cost of production.

Increases production by enabling one man to plow more, harrow more, seed more, cultivate more, mow more, harvest more, than possible under other methods.

Decreases the cost of production by —

- Saving help because it increases production per man.
- Saving horses because it does all field work, including cultivation.

Thus the profit from the Moline Tractor is two-fold—it increases income and decreases expenses.

There is another phase of great importance aside from its money-making ability. The Moline Tractor makes farming more enjoyable—98 per cent of owners who have reported to us say so. It puts more speed into and makes easier many operations that have been drudgery.

The Moline Tractor is a powerful factor in keeping the boys on the farm.

Alkali and Some Other Soil Problems Discussed

By Prof. J. W. Nelson

VENTURA County has a live farm bureau. The members have live soil questions. They solve them when they can. When they can't they go to the university and say, "Come over and help us." So Nelson, the soil expert, came, and President John Eastwood of

the farm bureau took the trouble to get for Cultivator readers a very complete report of what Prof. Nelson said about soils in general and Ventura soils in particular. The initial picture was snapped by the Cultivator camera man, showing Prof. Nelson in characteristic pose, leaning on his soil auger.

I want to say right here that Ventura County farmers, as an average, are the best tillers in the United States. However, I do not know but what some of you are cultivating at least a third more than you need to. Some authorities say that after you get a good dirt mulch on the surface that is all that is needed, that impenetrable layer through which moisture cannot pass readily, and after the ground is in that condition working it over does no harm or no good. We have been doing that thing for years and years and have machinery all adjusted to that particular type of agriculture. I do not know whether or not we are getting maximum returns from it, maybe we are, maybe we are not. Test this system of drainage, this system of crop rotation, introduction of more desirable varieties of crops, control of moisture supply, proper consideration of organic matter, use of commercial fertilizers in an intelligent way.

In all big combinations the big profits lie in taking advantage of little, fine points and if they did not take advantage of these fine points I think many of

them would be broke today. They are nothing compared with this industry. Do you know that the capital invested in agriculture is about 75 or 100 times that of all the other big industries combined? When we think of the railroads, of the steel plants, the packing houses, we consider them big factors in the nation, but their capital is insignificant, is nothing compared with the capital invested in agriculture. They seem important because they are organized, are taking advantage of all the fine points. We have that before us in agriculture. Let us study out a plan, let us organize. I wish you could see this the way I think I see it. I believe the farm bureau movement is the biggest thing ever developed in this land for the farmers. It is the biggest chance in the world to do something for ourselves. I wish Ventura County were a little stronger in that line. There are many problems here to be solved. For instance, you do not have so many beans this year because you had trouble in handling last year's crop, the price is not good. How are you going to make the price good? By getting together, studying market conditions, working out the proposition from the production to the time the beans reach the consumer. The success of every specialized farming industry in this state is entirely due to business organization of the farmers.

We can help you work out your problems. We have drainage engineers who could come down here and look over this land and it will not cost you a cent. We are very glad to give you all possible support. You can call upon both the state and federal service for all we can give you in that respect. We need the products, you need the money. The problems before you need attention from an organized body of men. One farmer cannot get very far alone, but the whole body, well organized, moving together, can accomplish almost anything, as has been seen in other lines of industry.

I am greatly interested in soil problems and such like, but at the present time --(Continued on Page 42).

Firestone

LAST year Firestone lifted the 30x3½-inch tire out from all the sizes made and focused attention on it—as the *only tire size capable of quantity production*. And not only the tire user but the whole tire industry responded.

Firestone built an exclusive factory devoted to this size—and worked out a specialized way of manufacturing this tire in quantity—without a backward move—every tire good.

Today—while others are centering on the tire for owners of small cars, the Firestone 3½-inch is out in front with a highly specialized and bed-rock economical method of manufacture.

Firestone is two years ahead because Firestone saw two years ahead—and you owners of light cars get the benefit.

One Dollar Yearly

CONSTRUCTIVE thought cannot build upon the premise that present economic or political conditions satisfy a people restless under an intolerable cost of maintaining life or burying the dead.

Intolerance is a spirit fostered by capital and construed as stand pat patriotism. Every advance of wage secured by threat or strike is within a few months more than met by higher living costs. The allies of the Reds are those swollen with profits and watered stocks who refuse a compromise, will not reform, and continue the control of the necessities of life which all must have.

Production is faltering, our very reserve bank system has failed production in its hour of need, and it remains to be seen if the recent effort to lower prices on luxuries through withdrawal of credit on basic production, has not started the first stone of the avalanche of panic.

There is still time for the people and the country to travel a safe road to contentment and prosperity. Primer principles of economics and Christian ethics would remedy our ills, but the Golden Age is not yet here. Many of our profiteers have heeded the warning. The menacing growl from injustice has reached many banks and financiers and made them tolerant, but our food control is of bolder build, greater nerve and coarser fibre. A grasp and sway over the markets is still maintained, with daily increasing cost, which is merely added to food prices, and the spirit of the black book and reprisal is rampant for those who are in the way. No saving impulse minimizes serious blows at essential production and in this late hour of the country's needs the cattle industry, already crippled, has been called upon to meet increasing loss.

The effort to find a common ground between contending forces seems hopeless. But is it? Can we forget our prejudice and inclination, our raw edged nerves, our violent disagreement, our mounting debts, and firmly face our problems? Let us try and take the farmer's viewpoint. He subscribes to no destructive doctrine. The farmer is the one conservative of the nation, the home builder, the taxpayer, the corner stone of national well being, the defender of liberty when Paul Revere sounded his midnight call and when the Prussians threatened the freedom of the world.

Production is faltering. Lack of stability as much as lack of profit is responsible for lowered production. Millions of people have quit farming and stock raising already, and more millions are trying to, but this is no hopeless situation which we cannot remedy through constructive laws where needed and application of those now on the statute books. Wine ferments before it clarifies, bread seethes and bubbles in the making. A healthy open kick or crab hurts nothing and clears the air. The British tars were famous for their "grouch" at the time they won their brightest laurels.

On all sides we can see encouraging signs. We hear a well known old guard politician stating there is a tendency for too much government and too little representation. He tells

us that complicated and permanent bureaucracy and Prussian autocracy involve support of identical principles. We hear of a well known corporation lawyer asking for fair play in the trial of agitators whom he must personally dislike and despise. We hear the soldier son of a fearless ex-president exert a plea for a bunch of radicals elected to a state legislature. All these are little things but they show a broad and healthy trend. The American people can be depended on to follow their destiny and to reconstruct national economic problems upon lines which will stimulate production if they are allowed to be articulate.

Political chicanery robs them of their birthright of liberty and self government through diversion of their votes to ineffective channels, but our evils of boss rule, trust domination, wasteful government, unjust burdens upon basic production, and other evils are realized because the national conscience is sensitive and the national ideals are exacting. Look abroad and consider the plight of other people. Comparatively we are well governed, comparatively we are nationally and individually as pure as the driven snow when conditions in other countries are impartially reviewed.

We are a lusty nation and have not reached our full growth or strength. We have not reached our zenith nor that period of decay which destroyed the greatness of many nations in past history. The decline of every nation started with neglect of essential production, crowding into cities, replacing work with luxuries. We have a touch of the destructive malady, but the constitution and the good sense nationally to throw it off with work and fair returns for that work as a panacea.

The very elements of strength of this nation and the hope for the future lies in the present discontent with existing conditions. If men supinely accepted as inevitable the present distribution of political and commercial power and economic returns, with production thankful for its meager portion, we would have cause for fear of the future.

Labor has asked distribution on a new scale, constantly enlarging and increasing its demands. Payment has so far come entirely from production as manufacture and marketing have kept in advance of labor's demands. Capital has been badgered with unreasonable wage demands and threats until the sense of security and stability has become a hope instead of existing fact, and the result has been the wild scramble to get all they could while they can, called profiteering. Labor is dissatisfied today when it is reaping returns neither production nor capital could allow permanently. The labor union man is merely a percentage of the population. He isn't the people. The great farming and producing class outnumber him by millions. The union labor men and the farmers together would

Getting Together

By A. L. Spellmeyer

be the vast majority, but still there would be many millions entitled to representation. The farmer is dissatisfied, and most stock growers are broken men now, and it's these men who must work and produce before the union man has anything to eat. Fill the national larder first, safeguard its replenishment, and then you labor men and capitalists can fight it out with votes and due regard for the peace and rights of those other equally patriotic citizens.

Nationally we are one great family, and we have our quarrels, but don't bring in outsiders. The tactics of the foreign Red disgust and anger our 99 to one majority, and that ought to rule. We have seen nothing in the soviets to emulate or admire, and while our profiteering element is criminally inclined and grossly shortsighted to provide material for agitation, still even this profiteering is preferable to many foreign customs prevalent in Russia and the Orient. Condemnation of honest criticism and the effort to misname it as unpatriotic secures no result. Confusion of issues and temporary diversion of public investigations does not secure a permanent relief nor help reconstruction. Capital has inherited no divine right to place its wishes above the will or best interests of a people. Order depends on law, stability depends on order, and capital must have stability. Our great representatives of capital should be scrupulous in their observance of the spirit of law as expressed by existing government, as the observance of law means the existence and safety of their investments.

If the signers of the Declaration of Independence had been afraid to voice their thoughts we would have no free country now. Our national wealth and power are facts realized by the world, our potential economic strength greater than that of any other nations. In the recent war we have proven we are a fearless, active country, ready to risk and win when the need arises, a mass of brawn sensitive to a threatened loss of liberty, and not a hulking bulk of inert money worshippers.

The labor man, the farmer, the manufacturer and the merchant must have capital, and capital is merely the aggregated savings of a people invested in banks, which is finally manipulated through intricate machinery. The individual dollar is weak, but the bulk of many dollars is mighty and may enslave the multitudes who own it if manipulated by men whose only god is greed. All dollars are cautious and cowardly, yours, mine, labor's, capital's. Dollars require surety and stability before they will invest. Dollars hope for large profits but demand stability and fair interest.

Blind hatred of capital can bring no stability. A people quarreling and seething with dissension bring no inviting welcome of a safe haven for these dollars. Money is afraid, in big lots or in small. It's put in a sock

instead of being engaged in healthy work, producing something and causing a turnover to the benefit of its owners and humanity at large.

If a panic should come to the country tomorrow it could only be short lived, while national demand far exceeds supply. The threat is a far worse menace than the realized fact would be. But we may be hungry, and we surely will have high living costs if we don't get down to work and encourage our essential production. When we produce more goods than we can sell, at home or abroad, then we can expect hard times, but that's some time off, as there is shortage of everything from big steers to water meters and from autos to money. Ill timed efforts have called cattle loans, forcing prices down, making inevitable less cattle later and higher prices. That is the endless circle, and we are told this was done to make the meat price lower to consumers. A conspiracy to promote agitation would not have had any greater success than the blundering of a bureaucracy in fooling with the economic machinery, removing the cottar keys and nuts in a repair effort, and then putting on the power. More production is the remedy and key note for lower living costs, and that production must have its profits, two cottar keys and double nuts to insure that healthy stimulating profit. Making the path between producer and consumer shorter, paving it with stability and safety, will help, then inevitably greater production will bring lower costs of food, economic security and city prosperity.

All this wild socialistic theory of Marx and others is based upon hatred and tinged with impractical brains. Marx could not even meet the issues of practical life in his time nor provide adequately for his wife and babies. We must have capital, the aggregated savings of a people, and when we hate it we merely hate ourselves. We must stabilize our money, capital, our concentrated credit, our whatever it may be called, through safety, and correct improper handling or abuse of the power it gives. We want the hundred cent kind of capital and should gladly pay it six per cent, but we don't want the 35 per cent kind we have right now which, owing to insecurity, demands its enormous interest or hides in its shell. Our value units merely represent so much purchasing power which enable us to eat, clothe ourselves, educate our children, provide for old age and attempt to safeguard the well-being of the coming generation.

Who cares if wheat is a dollar a bushel or five, if meat is two cents a pound or 50, if the cost of every element entering into the production of that wheat or meat is proportionate?

Work, stimulated production through fair profits, and stability for capital to make possible more production, more irrigation and power projects, more railroads, would bring us all more prosperity and economic health. There is a common ground for agreement if we will all use our possibilities of compromise, restrain our greed, curb our hatred and go to work.

Difficult problems are ahead but this country has its destiny and will fulfill it. Salvation comes through travail of spirit, the child arrives after labor. We have much to hope for, and if the present discontent has helped us understand the other fellow we can be thankful for it and eventually secure the fulfilment of our national hopes and ideals.

Agricultural News Notes of the Pacific Coast

Northern California

The Ward nurseries at Eureka have been purchased by Seattle florists.

Directors of the Placer County farm bureau will meet at Loomis on July 24.

The thermometer reached 115 in the Sacramento Valley during the recent hot wave.

Chico, Butte County, reports damage to apricots from recent hot spell and north wind.

The Glenn-Colusa reclamation district has advertised for bids for construction work.

A farm center poultry culling demonstration was held at Chico, Butte County, last week.

Experienced packers are wanted by fruit growers of Placer County. Some inexperienced help can also be used.

Grace Brothers of Santa Rosa are putting in a fruit and berry dryer. It is 160 by 200 feet and is built of cement.

Boys' and girls' agricultural clubs in the Durham district of Butte County will raise pigs and calves in their coming contest.

The Colfax, Weimar and Applegate farm bureau centers of Placer County joined in a Fourth of July picnic at Woolley Flat.

Farm Adviser Harrison of Yuba County has asked the supervisors to require licenses of all persons desiring to spray orchards.

Farm adviser of Placer County is collecting and shipping to cold storage fruit for the Placer County exhibit at the state fair.

Almond growers of Durham, Butte County, recently listened to talks by Professors Taylor and de Ong on almond cultural problems.

The gasoline situation is reported much better in the Sacramento Valley due to the lessened demand for gasoline for harvesting machinery.

Manager Sheehan of the Grape Growers Exchange says there will be no drop in the price of grapes from the \$65 a ton set by the exchange.

Hayward, Alameda County, apricot growers say they are getting no offers from canneries. Peaches are being contracted at from \$100 to \$125 a ton.

For failure to supply irrigation water to his rice fields P. N. Ashley of Oroville has recovered \$1,800 damages from the Sutter-Butte Canal Company.

Farm Adviser Sullivan and his assistants have completed a "farm and crop map" of Sutter County showing location of farm centers, principal crops and orchards and soils in different sections.

The California highway commission has agreed with Mendocino County to construct three bridges across Long Valley Creek and one across Outlet Creek, the county to pay \$20,000 to the commission.

The members of the Castro Valley farm home department are responsible for a very successful picnic at which they entertained the members of all the farm home department centers in Alameda County.

The secretary of the Japanese Association of Northern California has just returned from a visit to Japan and says that Japan will have no rice to export the coming season in competition with the American grown product.

Central California

The dairymen of California met at Modesto June 26.

Another big fish cannery will be built at Monterey.

Tulare will hold its county fair at Visalia, October 9-16.

The Fresno County farm bureau held a hog auction on July 9.

Fruit driers installed at Lodi are ready for the season's grape crop.

Modesto's June shower held up harvesting for a day or so but did no material damage.

The California Peach Growers report gratifying number of signers of renewal contracts.

The board of supervisors of Tulare County has contributed \$1,000 to the premium fund of the county fair.

Monterey and Santa Cruz Counties report a short crop of Newtown Pippins. Bellflowers will give a better than average crop.

Onion growers of San Joaquin County are unable to harvest their onions at present prices and are compelled to disk them under.

The cannery at Hinckley, Fresno County, will start on peaches. Delay in delivery of fuel oil made it impossible to begin on apricots.

The first car of apricots for the cannery of the California Cooperative Association at San Jose was shipped from the Stanislaus Growers Association.

Stanislaus County will have a display at the state fair at Sacramento for the first time in several years. County Horticultural Commissioner Rutherford will have charge of the exhibit.

Farmers in the Acampo section of San Joaquin County have signed agreements that they will not sell lands to Japanese, Armenians, Turks, Greeks or Hindus.

The Santa Cruz News is urging that restriction be placed on abalone fishing. The News states that the abalone meats have become so popular that this shell fish is in danger of being exterminated.

The California farm bureau marketing association reports top prices at recent sales: Tegner, June 2, 187-210 pounders, \$14.10; Fresno, June 18, 208 pounders, \$15.65; Bakersfield, June 19, 208 pounders, \$15.55.

It is reported that Japanese associations of the Valley are collecting a large fund with which to print and distribute propaganda to offset the sentiment in California against their acquiring farm lands.

By majority of nearly eight to one the voters of the Fresno irrigation district authorized its establishment. This district takes in 246 acres immediately adjoining Fresno. It is one of the units of the Pine Flat project.

The Tulare Register says that reports from sections about Tulare show there has been a rise in water level in practically all of the wells. The snow on the mountains has melted gradually and the gravity flow is said to be remarkably good.

Over 500 persons visited the W. Sam Clark fig ranch near Sultana, Tulare County, on Sunday, June 20. The principal subject discussed during the orchard demonstration was pruning of Adriatics to bring down cost of picking and also to increase crop yield.

Southern California

The cannery at Banning has begun on apricots and cherries.

Two hundred acres of barley grain was burned at San Jacinto last week.

El Cajon, San Diego County, wants to have an agricultural course in its high school.

The Elsinore cannery will not operate this season because of the short apricot crop.

The Yucaipa Apple Growers Association has decided to install a sizer in its packing house.

There is a proposal to establish a summer hotel on the summit of Mount Baldy 10,000 feet above sea level.

The Ventura County farm bureau is considering the wool situation and the possibilities of a state wool pool.

Demonstration of dust spraying for control of insect pests was made in the orchard of J. T. Walthall at Hemet on July 6.

A party of cotton growers of the Imperial Valley is making a tour of cotton growing fields in the Salt River Valley of Arizona.

The Covina Poultrymen's Association held a meeting on June 23 at which Cornele G. Ross of Pomona was the principal speaker.

Hemet canneries are exceedingly busy places. Apricots are averaging well in size. Jam and marmalade are made from the small fruit.

The regular annual meeting of the California Lima Bean Growers Association will be held at Oxnard, Tuesday, July 13, at 10 o'clock.

Malaga grape shipments will start from the Imperial Valley about the middle of July. Carloads of Thompson Seedless are already moving.

Professor R. H. Vaile of the Riverside experiment station has been holding demonstrations in Riverside County on moisture penetration and irrigation.

Thomas Rawson of Rawson Valley near Hemet is said to be the largest bee owner in Riverside County. He estimates his 1920 crop at 2,500 cases, all of which is contracted at 24 cents a pound.

A. M. Nelson, for several years county development agent of Imperial, has died. Mr. Nelson was a very young man but had already done much for the valley in his official capacity. He served with the overseas forces during the war.

The San Diego County highway commission has advertised for bids on construction of the Coronado-Chula Vista road, the Julian road from El Cajon to Foster, the Mission road at the north end of Poway grade, and the Wynola-Julian road.

An Illinois visitor to Brawley says that he visited every hotel and eating place in the town and couldn't buy a cantaloupe to eat. He said: "I come here and want cantaloupes and watermelons and I see them shipping millions of them but I can't get one."

The Pacific Electric railway has applied to the railroad commission for permission to increase all city fares outside of Los Angeles to seven cents and in Los Angeles to create two zones in the present five cent limits, the inner or five cent zone to extend 2½ miles from the center of the city, the outer zone fare to be ten cents.

The Coast and General

The Hood River, Oregon, county fair will be held September 17 and 18.

An effort is being made to increase dairy herds in Kitsap County, Washington.

The National Apple Shippers Association will convene in Chicago August 11-14.

Skagit County, Washington, will hold its county fair at Burlington August 9-14.

Twelve cents per pound is being paid for cherries at the Yakima, Washington, cannery.

Cotton crops of Arizona have had ideal weather this season. The growth has been rapid.

The annual picnic of the Clarke County, Washington, farm bureau will be held August 19.

Shipments of cantaloupes from the Salt River Valley of Arizona began on the last day of June.

The cantaloupe crop of the Salt River Valley of Arizona is reported as having a heavier set than usual.

Canadian wheat growers have made a profit of 40 cents a bushel on their original government guaranteed price.

Arizona reports summer showers have set in over the ranges and stock are already showing great improvement.

The Deschutes County, Oregon, fair will be held this year at Redmond at the same time as the Redmond potato show.

The Oregon Growers Cooperative Association now has 1,300 members representing 26,000 acres of fruit and berries.

Hood River Valley, Oregon, claims to have 20,000 acres of orchard fruits marketing through the Fruit Growers Association.

Members of the farm bureau of Clarke County, Washington, will make a two days excursion through prune orchards of the county.

The Arizona Cattle Growers Association and the Arizona Wool Growers Association closed yesterday a two day convention at Flagstaff.

The Oregon Duroc-Jersey Swine Breeders Association held its annual picnic at Salem on June 5. More than 100 breeders were present.

Eastern Oregon sheep owners have begun bringing in flocks for summer pasture on logged off lands in the Hood River national forest.

At the recent annual meeting of the Fruit Growers League of Jackson County, Oregon, W. H. Bingham of Medford was elected president.

Apple shippers from the Wenatchee district of Washington are busy with railroad officials trying to secure adequate transportation facilities.

The Colorado Potato Shippers Association held its third annual meeting at Denver, July 2 and 3. Transportation problems were the most serious among those discussed.

According to report of the state department of horticulture the Wenatchee district of Washington is the only one that will produce as large a crop of apples as last year.

A series of farm bureau fairs will be held by nine different sections of the Clarke County, Washington, farm bureau in the fall just preceding the Western Washington fair at Puyallup.

A Small Evaporator for Household Use

By W. V. Cruess, Fruit Products Laboratory, University of California

THE evaporator described has been designed for household use in drying fruits and vegetables on a small scale. It will hold from 25 to 50 pounds of fresh material at one loading. It may be built by any one who is able to use a hammer and saw. All of the materials needed will be found on the farm or may be purchased at the nearest hardware store.

The drier is a little too large to be conveniently used over the kitchen stove and is designed to be operated by a small gas plate or ordinary coal oil heater. It has been found best in practice to operate the drier independently of the kitchen range because for

Door

The door is made up of the following materials: Two pieces 1 inch by 1 7/8 inches by 14 1/4 inches; two pieces 1 inch by 1 7/8 inches by 32 inches; five pieces, 3/8 inch by 6 inches by 18 inches; one piece, 3/8 inch by 2 inches by 18 inches; three small hinges; one small hook clasp. Above the door is nailed a piece 1 inch by 4 inches by 18 inches to brace the frame and a piece 1 inch by 2 inches by 18 inches below the door for same purpose.

End

The end opposite door is made up of: Two pieces, 1 inch by 1 7/8 inches by 14 1/4 inches; two pieces, 1 inch by

boxes to raise it above the level of the stove used as source of heat.

Asbestos

The legs, the lower parts of frame, and door and lower six inches of inside walls must be covered with heavy asbestos to prevent the drier taking fire during use. This precaution is necessary. See photograph.

In Room 204 of Hilgard Hall at the university at Berkeley is located a drier built after the above specifications. Those interested and who are within reach of Berkeley may see this outfit and thus obtain a clearer idea of its construction. The drier was made of rough materials, by inexperienced labor and represents a result that any one should be able to duplicate or improve upon.

Trays

The trays are made up as follows: Size 13 3/4 inches by 24 inches over all; two pieces, 1 inch by 3/8 inch by 24 inches; two pieces, 1 inch by 3/8 inch by 11 3/4 inches; two pieces, 1 inch by 3/8 inches by 13 3/4 inches; two pieces, 1 inch by 3/8 inch by 22 inches; one piece, ordinary door screen, 13 3/4 inches by 24 inches. Eight trays should be made. First cut the screen to size indicated above. Place two pieces 1 inch by 3/8 inches by 24 inches on work table and the screen over them. Across ends over the screen nail the two pieces 1 inch by 3/8 inch by 13 3/4 inches. Between these end pieces and over the side pieces nail the two pieces 1 inch by 3/8 inch by 22 inches.

keep operator informed of temperature conditions.

Operation

Apricots and peaches are pitted, pears peeled, cored and cut in quarters and lengthwise, and apples peeled, cored, and sliced about one-quarter inch thick. To preserve the natural color fairly well, dip the prepared fruit in a dilute salt solution containing three tablespoons (level) per gallon of water, leaving the fruit in the brine one minute. Do not rinse it. If a bleached color is desired spread the fruit on the trays and stack the trays in the drier placed on ground in the open. Cover top of drier opening and temporarily the openings around bottom of the drier with boards or burlap. Place small pan of burning sulphur on the ground and close door. Leave one hour. Dry as directed below.

Prunes, Thompson Seedless and Tokay grapes are dipped in a boiling lye solution contained in an agate (not aluminum) pot. This solution contains one level teaspoon of lye per gallon. The time of dipping for prunes is about 30 seconds, and for the grapes above given about five seconds; long enough to crack the skins. Rinse in water and spread on trays. Muscat grapes are similarly dipped but a lye solution containing five level tablespoons of lye per gallon of water is used at boiling point about 20 to 30 seconds and the grapes rinsed in water.

Potatoes, carrots, beets, turnips are

most fruits the drier must be operated 12 to 24 hours at one time and the use of the range for heater interferes with the preparation of meals or when used between meals causes the expenditure of an excessive amount of fuel. Only a small amount of heat is needed for the drier.

Size

The drier stands 42 inches high; of this height, 36 inches is made up of the walls and top, while six inches represents the legs. It is 32 3/8 inches long by 18 inches wide over all, and of 14 1/4 inches by 30 inches inside dimensions. It carries seven tray runways spaced four inches apart. Each tray is 24 inches by 13 3/4 inches over all. The bottom of the drier is open except for a piece of sheet metal 11 inches by 18 inches, hung in this opening to act as a heat distributor. The top is closed except for an opening 14 1/4 inches by four inches near door end. One end of drier is formed by a door, and one end is closed.

Thoroughly dried non resinous wood should be used. Redwood is very good for the purpose.

Sides

Each side consists of the following materials: Two pieces, 1 1/2 inches by 1 1/2 inches by 30 inches for top of frame; two pieces, 1 1/2 inches by 1 1/2 inches by 41 1/2 inches for sides of frame; two pieces, 1 1/2 inches by 1 1/2 inches by 27 inches placed six inches from bottom; six pieces, 3/8 inches by 6 inches by 30 inches; seven pieces, 1 inch by 1 inch by 29 1/2 inches for tray runways.

Assemble the frame. Cover with the 3/8 inch by 6 inch material and four inches apart on center. First runway is placed six inches above bottom of lowermost 3/8 inch by 6 inch piece.

1 7/8 inches by 36 inches; six pieces, 3/8 inch by 6 inches by 18 inches; one piece 1 inch by 1 7/8 inches by 18 inches placed below last 3/8 inch by 6 inches piece to brace legs. The 3/8 inch by 6 inch material of sides, end, and door form the inside walls of drier, the frame is to the outside. See photograph.

Top

The top is made with an opening equal to inside width of drier and with four inch wide opening which is located four inches from door end of top. The following pieces are used for the top: Two pieces, 1 7/8 inches by 1 inch by 14 1/4 inches; two pieces, 1 7/8 inches by 1 inch by 30 inches; three pieces, 3/8 inch by 6 inches by 18 inches; two pieces, 3/8 inch by 4 inches by 18 inches.

Legs

The four pieces of 1 1/2 inch by 1 1/2 inch by 40 inch material forming frame of sides project six inches below the bottom of the drier and form the legs.

Radiator

A piece of sheet metal about 11 inches by 16 inches by 18 inches is hung from its four corners by wires, looped over nails driven to the frame. This sheet metal should rest about one inch below bottom of lowermost 3/8 inch by 6 inch pieces forming sides of drier. It is used to distribute the heat evenly.

Heater

A small gas plate or coal oil heater or very small "air tight" wood or coal burning style of heating stove or small ordinary heating stove or large kitchen range may be used as source of fuel. It will be necessary in most cases to place the drier on bricks or

Photograph of Completed Drier

Showing tray, tray runways, and heating system consisting of piece of sheet metal and small gas plate. A coal oil heater or air tight heating stove may be used instead of gas plate.

Turn tray over and nail to the ends the two pieces 1 inch by 3/8 inch by 11 3/4 inches. See photograph for appearance of finished tray. This makes a reversible tray three-eighth inch deep and 24 inches by 13 3/4 inches over all.

Thermometer

Purchase a 75 cent dairy thermometer at the nearest drug store. Use it on lowermost tray at all times to

peeled, sliced and dipped in boiling water one minute. String beans are prepared as for the table and are dipped ten minutes in boiling water; peas, five minutes; corn, ten minutes on the cob; then is cut from the cob. Dried corn is a pleasing product.

Place loaded trays in the drier with end of topmost tray placed against door; second tray against rear wall of drier; third against door and so on (Continued on Page 42)

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

USING POWER

The labor situation "is getting no better fast." There is, however, vast improvement in the manner of the farmer's accomplishing the impossible. Notwithstanding the shortage of gas, there is a vast increase in the use of gas engine power on the farm. The shortage of hydro-electric power has caused great increase in the use of the internal explosion engine, but much of this increase would have come in any case. The car window view up through the great valley shows literally hundreds of combined harvesters and threshers operated by tractors. In one grain section we recently noted five of these great outfits in one view.

The use of gas is economical; it is effective; it is necessary.

STOCKYARDS WOULD HELP

All is not going well with the livestock men of this state. The general situation can be summed up in mighty few words. Few men are making any profit out of their operations. Dairymen and pork producers are actually going out of business at a sacrifice, and their brothers in distress, the cattle men and the sheep men, can't!

The above statement is no mere

facetious remark; it is the cold fact. High feed and labor are forcing many a dairy cow to the shambles and high feed is putting a lot of hog raisers out of business. On the other hand the cattleman, loaded up with fat steers, carrying the heaviest overhead charge ever written against any former market crop, fails to interest buyers at prices considerably lower than have been offered during the past two or more years, and the sheep man is up against the proposition of having no market for his wool and little or no demand for his lambs.

That such a situation is temporary goes without saying. At the same time that does not help out right now. Eventually our livestock resources and

FUNDAMENTAL EVIL OF JAPANESE LAND OCCUPATION

A statement written by United States Senator James D. Phelan for readers of the California Cultivator. Senator Phelan writes that as soon as possible "I will send you an article on the occupation of farm land by the Japanese in California, whither I go tomorrow." This letter was written early in June and things have been moving in Senator Phelan's home town, which is now quieter, and we hope we may soon hear from him.

The tone of these few words is such that we are expecting a most frank and convincing statement from the senator. We wish all statements touching upon this vexing question might be as fair and contain as little which will generate race prejudice as does Senator Phelan's statement.

My objection to the occupation of the soil of California, either by ownership or lease, by the Japanese agriculturists, is fundamental. I am aware of the shortage of farm labor and of the flattering statistical showing which is due in a considerable measure to the activities of the Japanese. But we can better afford to have less production and more genuine prosperity. A prosperous state is one which supports a patriotic population, homogeneous in character, contributing to the social and religious life, upholding American institutions, and ready with their lives to hold their ground and defend their flag. When any element enters into the community which disturbs its equilibrium, weakens its system, or threatens its life, no mere production of wealth for a short time or a long time can compensate the state for the loss. A foreign substance has entered the body politic which can not be assimilated. It deranges the human economy and, unless encysted, causes disease and ultimately dissolution. For example, a Japanese family takes a farm from a white family. The white family contributed to the community life in all its branches and the proceeds of its labor circulated freely, carrying benefits wherever they went, and still remaining in the community. The Japanese are unsocial, yet gregarious, deal with one another, and send back to their country the net results of their thrift. Their presence and their impossible competition not only expel the whites but prevent other white people from settling in and developing the state. The amazing growth of the Japanese by immigration and by a high birth rate easily forecasts the ultimate fate of California, which, unless there be remedial laws, will become an Oriental colony. It would be better for the fields to remain uncultivated until a desirable population is attracted than to foster an evil which, like the genii of old, will rise to slay us.—James D. Phelan. June 8, 1920.

practices will be adjusted to fit conditions — nothing being more certain than that producers will not continue to produce at a loss.

How the adjustment will be made remains to be seen. There are several angles that may be taken advantage of, but one thing is certain, we must seriously consider the problem of more stable and satisfactory markets for our livestock. The time is at hand when we must lay aside our prejudices and set about developing markets at our principal killing centers that will at least give us as fair a run for our money as producers in other sections enjoy. With practically 90 per cent of the livestock of the United States going through union stockyards, it would seem that such a plan of selling must be the most satisfactory. We are further inclined to that feeling when we note that many of our producers who talk loudest against such a plan are themselves shipping out of the state to points maintaining stockyards.

The Cultivator is prepared to admit that certain evils can develop around packer controlled stockyards, but we believe that such evils are not to be compared with those operating under our cumbersome system. It is a lot easier to wallop a producer on his home range and with no one looking on than it is on a big open market — at least the temptation is greater.

Frost protection was the subject of discussion at the last meeting of the Riverside Citrus Center at Fairmont Park.

RICE VS. OTHER CROPS

Driving along the bank of the Sacramento River something over a hundred and fifty miles north of the city of Sacramento we recently saw pumping plants, the installation of one of which cost around a quarter of a million dollars, and these plants were lifting and pouring upon rich lands many rivers of water from the one great Sacramento. The wealth of this wonderful river and its meaning to this state was made very plain by these rivers of water and by tens of thousands of acres of lands covered by these waters and through which the wealth bearing rice was showing. In one district alone there are between 110,000 and 120,000 acres covered with

Valley from using the waters of the Sacramento River. The order was signed by Judge A. B. McKenzie and is effective at 8 a. m. July 12. The city's suit was based on the contention that use of the river's water was depriving the city of Antioch of an adequate water supply.

"Judge McKenzie set the time for a hearing to show cause why the order should not become effective for 10 a. m. July 8.

"Among the 330 defendants to the suit are nine irrigation districts and 20 agricultural companies. The irrigation districts are the Willows, Jacinto, Providence, Princeton-Cadora-Glenn, Maxwell, Compton-Delavan, Cordua, Honcut-Yuba and Sutter River."

Some of the Antioch and other delta users of the waters of the Sacramento claim their rights to the waters of the river were established 50 or 60 years ago. This priority cannot be denied by the upper water users, but they do set up the claim that the production of \$25,000,000 worth of one crop means much to California and that while its use should not be denied to those whose rights were established many years ago, the use of a great river of water to hold back the tides of the Pacific is an awful waste, and suggest that there should be some system of locks devised for the Sacramento River which might enable the use of these wealth giving waters and at the same time prevent the tides from carrying salt waters to productive land.

IMMIGRATION OF JAPANESE

That the number of Japanese in this state is increasing and that some illegally here have been ordered deported is shown by the census and by reports of the commissioner of immigration. That the figures proving these facts have not always been used correctly is shown. The California Cultivator has endeavored in treating this subject to handle it as a purely economic question concerning the people of this state and this country. We have appealed for a cool discussion of the facts and what it means to the state economically to have within it a race which cannot and probably would not wish to be assimilated. We desire to refrain from statements which would lead to conditions like those which prevailed during the anti-Chinese demonstrations of some years ago. We have repeatedly said that there is no question of superiority or inferiority. In fact, we have often stated, in effect, as we quoted last week from the San Francisco Chronicle:

"We make no claim that our race is 'superior' to any Oriental race and will raise not the slightest objection if Orientals claim to be our superiors. It is an academic question in which we take no interest. And neither, for that matter, does the Japanese government." But our desire has been to show the facts as to conditions, and in doing this in our paper of nearly a year ago we quoted from some other paper which purported to give an official statement by Commissioner of Immigration Caminetti to the senate. This statement we made as having been reprinted by the Sacramento Bee. Editor McClatchy of that paper has written, asking as to the source of this quotation and stating that it is in error, for his paper never quoted it as given.

At this distance it is impossible to say where these figures were obtained other than at the time we were making hundreds of clippings from papers from all parts of the United States. The reprinting of this statement has called forth the following from John P. Irish from which we quote:

* * *

In your issue of January 31 you (Continued on Page 46.)

water and growing rice. This use of the waters of the Sacramento covers a period of but few years, in fact, only three years in nearly every case. The wealth created in these fields has called for comment of the economists of the state and nation. The state produced in 1915 considerably less than a million bags; in 1919, over three and a half million bags, these commanding from six to eight dollars per bag, or well up towards 25 millions of dollars. The present year's planting has been the greatest ever.

Now comes the rub, however, in the water to make these fields profitable. The taking of these rivers of water from the Sacramento, together with the light early snowfall in the Sierra Nevada, have caused the serious condition which is confronting the farmers and fruit growers of the lower Sacramento delta lands. The waters of the river are so low that navigation is practically discontinued above the city of Sacramento. The tidewaters of the Pacific are thus permitted to bring their salt water farther up stream than has ever been known. The growers of pears and other fruits, of asparagus, spinach and potatoes, are forced to accept the alternative of withholding water from their lands or destroying the crops with the salt water. To secure relief they have gone into the courts and, as quoted by the daily press:

"The city of Antioch, Contra Costa County, on July 2 secured in superior court a restraining order forbidding 330 rice growers of the Sacramento

Growers Discuss Pathology of Citrus Trees

AT the Porterville meeting of citrus growers the methods advocated by P. A. Boncquet, plant pathologist of Tulare County, were explained by Mr. Boncquet and endorsed by many of the growers present. Horticultural Commissioner Charles F. Collins was unqualified in his approval. The condemning of winter cover crops, and of some cultural and pruning methods was not unanimously endorsed.

The meeting was called by the county pathologist in conjunction with the Porterville chamber of commerce of which R. H. Morrison is secretary and manager. Mr. Morrison presided at the meetings.

Mr. Boncquet's first talk had to do with soil and nitrification. Nitrification is not possible in soil compacted and water logged, nor on the other hand if entirely dried out. Two plowings per year were recommended. Once in fall while soil is dry "plow very deeply, at least 12 inches. Leave lumps. Do not cultivate. Plow again in spring, not quite so deeply. Do not plow deeper, nearer the tree, than the rim or drip of tree. Do not cultivate. I do not believe in dust mulch. Never use sub-surface packers. Irrigate often; every week if possible but very shallow. The orange is a surface feeder. No winter cover crop, but for summer plant cantaloupes." Some were present who had tried cantaloupes but were unable to get them to grow because shade in bearing orchard prevented. There were none who had succeeded.

One method of procedure advocated for bog soils was the use of sulphuric acid in dilute solution.

By P. A. Boncquet

The soils here spoken of are the "Porterville adobe," the "Olympic adobe," and the San Joaquin sandy loams as indicated on the California soil map edited by the bureau of soils. The soil samples were taken in the neighborhood of Lindsay. It was also in the Lindsay orange district in the orange grove of Dr. C. B. Root that the first practical results from use of sulphuric acid were obtained. The results have been so remarkable, so rapid, and so convincing, for the betterment of the groves, that at present more than 1,500 acres are under the sulphuric acid treatment.

Colloids of the Soil

A colloid is of the nature of gelatin or jelly. There are colloids which when they are dry have the property of again becoming soluble in water. They are called reversible colloids. There are other colloids, which when they become totally dry, fall in powder and become insoluble.

Sulphuric acid destroys the protective colloid and gives reasonable soil management opportunity to bring the soil back to fertility. From sticky and viscous the soil becomes finely granulated, the air and the water penetrate easily, the roots of the trees can function again.

Results Obtained

This crumbliness of the soil after the sulphuric acid treatment can now be examined and investigated in our experiment of last fall. The soil in question was not different from many other soils where the puddled condition can be observed. Today the soil which was treated is crumbly for about a foot and a half in depth. So perfect is the crumbly nature that it can be lifted with the foot without losing its structure even when plenty of moisture is in the soil.

Other Effects

Sulphuric acid converts the black alkali to white alkali and thus renders it possible to wash out the salts from the soil. Black alkali is eight times more toxic to the plant than white alkali; consequently sulphuric acid increases the fertility of a soil by the mere fact that it renders the soil a better habitat for plant life.

Sulphuric acid liberates the phosphoric acid in the soil, renders it soluble and available. The potassium salts are likewise disintegrated and become more abundantly available.

Effect on Plant Growth

Sulphur in the form of sulphuric acid is a plant food. It was generally

assumed that the soil contained always a sufficient amount of sulphur as plant food. The fact that the addition of sulphuric acid immediately stimulates plant growth, seems to do away with at least the generality of that assumption.

On addition of sulphuric acid to the soil in very dilute solutions the orange trees gain new vigor. The yellow and mottled leaves become an intense and heavy green. The growth of the trees where the experiment was started last fall has been three times the growth of previous years. I am even of the opinion from what I have seen that sulphuric acid does cure certain kinds of mottled leaves. Where the sulphuric acid was applied last fall the trees have set a heavy crop.

Sulphuric Acid and Nitrification

Sulphuric acid in dilute solutions has a wonderful effect on the nitrifying power of the soil. The fact that the colloidal matter is precipitated and the soil becomes more porous would naturally lead to such results, but the actual test of the increase in nitrification has demonstrated that the intensity of the bacterial action can be doubled for one and the same soil. I am now conducting field experiments to corroborate these findings under field conditions.

Mode of Application

The application of sulphuric acid presents quite a number of difficulties that actual experience alone could bring to our attention. Before everything it should be applied in a very dilute solution. If the solution is too strong it becomes toxic to plant growth and will certainly hinder instead of stimulate it. In all our experiments we have not had a single case where even the slightest damage has been done but we have all the time insisted that the solution should be very dilute. It takes for some of our soils more than ten tons of sulphuric acid per two acre feet of soil to neutralize the total carbonates. It is only when all the carbonates have been changed to sulphates that the soil can become theoretically acid from the sulphuric acid. In my experiments I have used only 200 to 300 pounds of sulphuric acid per acre. All the desirable results were obtained with that small amount. In the main I consider that 200 pounds of sulphuric acid per acre applied in two successive irrigations will change the colloidal nature of the soil to about a depth of one foot.

How to Dilute

The sulphuric acid is run in the water a cubic centimeter per miners inch, per minute, hence, to nine gallons of water one centimeter of sulphuric acid is added. I have tried as much as ten cubic centimeters per inch without any effect on the plant, but I judge that the concentration is too strong where the water is free from carbonates and where the soil has most of its carbonates converted to sulphates.

In the beginning of the experiment I used glass syphons to distribute the sulphuric acid in sand box to distribute the sulphuric acid in the water. The point of the glass tube was so drawn out as to have the required volume of acid, but the air bubbles in the sulphuric acid soon collected in the syphon. This necessitated the very unpleasant work of amorphing the syphon. Thereupon Warren Towt, a progressive grower of Lindsay, devised a more practical way. A brass bung was made and covered with tin. Two block tin tubes were soldered in. To one a glass stop cock was attached. The other tube was so arranged that it relieved the vacuum in the drum as rapidly as the acid was drawn off. The whole drum was placed on a rail above the sand box. The bung then turned down, the glass faucet regulates the inflow, according to the number of miner's inches. The second block tin tube is turned on top of the drum.

Possible Results

I expect the reinvigoration of our side hill orange orchards. These groves have been and many are still producers of the most wonderful Navel oranges grown. The bringing back of these orchards to their initial productivity will mean a new stimulus to the orange industry. The

dry bog hill sides are practically frost free. The fruit on those hills is thin rinded and smooth. The sugar content and the luscious Navel taste is most intense. These soils are eminently fertile, but the accumulation of the colloids to a depth sometimes of two or three feet made them an impossible habitat for the roots of the Navel tree. The soil became impervious to water and to air; its management became well nigh an impossibility even in the hands of the most energetic and most intelligent grower. Sulphuric acid will help the plow, the subsoiler, the spring tooth harrow. It will help the irrigator, it will reduce the cost of orchard management and make the soil again the best soil for orange groves.

The practical results now obtained are proof that these expectations are justified. Even critics not ready to accept the theory but thoroughly versed in dry bog conditions could not help but admire the results. The soil treated last fall acts like a sponge to water, is resilient to the foot, does not bake hard, does not run together from the water, there is no plow pan.

The soil is in the best condition for nitrification up to a few inches from the surface. The trees are covered with new growth. The crop is abundant.

SEVERE INJURY TO PEACHES BY THRIPS

What is apparently a new species of thrips is doing great damage to peaches in the deciduous fruit sections of San Bernardino County. Harry S. Smith, in charge of the office of pest control, made a survey of the problem last week at the request of Geo. P. Weldon, pomologist of the Chaffey Junior College of Agriculture. So far no satisfactory means of control have been worked out, but Mr. Weldon is now engaged in making life history studies upon which the necessary control measures may be based.

Reports from Akron, Ohio, state the demand for automobile motor truck tires at present shows an increase of more than 200 per cent above the output a year ago.

There's Real Service Back of the OilPull

1. *The tractor itself* with inbuilt dependability, economy and long life.
2. *The Rumely factories* that have been building farm power machinery for over eighty years—127 buildings covering 195 acres—a perfect assurance of permanency.
3. *Twenty-nine branch offices and warehouses*—complete stocks of machines and parts—located at important railroad points to give quick service.
4. *Three thousand dealers*—most of them specially trained in the Rumely factories—and possessing the ability to give genuine service.

And your order for an OilPull gives you this four-fold service throughout the life of the tractor. Shall we send details.

Almond Huller, \$415.00

Manufactured and Patented by
L. K. VAUGHAN, 172 Elm St., Woodland, Cal.

Some Smiles For The Farmer

Have you seen the Almond Huller that don't wear out the fingers and you don't have to stand at the stacker and see the meats going into the hulls as loss? With this machine you can hull or crack all the nuts and no waste at all and have time to go to all the fairs and no worry. Write for any information. 1 1-3 tons in 10 hours guaranteed.

Build Up Your Soil With Whip-Poor-Will Cow Peas

WHAT THEY WILL DO:

They make the best summer cover-crop.

Maintain a moist surface mulch.

Will prevent June drop.

Require less irrigation than other crops.

Need no irrigation where soil moisture has been conserved.

Build up poor soils with more nitrogen bacteria and humus than any other covercrop.

Afford the best kind of pasture for cattle and hogs.

As a hay have a food value of 43% more than Alfalfa.

Will improve your silage.

There is no better Bee Pasture.

Thirty pounds of seed is sufficient to plant one acre.

Our seed germinated 96%.

Dried Fruits and Vegetables

By Ernest Brauntton

At Burbank in Los Angeles County, onions and cabbages are apt to be blown about the country. This is not because of wind velocity but the reason of the dryness of the vegetables. The dehydration plant of the Burbank Canning Company has been in full swing only since May 22, but an extension of the main building has already been found necessary, another drying unit is being installed, and before another week passes the capacity of the plant will have been doubled.

Manager C. R. Henderson showed a Cultivator representative through the plant from reception of the fruit from the grower's truck to the dried product ready for shipment. The first run was made on rhubarb, requiring six to eight hours to dry. The stalks are cut into pieces an inch in length. In curing the natural color and aroma have been retained. The second product processed was cabbage, requiring the same time in drying as the rhubarb. It is first run through a slaw cutter and the finished material is as white and light as soft pine shavings. It would easily blow away if exposed to a good breeze.

The third run was of Coachella Valley onions, and these dry as white and light as the cabbage. They also are dried in from six to eight hours. They have a mild nutty flavor that is quite attractive. One does not notice any onion flavor until thoroughly masticated. Then comes the recoil and one realizes the sliced chaff still is onions. The full strength of taste and smell is revived by cooking.

The Apricot Season

On June 26 the plant started on apricots and will continue as long as the fruit is available. This processing requires nearly twice as long as for the vegetables, or ten to 12 hours. Some very large and fine apricots have been dried but the great advantage of

such local plants to the fruit grower is that he may here market his second grade and overripe fruit. The product, in appearance at least, is superior to the sun-dried, the color being much brighter.

The fruit is halved and pitted by a crew of girls, just as in a cannery. It is then run into a steam blancher for from three to five minutes, which opens the pores and sets the color. From here the trucks are run into the dehydrator, the last lot pushing former lots farther into the dry air, for the hot air moves in the opposite direction from the feeding of the fruit, so the driest fruit first meets the hot current. The temperature stands at about 160 degrees Fahrenheit. It is quite pleasurable to see this fruit so quickly and cleanly dried, away from the dust and dirt so often incident to sun drying.

The consumer, of course, soaks the fruits before cooking, as is done with all dried fruits, but onions, cabbages, etc., readily return to their original form and value in the cooking process. The writer saw both the vegetables mentioned perfectly recovered in cold water.

The late world war was responsible for the scientific development and perfection of dehydration and has left it as a heritage for peace. Dried vegetables will be largely used on steamships, in mining camps, fishing camps (as in Alaska) and all centers of activity far removed from the truck farm. They also reach the housewife thoroughly prepared for cooking. All agricultural products may be perfectly processed, and the fact that plants may operate every day of the year in California is no doubt largely responsible for the increasing number of dehydrators being installed in this state. With one in every locality the farmer need not let his produce rot in the field because of low prices in the shipping market.

Pickling Olives

A bulletin has just been issued by the United States department of agriculture on "A Chemical Study of the Ripening and Pickling of California Olives," written by R. W. Hiltz and R. S. Hollingshead.

Following a general description of olive culture and varieties in California, the olive picking season, changes in composition of the olive during ripening, and methods of pickling, this bulletin reports the results of an extensive investigation, undertaken in 1914 and continued through 1916, to determine whether immature olives were being pickled and sold as ripe, and also whether inferiority was being concealed by a process of coloring.

The plan of the investigation was to follow during successive seasons the development of the fruit on marked trees of different varieties and in different localities, recording changes of composition and physical characteristics, especially color, to determine possible differences between the immature and ripe fruit, and the relationship between color and maturity of the fruit. The laboratory methods of examination consisted of a physical examination of the samples as to color, flavor, ease of cleavage of the pulp from the pit, short diameter, number of olives per pound and percentage by weight of pits; and a chemical analysis of the flesh and of the pits. Different lots of olives were followed through the pickling process and examined in a like manner.

The results of the examination of the fresh olives showed that during the ripening, after the pit is formed, the pits remain practically constant while the growth in the flesh continues. This is accompanied by an increase in moisture content and in oil, the latter increasing at first rapidly and then more slowly. The color changes noted were from a green in September to a dark purple in December or January. The olives with the deeper colors were usually larger and heavier than the others from the same tree or grove and had the most oil and solids in the flesh. This was not always true, however, in compar-

ing olives of the same variety from different groves or localities.

Data obtained on pickled olives showed that the process had little effect on the size of the olives or on the percentage of pits. The solids-not-oil showed a notable decrease from the fresh fruit, and the oil a corresponding increase, rising from about 60 per cent on the dry basis for fresh ripe fruit to 70 or 72 per cent for the same after pickling. The color changes during processing were very marked, green or yellow olives often forming a blacker final product than purple olives. The best color was developed in olives showing some red at first, the fully ripe purple olives tending to lose their color and become brown or tan.

The conclusion drawn from the results of this investigation is that the best index of maturity for olives, both fresh and pickled, is the percentage of oil in the fruit flesh. A minimum oil content of 17 per cent in the flesh is recommended as a tentative standard of maturity for Mission olives and other common varieties except the Manzanillo, for which a standard of 15 per cent is recommended, and the Ascolano and Sevillano. The latter have to be gathered when relatively immature and should not be sold under the designation "ripe." It is emphasized that the proposed standard must be applied with caution because of the great variations noted in the composition of olives of the same variety grown in different localities. It is thought, however, that the data presented will make possible the detection of fraud in the pickling and coloring of immature olives to simulate pickled ripe olives.

FROST PROTECTION OF LEMONS

Messrs. Shamel, Scott and Pomeroy of the U. S. department of agriculture are co-authors of a report on frost protection in lemon orchards, a ten cent publication which may be had by writing Superintendent of Documents, Government Printing Office, Washington, D. C. The bulletin touches on

methods of orchard heating, objects of investigations, plan, behavior, heated and non-heated plats, comparison of injury in different varieties, and other valuable data. The authors summarize:

"Extremely low temperatures during December, 1912, and January, 1913, caused serious damage and loss to unprotected lemon orchards in many sections of Southern California.

"Detailed records of the proportion of merchantable and frozen fruits produced in five heated and five non-heated acre plats of Eureka and Lisbon lemons during the calendar year 1913 and in two comparative plats during the calendar year 1914 in the Corona lemon district are presented in this bulletin.

"These data show that in orchards which were protected with an adequate supply of heaters during the cold weather of 1912-13 a large percentage of merchantable fruit was saved and harvested throughout the year.

"In orchards which were not heated a large proportion of the lemons picked during the first six months following the freeze were frozen or unmerchantable, and the trees did not return to normal production until a year had elapsed.

"Non-heated orchards which had received good care prior to the freeze of 1913 and also during that year had returned to normal production by the beginning of 1914, and the heating during the cold period in 1913 had practically no effect on the second season's crop.

"In unprotected orchards, under comparative conditions, a greater amount of injury was found in the Eureka than in the Lisbon variety. The differences were not sufficiently great, however, to warrant the conclusion that there is any considerable difference in the hardiness of the two varieties. Such differences as appeared were entirely due to differences in the habit of growth of the two varieties, the Lisbon having denser foliage."

DRYING APRICOTS

For the benefit of new members, or rather those new at the game of drying apricots, the Prune and Apricot Growers gives in *Sunsweet Standard* the following drying suggestions:

It is not easy to write directions explicit enough that a novice can pick and dry 'cots without danger of costly mistakes. Nevertheless, some general directions may help in the absence of an experienced director.

Apricots ought to be entirely ripe when picked for drying. When over-ripe and very soft they fail to hold their shape and make slabs, which are good fruit but unsightly and lose market value.

The lug boxes of 'cots are brought from the orchard to the cutting shed. The tray, usually three by eight feet, is placed on wooden horses of convenient height and the 'cots emptied on the tray, a box at a time. Beginning at one corner of the tray with a little box in which to drop the pits, cut each 'cot in halves with the pit removed and lay the halves with the cut side up as close as they will lie till the tray is covered. A second tray can be set on the first and filled, and so on till too high for convenience.

The trays are then piled on a field car so the ends overlap back and forth, called staggering, that the sulphur fumes may the easier get between the trays to all the 'cots. Put from 15 to 20 trays on the car and run it into the sulphur house, which should have but very few cracks for smoke to escape, yet if the house is too tight the sulphur will not burn. In an iron dish or hole in the ground, under and far enough below the trays to avoid setting them afire, put from four to six pounds of sulphur and light it with a match and piece of paper.

Close the door and leave for three or four hours, or until the sulphur fumes have penetrated the entire fruit, which can be told by cutting a half.

There is little danger of sulphuring too much. If the sulphur is lighted in the evening the 'cots can be left in the house all night.

Spread the trays on the dry ground with sides touching and a pathway left at the ends. The time to dry depends on sun and wind. When the 'cot has a leathery feel (in the cool of the day) and is not easily mushed between the fingers, it is probably dry enough to stack the trays and let them cure a few days in the shade.

There is one investment that a large percentage of both prune and apricot growers have made and never regretted, namely, an investment in trays and other drying facilities. The establishment of a dry yard establishes an insurance of marketing opportunities. In a few districts where the growers are not so equipped they are decidedly at a disadvantage, having no recourse from green sale. When prices and market opportunities are better known there will come the necessity of deciding between drying or green sale. In apricots especially the decision is in many instances difficult and influenced by conditions not at first considered.

As we make sale for canning purposes we are required to pick the firm fruit, whereas riper specimens are suitable and better for drying purposes. During the last few days if the ripening fruit hangs on the trees it gains very largely in sugar content and consequent weight so that it is impossible to compare and figure dried tonnage from a cannery sale. Some growers have figured that ripe apricots picked for drying purposes will weigh up to as much as ten per cent more than the same apricots picked green for shipping or canning. Taking this situation into consideration we can moderate the five or six to one shrinkage of drying when we compare dried and green sale opportunities. In addition to this the cannery picking

requires more careful supervision and labor—to some extent more expensive. On top of this we have one other item to be considered; namely, the expense of cutting and drying. As another item in favor of drying, we should not lose sight of the consequent pit production and the excellent market that has developed for this product.

SUMMER SPRAY FOR RED SPIDER

Prof. de Ong is recommending summer spray for the red spider pest. He writes:

"Use of sulphur, either as dust or liquid spray, will check the summer form of red spider on plum and prune trees. Farmers are advised to apply the spray at the first sign of infestation.

"The mixture should be made of two gallons of concentrated lime-sulphur solution combined with five pounds of cooked flour paste, into which five pounds of fine sulphur has been stirred. This will make 100 gallons of spray mixture at a cost of about 80 cents or \$1. A thorough drenching of the trees requires about eight gallons per tree. Use this spray only on almond trees; it is too strong for prune or other orchard trees."

The Oroville plant of the California Olive Growers Association has been taken over by the California Packing Corporation.

COMMERCIAL EVAPORATORS

Three small commercially built evaporators will be installed at the University of California farm, under the joint supervision of the division of viticulture and fruit products and the division of pomology. Tests during the coming fruit season are to be made for comparison with the University of California farm evaporator by Professors W. V. Cruess, A. W. Christie and F. E. Neer.

Accurate comparisons are planned to be made upon the yields obtained in the various evaporators, quality of the product, fuel consumption, cost of operation, and between sun drying and artificial drying. The season will be started with apricots and will be continued with peaches, prunes, grapes, pears and apples.

ASSISTANT SECRETARY OF AGRICULTURE

Elmer D. Ball of the Iowa agricultural college has been appointed assistant secretary of agriculture.

"The department of agriculture and the agricultural interests generally are particularly fortunate," said Secretary Meredith, "in securing the services of a man who has such a wide knowledge of the agriculture of the country and who is so intimately familiar with the problems that the farmers have to solve."

Canners are paying \$110 a ton to Fresno County growers for cling peaches, \$70 for Lovells, and \$60 for Elbertas.

The Reward of Many Years

THIS Company has lived a remarkable history. To tell it in the way of history would be to unfold a story of many pages—a story as wide as world-agriculture and nearly as long as a century.

But the story is being told every day in vital and more interesting terms. It is being told in countless fields of the nation, where **Titan Tractors** are steadily turning kerosene into farm power. Here is summed up the true history of Harvester purpose and success. It is a story of action, rather than of words.

In 1831, Cyrus McCormick placed

the first reaper in the grain field and opened the way to a future full of vast possibilities. Then began a manufacturing career that has placed millions of practical machines on American farms and now finds its most modern expression in the **Titan 10-20 Tractor**.

It is no accident that Titans today are toiling the world over, to the end that farm harvests may be greater and better. This tractor is the careful product of ninety years' accumulated endeavor, experience, and contact with the problems in farming. That fact accounts for **Titan** predominance.

SMALL EVAPORATOR

(Continued from Page 37.)

down to the lowermost tray, which is against the door. This leaves a six inch space between each tray and wall or door making it necessary for the rising hot air to travel across each tray or a total distance of over 15 feet to reach the outlet of drier. Start the fire and so regulate it that the lower tray is maintained at 140 degrees Fahrenheit to 165 degrees Fahrenheit.

When lower tray is dry, remove it; shift the other six trays down one tray and insert a fresh tray on the topmost runway (that is, if there is still more product to dry). When lowermost tray is dry, proceed again as just directed.

Probable Cost

It should be possible to build the drier complete without stove for not to exceed \$15. The cost will be less if scrap lumber from "about the place" is used; and more if it is necessary to buy a small heater and to use new lumber. One man's time for eight hours was needed to build the drier in use in our laboratory.

For further information on methods of drying, the reader is referred to Farmers' Bulletin 984 of the United States department of agriculture, Washington, D. C., obtainable free of charge on application to the above department.

ALKALI AND SOME OTHER SOIL PROBLEMS DISCUSSED

(Continued from Cover)

my particular work is not exclusively in that line. However, what spare time I have I generally give to the study of any problems that are presented to me along that line. I have spent 20 years looking at things from the field point of view. As has been said, I have had the pleasure of mapping the soils of Ventura County and also of about 85 per cent of the agricultural regions of California. The idea of that work is that we believe different species and varieties of plants have a soil and climatic environment in which they reach their greatest perfection. We as farmers in the past have not given much attention to that idea, thinking most of the time that most any species of plants will grow under most any conditions, but we have lived in general agricultural days and have not given a great deal of attention to specialized lines. We are gradually approaching European conditions and conditions where we have got to get down to business farming and know how to get the fullest returns from the soil. When we do that we will be face to face with the fact that there are certain soils that are not best adapted to certain crops, and it is up to us to try to locate in different sections of the country the different kinds of soils and then work with the farmers to see if we can finally locate the types of crops that do best on those particular soils. The idea of soil mapping is to show the different kinds of soils and then study the chemical and physical properties to see what bearing they have upon the crop, the idea being to try to work in time down to that range of crops that will give as near 100 per cent as possible.

I feel that about 90 per cent of the citrus orchards are only about 60 per cent normal; that is, the crops are only about 60 per cent of what they should be. Forty per cent, in my estimation is almost the difference between success and failure. Of course many orchardists are taking advantage of most of the information they can get in order to make the best of their land. They are a little more up to date than farmers in other lines. In far too many cases the farmers are getting out of the soil only from 40 to 60 per cent of its possibilities, and in analyzing the thing down it is very evident that that difference of 40 to 60 per cent below efficiency decides the question of success or failure, and this is the thing we are working on, trying to analyze conditions so as to be able to know how to get maximum returns.

In mapping this great region here we found that in past ages the ocean cut back to the hills and this was a bay with a shallow depth of water. In this bay was deposited sediment washed down from the high land, which finally filled it up, and the grad-

ual uprising of the coast region and the alluvial deposits have left this great delta through here. It is a recent body of soil. It is a soil that is still in the process of formation. You know that in wet weather there are streams that cut across sections of this county and deposit fresh sediment, so we call this recent soil, as compared with older deposits on the high lands. Recent soils have a uniform cross section; that is, except for the different stratifications caused by water action. The older soil in the uplands is entirely different. It was laid down uniformly, but time has acted upon it to change it very materially and much of the fine material has been carried down to the lower levels, which has caused a heavy subsoil. In the upland areas the heavy subsoil is not deposited by water but carried down by the percolating action of water, while on the low lands the only heavy subsoil is the plow pan or that deposited by water. These soils also differ in that their mineral composition has not been materially changed. The gypsum, lime, etc., has not had time to be washed out and they are usually well supplied with lime, while the uplands have, naturally, lost most all of their soluble minerals. Those soils, being more thoroughly drained, lose their water more quickly and are unable to support much of a growth of native vegetation, so in many instances they are relatively deficient in organic matter. In my survey I did find some upland soils that were dark colored, but that was due to another reason of which I will speak later. The general tendency of upland soils is excessive drainage, removal of excess salts, removal of alkali, while low lands contain all their own salts plus some accumulation from the uplands carried down by water. These soils are in their infancy. In the hardpan stage the soil is on the decline.

In our experience in mapping soils we found there are two things responsible for dark colored soils and the dark color in soils is always related to the organic matter present. If a soil is dark colored it is pretty safe to assume it is high in humus content. Soils in a semi-arid country, deficient in rainfall, low in lime, are usually deficient in organic matter. Some of these upland soils are black and contain humus, and that is simply due to the great excess of lime. We have found strips of upland soil black and rich in humus, while almost adjoining them would be soil deficient in organic matter. It looked strange to us and we thought by analyzing the soils we might be able to solve the problem and thereby be in position to suggest something to increase the fertility of soils. We found upon analyzing the dark colored soils an exceedingly high lime content—from ten to 30 per cent—and practically every particle of the native grasses grown upon such soils was converted into humus, which is the staple form of organic matter. Lime had the power of converting the organic matter into humus, while the other soil low in humus was low in lime and the organic matter was oxidized and passed directly back into the air and the soil received no benefit. It was the same as it was 10,000 years ago, except that it had gradually lost its fertility, while the other body of soil had converted the organic matter into humus, increasing its water holding capacity, and was capable of holding its supply of winter rainfall at least two months longer, simply because the added organic material gradually worked down until the soil became dark colored way down deep and produced several times the amount of vegetation that the other soil did. In producing fertile soil, I consider the two big things are control of soil moisture and the organic matter. These two things are the very heart and life of successful and enduring agriculture in the semi-arid West, and if we as farmers can control those two things it will be possible to attain maximum production with minimum outlay and still maintain the fertility of the soil.

Let me draw attention to a picture to illustrate the difference between the two soils. Suppose we could take a cubic inch of soil and magnify it to a cubic mile. We would see about 30 to 50 per cent of the total volume of that area in air space, called pore space. That is the area in which the air circulates through the soil. We might be able to walk down and take a look around. If we looked up

through the one kind of soil, low in organic content, we would see only small deposits of organic matter clinging to a large number of big boulders. In that mass of material we would see struggling creatures wallowing about seeking for something to devour and work on. Those are the bacteria of the soil, of which there are about 100 varieties. They would be feeble and inactive, not able to do what they wanted to do in that soil, subdividing very slowly; in other words, marking time, waiting for an improvement in conditions enabling them to perform their natural function. We would also notice in that mass of material the air would be about as free and fresh as the air we breathe, an unfavorable condition for plant growth. It has been found that in fertile soils the soil atmosphere is so dense that a human being could not live in it. In other words, soil atmosphere must be highly charged with organic acid or carbon dioxide and other gases if it is going to be favorable for plant growth. That condition would not be present in poor soils. Further, we might see that the rainfall passing down through that mass of material would be just about the same quality of water as found at the surface, an unfavorable medium for the solution of plant food. In other words, it would be perfectly fresh water, incapable of dissolving plant food. That combination of conditions would not bring about conditions favorable for plant growth; plants would starve even though there were thousands of pounds of plant food near by. I might mention conditions now developing in the western part of Kansas, which is a dry farming area dependent upon a limited rainfall, where they must grow such crops as can mature with the amount of rainfall received. The soil is being robbed of its organic content until within the last 50 years it has declined 30 per cent. A careful examination of crop yields in a five year period has shown that the crop yields in that area have also gone down 30 per cent and it is not unreasonable to suppose that in the next 50 years the western half of Kansas will have gone back to the pasture stage. So, in parts of Nebraska and North and South Dakota. An analysis of the soils in the western half of Kansas shows that they contain enough potash and phosphoric acid to mature an unlimited number of crops, yet the plants in that area are starving for potash, starving for phosphorus because they are not available.

Let us look at that mass again. In the soil relatively well supplied with organic matter we will find the interstices between the soil grains filled with a spongy mass of material called organic matter. In that we would see countless millions of these bacteria wallowing about, digesting and working in that material, looking for leguminous plants to store up nitrogen; where there would be one in the other place there would be at least a million over here, and they increase by the million every 24 hours until the soil is a mass of life and action, which is what we would call a perfect laboratory soil, operating 100 per cent under nature, and we must approach that condition as nearly as possible if we expect to get 100 per cent from the soil. Over here we have the unfavorable condition which often accounts for the 40 per cent deficiency which I mentioned and which we need to make up the profit in agriculture. In the ideal soil the soil air, passing down, soon becomes charged with carbon dioxide, a by-product of bacterial action, the soil water becomes an active solvent, releasing plant foods in sufficient amounts to supply the requirements of the most exacting crops. There is the condition we need if we expect the best results—that is the thing we want to work to.

We as farmers, I think, in the past have been too much inclined to depend upon hearsay, the experience of our neighbors, which is of course often very valuable, and our own casual observations above ground. We have not looked beneath the surface to know what is going on. That is the thing we should do more, and I predict that in the next five or six years we will know much more about what goes on beneath the surface of the ground. In the last year farmers in this country have lost thousands of millions of dollars because of failure to act on the regulation of moisture conditions in the soil. Most of the damage in the fruit orchards has been

due to deficiency of soil moisture in late fall and early winter. We have been thinking that after the fruit was harvested the tree could take care of itself until the winter rains. As a result in these dry years conditions have become so unfavorable that we have lost thousands and thousands of dollars, purely as a result of failure to supply the tree roots with moisture at a critical time. It is just as necessary to irrigate during the fall and early winter as it is during the time the fruit is setting. People are becoming alarmed and are beginning to seek a remedy. We have been judging from surface conditions. We have been supplying water according to the apparent needs of the vegetation above ground, while it should be added according to the needs of the soil, not according to the indications on the plants above ground. I suppose 99 out of 100 farmers have been deciding when to irrigate by scraping with the foot a foot or so below the surface, or waiting until the plants wilt. I want to say that when a tree begins to wilt it is already calling for a supply of water and it began to suffer before it began to wilt, and as soon as it begins to wilt and every day the wilting continues it is passing through a period of shock, attempting to adjust its functions to meet the scant supply of moisture. In delaying that one irrigation the tree has passed through a three, four or five day period of shock. Now, we apply water to that orchard, say, five or six times during the year and if we wait until the tree wilts, it has passed through several periods of shock, which certainly reflects through the whole physiology of the tree. Take a condition of that sort through a period of years and it will result in dead wood, stubby growth, not sufficient vigor to put forth buds for the next year and generally an irregular and declining orchard. An accumulation of a number of small factors through several years is responsible for most of the troubles in our orchards. It is very much like an individual doing a full day's work on a full day's ration and at periods of every ten or 15 days the ration is cut down one-half and he is still forced to go on and do a full day's work. You know what condition he would be in in a very few months. He would gradually decline because he could not keep up on that deficient ration. It is identically the same with the plant, it must be given a proper supply of moisture if it is going to give maximum returns.

In the application of water we should get into the soils to know when we should irrigate. We now have worked out in the laboratory what we call a maximum, an optimum and a minimum or wilting point in soil moisture. The optimum content is when plants are doing the best possible work. In Los Angeles County, where I have been conducting some moisture tests, we went into an orchard where after the long, cold spring the trees were late in coming out, the bacteria was not manufacturing much nitrogen and this particular orchard was at that time in what we call the optimum moisture condition, the ideal condition, and the trees were begging for the nitrogen and the soil was in condition to deliver it in maximum amounts. The orchardist put on an acre foot of water, lowered the temperature, checked the bacteria and set the whole orchard back two or three weeks. He should have kept the water off for several more weeks until the soil went down to the wilting point. This was lack of proper knowledge of soil conditions. We have those conditions all worked out and our experience is available to all, which is one of the beauties of the farm bureau movement throughout the state. The federal service and the University of California are back of this movement. We as farmers have great possibilities for doing something for ourselves and I will guarantee that any community that will get right down and work as one man, support the farm bureau movement, take advantage of everything it has to offer, will accomplish astonishing things in a short time.

I am one of you, I have farmed all my life, and I say to you farmers we have got to organize. The rest of the world is organized and we are the only fellows who are still struggling about and have not got our bearings. There are big problems ahead of us. There are problems that are absolutely vital to the welfare of this in-

dustry. Soil fertilization and soil moisture are only two of a thousand important problems of agriculture. The way to handle problems is to work together with the farm adviser.

To study moisture conditions of soils you should have a soil auger. Every farmer and particularly every orchardist should have one. I consider it is a most important investment. Every orchardist ought to go over his orchard four or five times between irrigations, to see how the moisture content is holding up, to see if the soil is delivering water to the plant roots. In an orchard in the South I saw a man putting enough water on his orchard to wet the soil ten feet deep in the upper part of the orchard to get three feet on the lower part. The roots of the trees in the upper part were rotting, were just about drowned, and he was killing his orchard. All this because he was ignorant of the simple principles of soil moisture control. He had never looked below the surface. He had added water at definite periods according to the calendar and had not considered the soil needs. When the soil was saturated, he was irrigating, and as a result chlorosis was spreading right down his orchard.

The intelligent consideration of soil moisture conditions is a definite factor in the West. We ought to add just the amount of water necessary to give 100 per cent returns, if possible, and if you take a soil auger and bore down you can in a very short time by feeling that soil tell the moisture content within one per cent, tell if it is at the wilting point. When there is 15 per cent moisture in light soils no water is needed for a week or ten days, until the moisture content is down to four, five or six per cent, when it is time to prepare for irrigation. We should study nature's methods and keep nature's factory going 24 hours per day.

There is one worry you people here have and that is alkali. You are down on a low, flat plain only a few feet above sea level, where the water table is always high. We made a soil map of all of this region and made an alkali map. We found on a big area of this county, which is fine bean land, the finest in this alluvial delta at the present time, two per cent and over of alkali from two and one-half to three feet below the surface. Under present conditions, with the water table where it is, this alkali will be held in the lower levels and will not cause serious trouble, but it is there in large amounts and if conditions ever become favorable for the rising of the water table that alkali is very soluble and can do nothing else but come to the surface of the ground. If it comes up one foot more bean culture is gone. That is one thing that the soil auger brought out and chemical analysis verified the field observations. The alkali is here and the soils are highly charged with soluble salts, and under favorable conditions the water table can easily rise a foot, and if it does the land will go back until some relief is given. On this particular field I mentioned the chemical analysis showed very little alkali at the surface, but every foot we went below the surface the alkali increased until at four feet there was plenty of it. There is just enough there to be a material factor in getting maximum returns from this ground. Something ought to be done to relieve the situation. With the information we have at the present time, we feel pretty confident that condition can be relieved. These soils need drainage. I do not care what the surface conditions are. It is not the moisture now that is doing the damage, it is the moisture at other times of the year. The water table is down all right now, but it is when it is up higher that small amounts of salts are being unloaded year after year until the soils are becoming charged with alkali, and in a very few years they can accumulate a sufficient amount of alkali to prevent the growing of crops. A little overirrigation on lands higher up will carry the salts to the low lands and raise the water table. You need relief through a part of the year when there is surplus water. Soils should be kept in what we call optimum moisture content as much as possible. The open spaces in the soil should not be filled with water. The plant stops growing until the surplus water is removed.

I am confident from analysis of conditions that we are wasting at

least a hundred million of dollars a year in commercial fertilizers. Nine out of ten farmers do not know whether their lands need phosphorus or not. They have added commercial fertilizers because someone else told them to. We have been doing too much of that. We ought to ask nature. Farming should be considered a business and nature is what we are dealing with and we should analyze conditions ourselves and nature will tell us within three or four years just exactly what is needed to get maximum returns. Use a soil auger, analyze soil conditions, study soil methods, carry on a little series of plot experiments to see what the soil will respond to. Nature will tell us exactly whether she is going to respond to phosphates or nitrates. If not, keep them off and save money. We should add fertilizers according to the needs of the land. This is another factor in that 40 per cent deficiency. I am confident we can increase crop yields 30 to 40 per cent if we will just get down and analyze nature's conditions.

The farm bureau movement is your own movement absolutely. We are paid to give our time and energy to help you solve these problems. There is not a scientific thought that comes out that cannot be gotten to the farmers within a very short time.

I might say more about the underground conditions. Our alkali problem here is serious and we need to get concerted action. Tens of thousands of acres in the San Joaquin Valley have been absolutely destroyed and are worthless until they are reclaimed. The situation is also serious in parts of Kern and Tulare Counties. They have had three successive dry years in those regions. In normal times the rainfall is just sufficient to wash the excess salts down into the water table, cleansing the soil once a year, but now after three years of deficient rainfall when there has not been enough rain to carry the excess salts down they have accumulated on the surface. I saw as much as 20 acres in one orchard where every tree was killed, simply by the rise of a little excess alkali. This could have been avoided if the farmers had looked ahead and avoided that possibility. It is a mighty serious problem with those people. That problem is universal in this state. It is possible to organize a system of drainage whereby this condition can be relieved. Your soils here are of light texture, the water passes through them readily, and the normal rainfall is high enough to remove 90 per cent of the alkali in two or three years. Your problem is simple compared to what it is in most places. You need concerted action. One man cannot reclaim his farm successfully. It is just like killing the squirrels on a ten acre tract while there are thousands of acres around to stock it up again. It is not a success when worked that way. It needs to be a big, general plan worked out for the entire delta region. The good farms are going to benefit indirectly. You are limited by the success of your neighbors. This region is one of the finest and most fertile little areas in the country, but I am confident you can increase your returns 100 per cent by a system of cropping, drainage and proper handling of the soil.

MEETING OF CITRUS GROWERS

Proper methods of fumigating citrus trees for scale pests will be the topic at a meeting called by County Horticultural Commissioner H. J. Ryan of Los Angeles County at the Covina Grammar School, Citrus Avenue, Covina, on Thursday, July 15, at 2:30 p. m. The gathering is to afford an opportunity for citrus growers, fumigators and expert investigators to discuss the best methods of obtaining results with the \$750,000 spent annually for the fumigation of citrus orchards in this county.

R. S. Woglum, entomologist of the United States department of agriculture, in charge of citrus fruit insect investigation work in Southern California for the United States bureau of entomology, will speak on "Recommendations for Fumigation Procedure," and it is expected will announce some of the results of his practical experimental work of the past season.

J. R. La Follette, foreman of pest control for the Leffingwell Rancho at Whittier, will talk on "Results of Three Years' Fumigation at the Leffingwell Rancho."

It Takes Water To Produce Milk

Leading farmers and dairy-men are using the

FULLER & JOHNSON FARM PUMP ENGINE

because they know that a continuous supply of fresh, pure water makes cows give more milk. They have found that they can depend upon the Fuller & Johnson Farm Pump Engine every day in the year.

This engine comes complete, fits any pump and on any well platform.

Our free booklet No. 17-A gives valuable facts on farm water supply.

Write for it today.

The Miskin Scraper

IS
THE BEST SCRAPER ON EARTH

And we can prove it. Write for circulars

The above is a cut of the Famous Miskin Scraper, which in operation, easy draft, greater capacity, and better work has many advantages over the common Fresno and wheel scrapers now on the market.

Made in 2-horse, 3-horse and 4-horse sizes. The four horse size can be operated by small tractors from the tractor seat, by the tractor driver.

Send for descriptive circulars, with prices. We pay the freight.

Miskin Scraper Works, Ucon, Idaho

Swarming and Its Control

By Geo. W. Price

THE normal colony of bees in the spring consists of a queen and several thousand workers. As the young bees begin to emerge the quantity of brood is increased and it gradually keeps on increasing as the bees bring in more nectar and pollen. Soon the hive is nearly full of bees and brood. The queen then starts to lay in the drone cells. The colony keeps on increasing until it is too large for one hive. The bees then begin to build queen cells. A queen cell is different from other cells in that it is larger and hangs on the comb vertically. The same egg that produces a worker could produce a queen. The queen larvae receive special food, however, and that is what makes the difference. When the larvae are grown to full size they are sealed up. The colony is then ready to swarm, and at a favorable time the old queen and most of the bees leave for new quarters.

Bad weather during the swarming season may stop swarming, as bees will not swarm unless the weather is nice. It is very seldom, however, that there is much bad weather at swarming time.

The swarm, on leaving the hive, circles around in the air a few minutes and then clusters a short distance away. There it remains for a short time before flying away to the new home. They seldom get a chance to go farther, however.

If increase is not desired, the swarm may be returned, without the queen, to the old hive and all the queen cells destroyed excepting one good one.

When increase is desired the old hive should be moved to one side and the swarm hived in a new hive on the old stand. This forces the field bees of the parent colony to join the swarm. The supers on the old hive should be removed and placed on the new one. It is a good plan to destroy all queen cells but one in the parent colony, or else destroy them all and requeen. Otherwise the colony may cast another swarm.

Swarms should be hived on full sheets of foundation rather than drawn comb. Then the honey brought in is stored in the supers, just where it is wanted. As the foundation is drawn out in the brood chamber, the queen occupies every cell as soon as it is built, so there is no honey stored there for some time. Of course there is not much brood reared, but it is not needed at this time.

Many of the best beekeepers clip one wing of each of their queens. Where this is done the swarm issues just the same, but the queen, being unable to fly, flutters around on the ground in front of the hive. The swarm goes a short distance, but upon discovering that the queen is not present, returns to the hive.

While the swarm is gone, the queen is caught and caged, the old hive removed to a new location and a new one put in its place. When the swarm comes back and the bees start to enter the hive, the queen may be freed among them.

Where the old method of hiving swarms is used, it is a good plan to have some kind of a swarm catching device on a long pole to reach swarms that cluster up high. A bushel basket on a long pole will do.

In preventing swarming, much depends on whether the apiary is run for comb or extracted honey. It is much easier to prevent swarming when running for extracted honey. Then there is a big difference in colonies. Some colonies go through the season and never seem to think of swarming, while others seem determined to swarm no matter what is done to stop them. It may be necessary to dequeen this kind of colony. Dequeening will usually stop swarming when all else fails. It is not generally used, however, except as a last resort, because a queenless colony does not seem to work as well as one with a queen.

The season seems to have some effect on swarming. The bees would much rather work in frames than in comb honey sections so the extracted honey producer does not have as much trouble as the comb honey man. If he adds extra supers as fast as the

bees need them and gives plenty of shade and ventilation there will not be much swarming. Of course, the room should be provided just before the bees need it, and not withheld until they are crowded, or they may start queen cells.

Some beekeepers use the Quinsby hive which takes a frame 18½ by 11¼. The users of this hive claim that it gives the bees and queen so much room that they have very little desire to swarm. Anyone who tries this hive usually finds this true. Others use a two-story Langstroth brood chamber. This extra story should not be put on until the lower one is almost full of brood. It is a good plan to take a couple of frames of brood from below and put them in the upper story, putting frames of empty comb in their places. The queen goes above much more readily when this is done.

About a week before the honey flow begins the frames should be sorted, the sealed brood put in the upper story and the queen and the rest of the frames in the lower one. A queen excluder should be placed between the two stories. The brood hatching out in the upper story gives room for the first honey that comes in, and the queen usually has room enough to lay in the lower one.

In the production of comb honey it requires considerable skill to keep the colonies strong and busy in the supers, and prevent swarming at the same time. The small sections are unnatural and the bees sometimes sulk for a few days before beginning work in them. During this time queen cells may be started. It is a good plan to have a few sections that were not completed the year before and put two or three of these in the center of each super. The bees will start work in these partly drawn sections sooner than if the super contained only sections with foundation. Another plan is to put a shallow extracting frame full of comb on each side of the super. As soon as the first honey comes in the bees store it in the comb and then the work spreads to the sections.

Plenty of shade helps to prevent swarming. Of course natural shade is the best and quite a few apiaries are located in orchards. Where there is no natural shade it is a good plan to use shade boards made of rough lumber. These may be placed on top of the hives or at the side.

Ventilation also helps to prevent swarming. During the honey flow the entrance should be the full width of the hive and if the weather is very warm it is well to raise the hive from the bottom board with seven-eighth inch blocks at each corner.

A colony with a young queen seems much less inclined to swarm than one in which the queen is a year or more old. Many of the best beekeepers requeen with young queens just before swarming time. When this is done laying queens should always be given as brood rearing will be suspended for a time if virgins are used.

Manipulation of the supers so that there is no break in the work helps to prevent swarming and also stimulates storing. If only one super is given and no more added until it is completed, the bees will become crowded and may start cells. After work is well started in the first super another should be placed underneath it. When work is well begun in the second super and the honey flow promises to continue a third super may be given, placing it next to the brood chamber, the first super next, and the second one on top. Toward the end of the flow the supers added should be placed on top. Then the bees do not use them unless they need them. Otherwise a lot of sections might be left unfinished.

Probably the plan most used to prevent swarming is that of cutting out the queen cells. This necessitates going over the colonies every week or ten days. Where one has a great many colonies to care for, this makes considerable work so the plan is more adapted to the small beekeeper. The strong colonies should be looked over a little before the time they are expected to start cells. It is not necessary to look over the whole apiary, for if the strong colonies have not

started cells the medium and weak have not done so. If cells with eggs or young larvae are found, they should be crushed with the end of the finger or hive tool. It is not necessary to cut them clear out. When cells are found in the strong colonies, the whole apiary should be gone over and any cells crushed. In about a week or ten days the apiary is gone over again. Some colonies will be found to give up the notion of swarming after the cells have been killed once or twice, while others have no intention of doing so. Some other method, possibly dequeening, must be used on these latter.

Some effort has been made toward eliminating swarming by breeding from those colonies which show the least tendency to swarm. Many beekeepers, after years of careful selection, find that they have greatly reduced the percentage of swarms. Of course, they have not done away with swarming entirely, but it may be that some day a strain of non-swarming bees will be developed.

CALIFORNIA NATIVE LILIES

In the Garden Magazine for April H. E. Gilkey of the horticultural department, University of California, has the following notes on our native lilies:

"The lilies of Western America form an interesting and charming group. The majority thrive in our gardens, if stable manure is kept away from them. For barbaric splendor plant the Leopard lily (*L. pardalinum*) and the Humboldt lily. Their warmth of gold and copper and vermillion gives a dash of color and life to a shaded, somber hillside that is worth any effort. If you have a bit of canyon, plant them both.

"*Pardalinum* can be obtained in some deep vermillion and crimson shades that are extremely beautiful. It may be that one of these will some day prove to be the source of the big red lily the world is looking for. When ordering *L. Humboldtii* be sure to specify the variety *magnificum*, as it is a sure bloomer and a vigorous grower; the flower, heavily blotched with orange and vermillion over a gold background, is hardly so beautiful as the chaste, clear orange blossom of the type, but you are certain to have flowers when you plant it.

"Several of the Pacific Coast lilies excel any other group in the genus for grace, delicacy of coloring and exquisite fragrance. *L. washingtonianum*, the Redwood lily (*L. rubescens*) and *L. Parryi* are a beautiful trio of shade lovers. Give them plenty of leaf mold and good drainage, but give them lots of water, too. All three are deliciously fragrant. *Lilium Parryi* may well rank as one of the sweetest of all flowers.

"The Washington lily and the Redwood lily are tall growers with regular whorls of leaves arising at uniform intervals along the stalks. Both are trumpet shaped, opening white or pinkish and fading to a wine purple with age. The latter has segments recurving more closely at the tips, and fades to a deeper wine color. The Mountain Lemon lily (*L. Parryi*), is more rare, shorter, and does not bear a great number of flowers like the others. It is a true trumpet shape, and in color a beautiful glowing lemon, often unsullied by a single tinge of foreign color, and yet again faintly spotted with brown.

"Other California lilies worth mentioning are *L. parvum*, from the Sierras, with tubular erect flowers in orange or yellow, and *L. Roezlii*, a good yellow Turk's cap. The long lost *L. Kelloggii* is a gem, like a miniature Leopard lily, but with a ground color of bluish white dotted lightly with crimson. I have seen it but once, but I shall always remember it as among the daintiest flowers."

CALIFORNIA ROSES

In the advertisement of one of the largest plant establishments in the United States we note an offer of four new roses produced in California—Los Angeles, Mrs. S. K. Rindge, Miss Lolita Armour, and William F. Dreer. Of these the first named was first introduced and is therefore least in price. But a footnote to the advertisement offers "One each of this set of four California introductions for \$14." California products bring the top prices.

ANNOUNCES COST OF PRODUCING WHEAT

The cost of producing wheat of the 1919 crop was as low as one dollar a bushel on just two farms out of 481 included in a cost of production study just completed by the United States department of agriculture. On 20 farms it was \$5 or over. The bulk of the farms produced wheat at a cost somewhat less than midway between these two extremes. The average cost per bushel for all farms was \$2.15. At such price half the farmers in question would have lost money on their wheat.

Fourteen representative districts in the Wheat Belt were visited by the field men of the office of farm management in making this investigation, a preliminary report of which has just been issued. Nine winter wheat areas were surveyed in Kansas, Nebraska and Missouri, and five spring wheat areas in Minnesota, North Dakota and South Dakota. For winter wheat 284 records were taken, for spring wheat 197.

Winter Wheat \$1 to \$8.20

In the winter wheat areas costs ranged from \$1 a bushel for two farms to \$8.20 on one farm. The average cost was \$1.87. If the price received had been \$1.87 more than half of these winter wheat growers would have produced wheat at a loss.

In the spring wheat areas the aver-

age cost was much higher, \$2.65, the range running from \$1.10 for one farm to \$5 or over for 17 farms. If the price received had equaled the average cost, between 50 and 55 per cent of these spring wheat growers would have failed to break even.

Yields averaged 14.9 bushels per acre for the winter wheat farms and 8.4 bushels for the spring wheat farms, and the cost per acre, \$27.80, for winter wheat as against \$22.40 for spring wheat.

"Necessary Price" Considerably Above Average Cost

Department specialists in cost of production studies point out in this connection that for the farms covered in this investigation the so-called "necessary price"—that is, the price necessary to give the producer a fair degree of certainty of making a profit, would be found at a level considerably above that of the average cost of production. For example, to allow a profit on 80 per cent of the wheat produced on the farms covered by this study the price would have to be about \$2.60 as compared with an average cost of \$2.15. At a price covering the average cost plus ten per cent, 75 per cent of the crop would be covered, but 40 per cent of the growers would still fail to break even.

Mexican cotton pickers are arriving in Imperial Valley cotton fields.

NEW PUMPING PLANT AT CUCAMONGA

A new pumping plant producing 675 gallons of water per minute has just completed the necessary tests for John B. La Fourcade who is the largest raisin producer in the Pomona Valley. The plant is located near Cucamonga at the owner's raisin packing house. Considerable interest attaches to this pump in that it is declared to be the deepest pump installed west of Texas lifting such a great quantity of water. The pump is lifting the water 470 feet which was unheard of up to within a few years ago. In the past the cost of raising water from such a depth has been prohibitive, but this water is being delivered on the land at a cost per inch which is much less than most water companies are charging today. In order to support the enormous weight imposed upon the pump head by the lifting of this 470 foot column of water a heavy duty equalizing ball thrust has been installed. This pump by its successful operation has demonstrated that it is possible to raise water economically from great depths, making possible the irrigation of land which up to the present time has laid virgin. A 125 horse power motor delivers the power by belt through the pump head. The pump is of the turbine centrifugal type.

FAIRBANKS SCALES

Don't Guess at Your Farm Profits

MANY A FARMER is losing money every year without knowing it through "estimating" the weights of his stock and produce, or through accepting the buyer's weights.

A Fairbanks Scale for Wagon and Stock use will give you the *exact facts* about your farm weights.

These scales have been doing just this for ninety years.

Weigh your feed to check results. Know your weights when you sell *anything* your farm produces. This is the only safe way.

Fairbanks Scales for Wagon and Stock use are designed and built to stand up under the day-after-day service your farm needs call for. They are built by experienced scale-makers who know farm conditions.

IMMIGRATION OF JAPANESE

(Continued from Page 38.)

published some matter from me on the Japanese question, to which you replied.

In my communication commenting on an editorial in the Los Angeles Times, I said: "The Times says that in spite of the gentlemen's agreement the Japanese come in here by tens of thousands yearly — where does the Times get that stuff? Certainly not from the official records of the federal immigration service."

To this you replied: "If Mr. Irish had read The California Cultivator of October 25, 1919 he would have seen there a statement given to the federal senate by Commissioner of Immigration Caminetti and signed by John W. Abercomble, assistant secretary of labor, that during the 12 months ending June 30, 1919, the agents of the federal government apprehended 9,678 Japanese who were in the country illegally and secured their deportation. This we followed by this bit of pertinent comment by McClatchy of the Sacramento Bee: 'Those figures refer to the ones caught and convicted. It is fair to assume that at least an equal number escaped detection and were added to the constantly

swelling Japanese population of the Pacific states.'"

Now the above matter has done duty as foundation of the charge that is repeated by the board of control and all the anti-Japanese agitators who are stampeding the people by lying. I secured a letter from the commissioner of immigration denouncing the statement as false. This I published, properly charging Mr. McClatchy with endorsing a lie, quoting your publication of his "pertinent comment."

To this Mr. McClatchy replies in the Stockton Independent of June 21 that he never made the "pertinent comment" you quoted and defies anyone to find it in the Bee.

Mr. McClatchy then adds this: "As a matter of fact the Cultivator has misquoted the Abercomble statement, which will be found at page 7 of the hearing before the senate committee, and is to the effect that during 11 years ending June 30, 1919, a total of 4,869 aliens who entered the country without inspection were apprehended and deported."

Now, sir, you have published what is proven to be untrue, and to strengthen it have quoted Mr. McClatchy in a "pertinent comment" that he never made. What are you going to do about it?

* * *

We are going to do as we have done above, acknowledge the error and make correction and publish the above which carries the statement as to immigration as it should have been made. At the same time we are going to appeal to Colonel Irish and to everyone discussing this subject to handle it in a way so as to create a friendlier feeling between the two races and less of race hatred and prejudice. The Japanese themselves would not tolerate a condition in their own country which they are asking Americans to be content with in this country.

As a model in convincing argument and as a plain and patriotic statement

we commend the communication written for Cultivator readers at the request of the editor by Senator Phelan. This statement appears in box on this page.

Certain it is the sane reasoning which must ultimately decide this question is not advanced by circulars such as "The Anti-Japanese Pogrom" by Col. John P. Irish. This circular abounds in such expressions as "Lie in both versions," "falsehoods," "correct the lie," "stampede the state by lying" and other similar expressions.

The Cantaloupe Season

THE opening of the 1920 cantaloupe season finds higher prices prevailing than ever before; a threatening shortage of cars, especially of the improved refrigerator type; a planted area exceeding that of last season by more than 7,000 acres; and the Imperial Valley section of California leading all rivals in early shipments.

Crop conditions, generally speaking, are reported to be good in the early shipping sections of the West, and the quality of melons appears to be excellent. Growers in the Imperial Valley are meeting the car shortage by allotment of available cars according to acreage. Reports are to the effect that this system has so far produced good results and that the crop probably will be moved without great loss, as the weather seems to favor a prolonged shipping season.

West Increases Acreage

The story of the early cantaloupe market in recent years has been largely the story of the Imperial Valley, for this section has the early market practically to itself. Shipments from the valley have increased rapidly in recent years, far exceeding any other cantaloupe growing district. Last season carlots of this stock were sent to 200 cities, not including many local diversions. The cities of Chicago, New York, Pittsburgh, and Los Angeles were the principal receiving centers, with a dozen other large cities receiving from 100 to 300 cars each. Distribution was liberal in the East and West, but generally lighter in the North. The short but active shipping season for the valley usually extends from the first week in May to the middle of July. This season, however, if the present weather conditions continue, shipping may extend into August.

During late years the center of cantaloupe production has been moving steadily westward. Having but one-fourth of the total acreage in 1915, California this year has nearly one-half. Arizona likewise increased its plantings 50 per cent during the same period and New Mexico increased its acreage from 500 to 5,270. Arkansas within the same length of time more than doubled its cantaloupe area.

The forecast of the United States bureau of crop estimates for cantaloupe acreage in 1920 was 70,820 acres compared with 62,365 acres in 1919, an increase of 13.6 per cent. Eleven states show an increase while six show a decrease. This gain of 7,000 acres in California was nearly equivalent to the total net gain in all commercial cantaloupe states.

Prices Open Higher

Prices for this season's Imperial Valley crop opened higher than in 1919. Sales to jobbers started at \$12 to \$15 for standard crates of 45's early in June, compared with \$6.50 and \$15 last year, but declined to a range of \$4.50 to \$6 by the middle of the month, the markets becoming generally firm at about that range. Sales at California shipping points began at \$2.80 to \$3.75, f. o. b., cash track, declining to \$2 and \$2.25, only to recover by the middle of the month to \$2.50 and \$2.75, with a strong market tone and growers reported holding for higher prices.

In 1919 California standard crates of 45's opened in producing sections at \$2.25 to \$3.50 early in June, declining by the middle of the month to \$1.50 to \$1.90, but afterwards showing a tendency to recover in part. Much of the crop was shipped unsold. The 1918 opening range was \$2.35 to \$3 and the low price reached for stock from the Turlock section late in August was 70 to 80 cents, wagonloads, trackside.

This circular opens with: "Let it be repeated that the present anti-Japanese agitation, like the anti-Chinese movement of years ago, has the same psychology as the Russian anti-Jewish pogrom, which always starts with the lie that Jews have murdered Christian children to use their blood in the rites of the synagogue."

We think Colonel Irish is going rather farther than his warmest Japanese supporter would ask in endeavoring to secure a truly patriotic settlement of this vexed question.

In 1917 the early price was \$1.25 to \$1.90 and the lowest figures were 60 cents to \$1.35, wagons, track side, September.

In connection with prices in 1919, it is interesting to note certain data compiled by the local field agent of the bureau of markets. Last season the production cost was estimated to be \$1.18 per crate on the average. The freight charge to Chicago was \$1.26 per hundred pounds and to New York \$1.56. Icing charges vary from \$2.50 to \$3.12 per hundred pounds. On the basis of these figures a jobbing price of \$3.40 per crate in New York and \$3.05 in Chicago would show a profit of ten cents per crate to the grower. The jobbing prices, however, exceeded these figures in most markets except in late June. Inferior grades sold for much less.

Gains in Carload Movement

Carlot shipments, like acreage, have shown a pronounced upward trend during recent years. In 1919 they reached the total of 21,954, an increase of approximately one-third over 1918, and of fully one-fourth over the average of 15,625 cars for the preceding five seasons. But gains in shipments were more irregular than gains in acreage because of unfavorable crop seasons or marketing conditions. Thus in 1917, with an acreage almost equal that of 1919, carlot shipments were only 12,627, compared with 21,954 in 1919.

Local reports indicate that a late, cold growing season in the Eastern states makes conditions seem somewhat unfavorable. In Georgia the crop was on June 1 reported officially as being 72 per cent of normal as compared with a 10-year average of 79 per cent. In Stanislaus and Merced Counties, California, from which cantaloupes enter the market after the crop of the Imperial Valley, the season is reported about ten days late, but the plants bloomed well and are in good condition.

UNIVERSITY TRAINED MEN ARE IN DEMAND

That the demand for men well trained in agriculture is greater than the supply is again illustrated by the experience of the department of horticulture of the University of Missouri during the month of May. During that one month it was asked to suggest men for professional positions in horticulture whose total yearly salaries would aggregate \$25,000; and this was in addition to a number of requests for men trained for practical positions. Not a man was available for a single one of these openings. Of course many of the positions demanded men with not only university training, but with more or less experience after graduation; but the demand, nevertheless, was for university-trained men. Temporarily industry may offer those of college age attractive wages, but every high school graduate should have brought to his attention the fact that further preparation in college or university still pays.

THE UNSIGHTLY INSANITARY MANURE PILE

The uncovered manure pile is a grave menace to the health of all who live within its influence, due principally to the well established fact that the common housefly deposits its eggs, feeds and reproduces its countless millions within the artificial incubator created by the unprotected open pile. It should be understood in this connection that insect life, notably flies and certain beetles, are attracted to the open manure pile, first through the odor, and second instinctively through the fact that the presence of heat will hatch their eggs and foster their developing young.

Government Stakes Moved

Some years ago I bought a ranch but did not live upon it for five years. When I moved there I found my neighbor had moved the government station stake about 350 feet over upon my land, claiming that he had a surveyor who found the government survey to be in error to that extent. How would you recommend taking the matter up?—Subscriber, Vista.

If you desire to have the boundaries of your land judicially ascertained it would doubtless be necessary for you to bring an action against your neighbor for ejectment from the land which he claims. In view of the circumstances he probably has paid taxes only upon that particular government subdivision which he claims, so that it would hardly appear that any adverse possession would enter into the matter. Your absence from the land would probably negative any idea of acquiescence in his action, but it would be well to take such action promptly, as otherwise he may acquire a definite right.

Eucalyptus Near Line

Can anything be done about a eucalyptus tree that has been planted two feet from the lot line and is injurious to our trees?—Subscriber, Burbank.

Upon showing the actual damage caused by the roots projecting into the soil of your land, you can bring an action to enjoin the owner of the tree from permitting its roots to extend into your land. This will, of course, from a practical standpoint necessitate his taking out the tree. You can, of course, dig a trench along the line of your property and cut off the roots projecting into your land without the necessity of any action.

Trespassing Stock

What can I do when a Durham bull of my neighbor insists on going through a five-wire fence at his pleasure? He comes into my pasture and does considerable damage.—Subscriber, Valley Springs.

See answer to "Cows Break Through Fence," Page 10, last week's Cultivator.

To Recover Title

Father bought a ranch several years ago. While in poor health he deeded it to his wife. The wife has now deeded it to a daughter. If any of the deeds are not recorded, can father do anything to hold the property either by homestead or other means? Does one actually have to reside on property in order to homestead it?—Subscriber, Sebastopol.

If the deed from the father to the wife is not recorded, then the father could doubtless deed the land to someone else, and if that deed was then first recorded it would convey title to the party mentioned therein. If the deed from the wife to the daughter is not recorded and the father is residing upon the property, he could doubtless file a declaration of homestead. In order to make this valid it is necessary that the person making the homestead reside upon the premises at the time homestead is made and claim the premises as a homestead. Sometimes the duration of the residence has been very short. It might be that other circumstances would enable the father to hold the property in some other way, but in such case it would be well for you to take the matter up with an attorney in your locality.

Joint Homestead

Prior to marriage I bought desert land. Since then, by the efforts of my wife and myself, this land has been improved so that it is now very valuable. I wish in case of my death to leave all to my wife. What steps must I take to carry this out? There are no children. Will a will be sufficient?—Subscriber, Holtville.

As to the land itself, if you and your wife execute a joint declaration of homestead, it would have the effect of conveying the real property to your wife upon your death, or in case of her death, then to you. This would not carry personal property upon the place, however; therefore, it would be best for you to also make a will in her favor. By taking both steps you would reduce the cost of administration of the estate. If the will alone is made the whole property would be subject to administration, while under the method stated, the real property would be subject only to a comparatively inexpensive procedure to declare of record the fact of the death of one of the parties.

Veterinary

Garget

Can you tell me what to do for garget in cow's bag? I have a valuable Holstein which has just freshened and she has garget in one quarter of her bag.—Subscriber, Buena Park.

Garget is often found in the udders of cows immediately after they freshen. In these cases it is usually due to a feverish condition of the udder caused by swelling and caking at the time of freshening. This can be successfully removed by applications of hot and cold cloths intermittently. Care should be taken not to get the cloths hot enough to burn the skin. This treatment should be given twice a day until the trouble has disappeared. In connection with this treatment, the udder should be massaged gently. A lubricant of some sort must be used with this treatment to prevent chafing of the skin. Sweet oil with a very small amount of turpentine is very good. Garget may also be caused by a specific organism which may be transmitted from one cow to another. The above treatment may also sometimes eliminate difficulty of this kind. If garget persists it would be well to consult a veterinarian who would no doubt be able to suggest a remedy for that particular case.—G. E. G.

Cow's Eye Affected

I have a cow that has one eye maturing away. Some think it is a rye beard. It looks as if proud flesh was eating it out. She rubs it some. It will water awhile and then it will get all over matter or pus and get dry and hard. The lids are a trifle swollen and where it is raw I can see a raised place like a small boil, but it does not open or look as if it would, but seems to be painful.—Subscriber, Dorris.

The action you mention is a little peculiar. Perhaps a rye, or barley beard may be in the eye as you suggest. It would be well for you to examine the eye as carefully as possible, in an attempt to discover some such trouble. If found, of course, it should be removed. This can best be done by the use of a pair of small forceps. In case nothing can be found I would suggest that you treat the eye with a five per cent solution of Argyrol. This can be dropped in the eye with a medicine dropper. See to it that the Argyrol is gotten into all parts of the eye and well under the lid. Drop this in twice a day. If the Argyrol does not get results you may substitute an Argyrol treatment about

every other day with a weak solution of iodine. You should, however, only get the iodine on the exterior parts of the eyelid, and not in against the eye. The safest way to apply this would be with a small brush. After the eye begins to improve you can limit your treatments to one application a day, or later on, even three times a week. The eye may also be washed out with boracic acid. This can be done quite often and in connection with the Argyrol treatment with good results.—G. E. G.

The Poplar farm bureau held a successful hog sale on June 25, the top car selling at \$15.

We are instructed by the owner to dispose of his high class Holstein dairy herd on the above date

POSITIVELY WITHOUT LIMIT OR RESERVE

Included are 40 head of young, well marked, big deep-bodied heavy producing cows. All Tuberculin Tested and as good a herd as can be found in the state. 30 head of splendid Holstein heifers, well grown all selected from the best producing cows in the herd. They are from 6 to 24 months old.

One 2 year old Holstein bull, well marked and a fine individual. Mr. Struve is an excellent judge of dairy cattle, and is offering an extra good lot of dairy cattle.

Mr. J. E. Leonard of Watsonville, is also selling 4 head of mares and 4 head of horses, weights 1150 to 1400 lbs. each, all good ages and sound. 4 sets of heavy leather harness and 2 sets of chain harness. Collars. No. 17 De Laval separator with 1¾ gas engine and vat, 5 h. p. De Laval boiler, cans, pails, etc.

TERMS—\$100 and under cash, over \$100 a credit of 6 months time with Bankable Note.

The Beginning of Cotton Growing in Arizona

By D. W. Working

Cotton growers of the Imperial Valley have been visiting cotton plantings in the Salt River Valley of Arizona. On June 24 and 25 they were shown over the Salt River Valley experiment farm and the Mesa experiment farm by Director D. W. Working of the Arizona college of agriculture. Dean Working writes to the Cultivator: "A good many people are not familiar with the fact that the first work with Egyptian cotton was done by the Arizona experiment station at that time under the supervision of my predecessor, Dr. R. H. Forbes." Following is text of Dean Working's address to the cotton growers at the Mesa farm:

HILE we are trying to realize the bigness of the Egyptian cotton industry in this valley it is interesting to consider its beginning 19 years ago. The twelfth annual report of the University of Arizona agricultural experiment station, giving account of work done during the year ended June 30, 1901, contains the following significant statement:

"During the present season several varieties of Egyptian cotton are being grown, varieties that are being grown in Egypt by irrigation and that are reputed to produce high grade cotton. At the end of the year (July 1) the crop is in excellent condition and gives promise of a good yield."

This seems to be the first reference in our publications to Egyptian cotton. As a matter of record, let it be said that the words just quoted were written by A. J. McClatchie, at that time agriculturist and horticulturist of the station. Let it be said also that the cotton was grown in this valley on the old farm on the north side.

The next reference to the new crop is found in Bulletin 41 which deals with irrigation at the station farm for the years 1898-1901, inclusive. This bulletin reports that Egyptian cotton was planted on March 30, 1901, after seven-tenths of a foot of water had been applied to the ground. The first irrigation after planting was on April 11, and the last on October 7. The cotton was irrigated 13 times and the depth of water applied during the growth of the crop was 4.3 feet. The cotton was picked December 14, the yield being at the rate of 400 pounds per acre. It is illuminating to learn that the crop was worth \$68 per acre; that it cost \$48 per acre to produce and market it, leaving a net value per acre of \$20. The net return per foot of water applied was \$4.05.

The thirteenth annual report of the agricultural experiment station contained the following statements by Professor McClatchie under the heading "Egyptian Cotton":

"The experiments with Egyptian cotton begun during the spring of 1901 are being continued, seed having been supplied by the United States department of agriculture for this purpose. The questions to be settled are what variety or varieties are best suited to our conditions, what is the best time to plant in our climate, at what distances apart should it be planted in our soils, how should it be irrigated, and what is the most economical method of harvesting it.

"The crop grown during 1901 was planted and irrigated according to directions given by Professor Foaden in Bulletin No. 42 of the office of experiment stations. The cotton was harvested during November, and, through the kindness of Director Stubbs, ginned at Audobon Park by the Louisiana experiment station roller gin. The yield per acre was as follows: Abbassi, seed cotton 1,580 pounds, lint 460 pounds; Mit-afi, seed cotton 1,150 pounds, lint 275 pounds; Jannovich, seed cotton 500 pounds.

"During the present year two varieties, Abbassi and Mit-afi, are being grown. Different plots of each variety were planted at different dates and at different distances apart. Other plots are being given different amounts of water, the remaining conditions being the same. Judging by the results thus far, the Abbassi would be the most profitable one to grow here, the time of planting should be about the middle of March, and the crop should receive a moderate amount of water with plenty of cultivation."

Other comments were made in later publications. Bulletin 48, dated June

10, 1904, states that "Most varieties of cotton can be successfully grown in this region * * *. Formerly the Pima Indians grew one of the short staple forms for clothing, and Egyptian cotton has been quite thoroughly tested at the station farm. If supplied with plenty of water it grows thriftily throughout the summer and produces a good crop of excellent cotton."

Bulletin No. 60, made up of a collection of timely hints for farmers, contains a discussion of cotton growing in Arizona by R. W. Clothier. This leaflet, written in 1908, refers to the experiments of Professor McClatchie in 1901 and 1902 and to experiments carried on at Yuma "since 1902" by the United States department of agriculture. It contains the following suggestive statements:

"The more recent experiments point strongly towards Egyptian cotton as best adapted to Arizona conditions. The climate of the Salt River and Colorado River Valleys is similar to that of Egypt. Both regions are irrigated and are distinguished by the long growing season so essential to the proper maturing of Egyptian varieties of cotton. Experimental cultures grown by Professor McClatchie in 1901, by methods resembling those in use in Egypt, gave results as follows:

"Abbassi, 1,580 pounds seed cotton per acre yielding 460 pounds lint; Mit-afi, 1,150 pounds seed cotton, yielding 275 pounds lint; Jannovich, 500 pounds seed cotton which was not ginned. Samples of Abbassi and Mit-afi were sent to the Lowell Textile School to be tested for quality and compared in this respect with imported Egyptian cotton. Arizona grown Mit-afi fiber was found to be 14 per cent stronger than Egyptian grown, while the waste was 15 per cent less. The maximum yield obtained on the poor soils of the station farm, in a heavily irrigated plot, was at the rate of 2,200 pounds of Mit-afi seed cotton per acre.

"Investigations carried on at Yuma since 1902 by the bureau of plant industry, U. S. D. A., confirm these first results as to the high quality of Arizona grown Egyptian cotton and further show that the length of the fiber has increased with acclimatization; likewise the yield."

NO CHANGES IN WHEAT GRADES

That no change should be made in the present federal standards for wheat is the decision of Secretary of Agriculture Meredith following hearings recently held in Washington and Chicago. The hearings were the result of representations made to the secretary that dissatisfaction existed in the Central Northwest with the present federal wheat grades for Hard Red Spring and Durum wheats. At the first hearing in Washington some producers from certain sections urged that changes be made to take effect at the beginning of the coming crop year, involving a distinct lowering of the standards for Hard Spring and Durum wheats. At this first hearing a delegation from the Central Northwest presented its views; at the second hearing in Washington a delegation of grain dealers and representatives of grain trade organizations from Texas, Oklahoma and Illinois were heard; and at the third hearing, held at Chicago, representatives of producers, the grain trade and millers discussed the proposed changes. All interests concerned in production, marketing and handling were heard on the proposals.

Lowering Standards Would Reduce Farmers' Returns

"The request made by the Central Northwest delegation for a general lowering of the present standards for Hard Red Spring wheat and Durum wheat," says the secretary in announcing his decision, "was made apparently on the theory that, under the standards they proposed, the producer would receive more money for his wheat. The arguments made in support of this theory were not convincing and were not supported by evidence. On the other hand, the testimony seemed to prove that, under

free and open competitive marketing conditions, the lowering of the present standards would tend to reduce the return to the farmer. The department's studies of grain marketing support the latter view."

BEAN SITUATION DISCUSSED

That relief for bean growers is in sight because of greatly reduced acreage and restoration of normal competition was the opinion of the speakers at the monthly luncheon of the agricultural bureau of the Sacramento chamber of commerce. J. V. Mendenhall told of the activities of the Bean Growers Association in attempts to secure passage of a protective tariff on beans which would enable the California growers to compete successfully with the cheap labor conditions in the Orient. Developments to date indicate a favorable outcome for the bill, Mendenhall stated. The conditions which have obtained in the bean market during the past few years have been due to a variety of causes, such as the cutting off of normal competition by government price fixing during the war period; overproduction; competition with cheap beans from the Orient; a much reduced demand on account of increased wages and consequent higher standards of living in the coal mining sections of the East; and the aversion of returned soldiers to this article of food. The acreage for 1920 in California planted to beans, except Limas, will probably be not more than 40 per cent of the 1919 acreage, and in this reduced production, accompanied by the restoration of normal marketing conditions and the elimination of Oriental competition by a protective tariff, is seen the salvation of the California bean industry.

MANY FARMERS GROWING SORGHUM

A marked increase in the production of sorghum syrup is indicated by reports received by the United States department of agriculture, which has been engaged in a special campaign to induce greater production of this crop because of the keen demand for sugar substitutes. At the beginning of the world war the annual yield of sorghum syrup in the United States was approximately 13,000,000 gallons. This has increased steadily until for the past year it was approximately 30,000,000 gallons. The average yield of syrup per acre has been about 100 gallons, but the fact that this figure can be increased is indicated by the department's experiments, in which more than 400 gallons per acre have been produced in some localities.

In urging increased plantings to sorghum the department's experts point out that despite the increasing yields the demand is still greater than the supply, as shown by the price for syrup, which has ranged from 90 cents to \$1.50 per gallon, and in a few cases even higher.

There are abundant opportunities for increasing the sorghum production, the experts say, since this crop can be grown in every state in the Union with the possible exception of Maine. In the Northern states it is necessary to plant early maturing varieties of sorghum. Early Amber and Folgers are among the varieties recommended by the department, which is prepared to supply inquirers with full information regarding the cultivation of this profitable plant.

SHOULD KNOW MARKET CONDITIONS

In addition to knowing the grade and staple of his cotton the cotton farmer must be fully informed regarding market conditions and must have proper outlets for his cotton if he is to secure its full commercial worth, say cotton specialists of the bureau of markets.

Every farmer offering cotton for sale ought to know the course of the futures market on the particular day; the course of the spot market in the city or cities to which his own market is tributary; the course of the spot market in other cities that are comparable to his own, and other special conditions that may affect the value of his cotton.

The bureau of markets is supplying a part of this information through its price quotation service. The cotton belt is divided into five districts, with headquarters at Charlotte, Memphis,

New Orleans, Dallas and Atlanta, and from each of the four first named points a bulletin is issued on Monday of each week, giving disinterested and trustworthy information as to the course of prices and market conditions. As soon as available men can be secured, similar bulletins will be issued also from Atlanta. Any farmer requesting this service will receive free of charge the bulletins issued from the headquarters of the district in which he resides. As prices vary from day to day and from hour to hour, farmers may make arrangements to secure by telegraph any information contained in the bulletins.

DISEASE RUINS PHILIPPINE CORN

Uncle Sam's little brown nephews on the Island of Bohol, P. I., are in serious straits for food, the downy mildew having ruined their corn crop. W. H. Weston Jr. of the United States bureau of plant industry recently returned from a two year trip in the islands, where he studied the disease. He reports that the damage done in the southern islands of the group is particularly disastrous and that the natives are at times reduced to eating the pith of the burri palm, which constitutes an emergency ration when the other crops fail.

The islands produce an annual corn crop valued at \$8,820,000. Corn is the second most important crop in point of area planted; it is estimated to be about third in value. The islands do not produce enough of their principal foodstuff, rice, to supply their own uses, and the natives are forced to produce corn and to import rice from California and from Oriental countries. When the downy mildew, *sclerospora philippinensis*, finds crop conditions favorable the result is an acute situation in the food problem of the natives.

The bureau of plant industry has made a thorough study of the disease, and its life history is known. Preventive methods have been developed which have been successful in con-

trolling the disease, even where conditions were worst. There is no reason known why the mildew would not flourish in the southern part of the corn belt in this country if it once obtained a foothold. Every resource of the department of agriculture is directed toward the prevention of such an invasion, however, and the Philippine corn is under a quarantine imposed by the federal horticultural board.

PUBLICITY AN AID IN LAW ENFORCEMENT

By R. H. Taylor

We are impressed with the vital importance of our California laws, not only those that aim to promote the present welfare of the state, but as well those that safeguard future agriculture against the hour of need. The laws as they exist today on our statute books were enacted with the full and complete understanding that they were to be enforced. To secure the adequate enforcement of any given law requires, as a primal essential, the support to be had only by activating favorable public sentiment, and such sentiment may be promoted largely through an understandable interpretation of the needs, purposes, aims and advantages of the laws as written.

There are a number of most excellent laws having direct bearing upon the future prosperity of the state by protecting its chief industry, agriculture. But to secure the maximum benefits from these well intentioned laws it is necessary that the individual farmer analyze these measures and satisfy himself as to the good to be had through their careful and thorough administration at the present time.

The state should receive from every farmer a hearty compliance with the laws of the state, even though at times they may appear to work local hardships. Although it may affect an individual adversely at times, it may be a distinct advantage to him at the

next turn, and in the aggregate the greatest good to the greatest number will ultimately work benefit to all alike.

This applies particularly to the agricultural and horticultural laws of California. The state and county officials charged with the enforcement of these laws are anxious for the opportunity to explain the purposes and execution of the laws to everyone who will listen. When in doubt as to the full meaning and intent of a given regulation do not hesitate to call on your county horticultural commissioner, district veterinarian, dairy inspector or on any of the officials in the state department of agriculture, and you will be surprised how glad they are to help in an explanation of the several laws and their benefits to all concerned.

These laws were enacted to protect the California farmer, dairyman, fruit grower and cattle raiser, and with a harmonious understanding between the state and county officers and the individual it follows that lasting good will result to everyone.

WATER HYACINTH IN CALIFORNIA

Ethelbert Johnson of the California department of agriculture has been investigating the water hyacinth situation in the state and reports:

"An interesting sequel to an article in the March Monthly Bulletin was the information from a number of reliable sources that the water hyacinth already was established in California. Investigation by the California department of agriculture, with the assistance of Commissioner Fred P. Roulard, disclosed an infestation of the pest in the Centerville bottoms in Fresno County, located in such a situation that in a season of floods it could be readily carried into the Kings River.

"The question arises, How did it get there? The only plausible theory is that it was either deliberately plant-

CORDS CAREFULLY BUILT

If we were asked to name the one point of greatest superiority which marks Mohawk Cords above other tires, we would name "Care that Goes In to Their Making."

Careful work was the solid foundation on which the Mohawk Rubber Company was organized seven years ago and on which it has grown to a position among the leading tire companies of the country.

This dominating principle has been maintained in the selection of materials and in the building of all Mohawk Tires—both Cord and Fabric—and Mohawk Tubes. We have adhered strictly to the policy of using only pure rubber and the best of fabric obtainable, plus the necessary compounding materials, in spite of the alluring cost-cutting possibilities of the thousand of substitutes which are to-day common in the tire business.

Mohawk tires are built by hand because that is the more careful way.

Mohawk Cords range in size from 30 x 3 1/2 for Fords to the 40 x 8 pneumatic for trucks. You will find that Mohawk Cords weigh more than the average cord tire—as much as 8 to 10 pounds in the larger sizes.

MORE PORK IN LESS TIME

Duroc-Jersey hogs have a tendency to put on great amounts of pork at an early age. They are easy-feeding animals, and raise large families. These hogs were introduced less than 50 years ago, and yet in 1918, 51% of all the hogs marketed in the country were "Duroc-Jerseys." They are uniformly red in color. Increase your profits by raising Duroc-Jersey hogs.

Write for "DUROC-JERSEY HOGS ARE PROLIFIC AND PROFITABLE"—sent free to hog-raisers by the largest swine record association in the world. Over 12,000 members. The National Duroc-Jersey Record Association. Dept. 130 Peoria, Ill.

COME TO THE

Great Dispersal Sale of Lamb's Durocs, at Ceres, Cal. Wednesday, July 21st, 1920

Offering is sired by such boars as Pathfinder, Orion Model, Orion Model Jr., Orion Cherry Pathfinder, Orion's King Gano, Lord's Orion Cherry King and Grand Wonder. Thirty sows and gilts bred to Orion Cherry Pathfinder, the big grandson of Pathfinder and Orion Cherry King Jr., Lord's Orion Cherry King, First Prize senior yearling at Sacramento last year, and Donald Orion Gano, a good son of the great boar Orion's King Gano. About forty open sows and gilts and ten boars complete the offering. Catalogues out in a few days.

ELMER LAMB
CERES, CAL.

Berylwood Registered Durocs

The Big Nebraska-Bred Senior Yearling Boar
Rancho's Kings's Col. Orion 286401

at head of our select herd of registered brood sows. This boar is from the famous Putman herd of Nebraska. His sire is King Orion by The King (Ira Jackson), dam King's Pride by King's Col. (R. J. Harding). He carries a combination of the best blood lines of the breed, and he is of the type in demand by leading hog men of the day.

Some of Our Leading Brood Sows

Daughters of P. & L.'s Defender by old Defender, Grand Golden Model by Grand Model, and Cherry Volunteer 2d, grand champion at Riverside, 1918.

—YOUNG BOARS READY FOR SERVICE—

We invite inspection of a number of good husky young boars got by such sires as

Great Model, Golden Model and Ireland's Joe Orion

These boars are about 7 months old, ready for service, and pedigrees go with every pig.

Spring litters all sired by herd boar. Write us for further information or call at the ranch.

Berylwood Investment Co.

J. W. Snodgrass, Mgr.

Hueneme, Cal.

A-1 Duroc Ranch

Where one of the state's greatest herds of Duroc-Jerseys is maintained. For years our Durocs have proven profitable to farmer and breeder alike. Better place your order now for spring pigs as what we will be able to spare will go quickly. Remember, this is the home of the state's highest priced (\$1500) and most valuable Duroc-Jersey sow.

J. P. Walker, RFD 1, Box 40½, Visalia, Cal.

Sows and Gilts---GET ONE

Bred to farrow next two months. We are making an extremely low price on these to reduce our herd. At the price we won't keep them long. Write today. Quick, before they are all gone.

H. P. Slocum, Willows, Cal.

The Greatest Duroc Boar of His Age! Choice Wonder 3d

a winner at the 1919 Iowa State fair, sired by the great boar, Mahaska Wonder, and a litter mate to the first prize junior boar of Iowa, heads our herd. He is the largest, heaviest boned, best footed boar in the state and he is being mated to the sows that have made this herd famous for futurity winners. Get your order in early for his pigs. Prices are most moderate. Satisfaction guaranteed.

The Fairbanks Ranch Hampshires at Redlands carry the limit in bone, stretch, feeding and producing quality. A. E. Harvey has laid down the law from the very outset that the herd must combine and maintain these vital points toward the making of economical pork producers. And it is the blood of the grand champions that is doing the work.

Visitors at Ortega Underhill Rancho, Santa Barbara, are delighted to see a reserve string of young Hampshire sows that are to feature a bred sow sale next February. Never were there finer litters at the ranch than now. They are bred in the purple and speak for themselves. Manager Tom Dinsmore takes pleasure in showing you around.

Gordon & Langdon's Llano Vista Ranch at Perris is headquarters for the best in Hampshires at all times. This herd has a splendid producing record, one year after another, and this year is no exception. They have the "belted beauties" in numbers to accommodate all comers, and these litters carry the best blood of the breed. You'll like the Langdon "Hamps."

F. B. Lewis, Pomona, has the foundation for a good business herd of Durocs. The boar in service is the two year old Pathfinder Imperial 274445, a grandson of old Pathfinder. Other blood lines in herd are Ohio Chief, Rivera Col. and California Great Wonder. Mr. Lewis has spent a couple of years at Davis and has the ambition and means to go to the front in the hog breeding game.

Russell Bros., home ranch at Triunfo, Ventura County, are leading breeders of Hereford cattle and Percheron horses in this state. They have extensive cattle interests in both Fresno and Monterey Counties, also in the vicinity of Owensmouth, Los Angeles County.

Fred Tice has charge of livestock interests at the noted Camarillo Ranch, Camarillo. This ranch acquired by purchase at the San Francisco livestock show last fall 30 head of registered Hereford cows. Since that date every cow has raised a calf. Some of the finest registered Belgian mares on the Coast are to be seen here. One of these tips the scale at 2,100 pounds. These mares are raising mules by an 1,150 pound mammoth jack from the noted Burrell Ranch at Hanford.

What are to be known as Tarzana Ranch Hampshires are now to be permanently located on the Burroughs Ranch on the Ventura Boulevard near Van Nuys. Mr. C. J. Gilbert has recently bought from the Conejo Ranch the great show sow Florene 2d, a daughter of The Young Senator. She won grand championship honors at the Los Angeles livestock show, also winning first prize in junior yearling class. The Tarzana people will likewise show a quartette of September gilts by Liberty, the noted son of The Harvester Again. To be shown with these gilts is the crack young boar by same sire and out of Maud, she by The Young Senator.

Geo. Waltmeyer at Conejo Ranch, Newbury Park, is busy these days lining things up for the big two day sale event, July 29 and 30. The sale is to

be held in the open under the shade of two mammoth oak trees, with seating capacity for the entire countryside. The big noonday barbecue lunch will be served across the road, with accommodations for all comers.

Alex D. McCarty, Modesto, recently purchased from W. A. Young, Lodi, the show sow, Black Beauty C, the 1919 reserve grand champion sow at Sacramento. He also purchased her spring litter and a yearling gilt out of the same sow. This purchase gives McCarty one of the strongest show herds in the state, especially in the sow classes. While McCarty had the grand champion sow last year, he has at least two sows this year that stand a better chance of winning than did last year's champion.

J. P. Walker, Visalia, is making plans for one of the greatest Duroc herds on the Coast. His intentions are to add a few of the best sows possible to obtain and is sparing neither time nor money to carry out his plans. He will not have much show stuff this year as he only expects to show the litter by Ace of Pathfinder and out of Orion Crimson Lady at the state fair.

A. J. Elliott, Tulare, has some of the largest pigs for their age in the state. Barring any bad luck, the man who beats Elliott will stand close to the head of the class at Sacramento this fall. The September litter by Hercules and a spring litter by Big Gerstdale Jones have unusual size and class for their age and would look good at any state fair in the country.

Hugh Shinn, Tulare, recently purchased a fall boar sired by Korver's Orange Wonder and out of a Goliath's Chief sow at the Korver Bros. sale at Alton, Iowa. This pig is an unusually well bred youngster and will be used to mate with daughters of "The Californian." He has sold three fall gilts by "The Californian" and bred to Hercules Jr. to a boys' pig club at Hollister.

Fred Gatewood, Fresno, is putting the finishing touches on Fresno Boy, the junior champion at the state fair last year. This boar will show in the senior yearling class and will be a hard boar to beat. He now stands about 40 inches tall and is very deep bodied.

Jack Borge of Dos Palos is fitting a very good bunch of Durocs for the state fair and expects to give the boys some little competition. His aged boar is California's Golden Model 3rd, a boar of excellent quality. Several of his get will also be shown.

Santa Anita Rancho, owned by Anita M. Baldwin, Santa Anita, has 33 registered Holstein cows and heifers on yearly test and some promising candidates for large records are being uncovered. All of these have been given seven day records as a starter, some of the recent ones including Anokia Gelsche Walker, a junior three year old daughter of Prince Gelsche Walker, 23.24 pounds butter in seven days; Anokia Beets Burke, a daughter of Merce Lad Korn-dyke Burke, 19.72 pounds butter in seven days as a junior two year old; Abbie Korndyke Segis, a mature daughter of Johanna McKinley Segis, 27.02 pounds butter in seven days; Alba Sadie Cornucopia Creeta, 28.84 pounds butter in seven days. This is the fifth seven day record for this great cow, her highest being over 36 pounds, and the five records averaging over 29 pounds. Sundrie Sunbeam Girl, the famous cow that dropped triplets on November 28, 1919, all of which are living and are strong, vigorous calves, is still milking over 80 pounds per day on yearly test and promises to make over 1,000 pounds butter this year. The \$41,000 bull, King Korndyke Pontiac Acme, purchased in the St. Paul National Sale for Santa Anita Rancho by Earl Sturgis, manager of the livestock department, reached the rancho in splendid condition and has already been placed in service.

One of the most important transactions in California Holstein circles was recently concluded with the in

corporation of Burr Farm, Los Angeles. In the new company the original owners, Messrs. Burr and Brown, have joined forces with Kenneth W. Abbott, formerly proprietor of Moorland Farm, Milpitas, who now owns a very substantial interest in the company. The Burr Farm herd is widely known as possibly the greatest collection of highly bred females of excellent type yet assembled on one farm in California in so short a time, and these females are headed by two bulls of outstanding merit, Sir Vee-man Korndyke Pontiac Korndyke, and the famous \$12,000 bull King Korndyke Pontiac 20th. A large number of excellent production records have already been made in this herd, and the policy will be to put every female on long time test as she freshens.

There was keen competition among owners of some of the greatest Holstein bulls in America for the next breeding of Tilly Alcartra. Her owners, A. W. Morris & Sons Corporation, Woodland, finally let their selection fall upon Sir Pietertje Ormsby Mercedes 43d, owned by Toyon Farm Association, San Francisco. As most everyone knows this bull is by Sir Pietertje Ormsby Mercedes and out of Aaggie Wayne Peep, the only cow in the world that has a greater five year butter production than Tilly Al-

Conejo Prince

Raised on Conejo Ranch, sired by Duke's Allen, dam Pine's Pride 4th.

cartra. Should the result of this mating be a bull, there will have been born a herd sire that has for his dam and sire's dam the two greatest long distance butter producers yet developed in any breed.

James J. Jeffries, Burbank, has a herd of registered Holsteins that won a great deal of favorable comment from the large number of breeders who visited the Jeffries ranch at the time of the recent C. W. Anderson sale. The herd is particularly impressive from the standpoint of good type, and the short and long time records now being made place the herd among the leaders in the state. The most sensational short time record lately made is that of Baron Annabel Lillib, with 38.28 pounds butter in seven days, which is the third largest seven day record ever made in California. One of the most pleasing records was recently made by a junior two year old daughter of Mr. Jeffries' famous herd sire King Segis Pontiac Jannek. This heifer made over 19 pounds butter in seven days, and at last report was milking right around 85 pounds per day and increasing. She is also a rare individual.

The daughters of King Pontiac Netherland Segis 3d, senior herd sire at Rosamaines Rancho, Stalder Bros., Riverside, are continuing at second freshenings the splendid records of production they made as two year olds. One of his junior three year old daughters now on test has 29.92 pounds butter to her credit for the first seven days and apparently has a good chance to cross the 30 pound mark.

The policy will be to put every female steins at Allana Farms, Dixon, will be sold at public auction on Thursday, September 23, with the possible exception of a few heifer calves. It was found necessary to hold this sale in order to dissolve the partnership existing between J. P. Phillips and his father, W. W. Phillips. About 40 head will be included in the sale, practically

every female with an official record and a number well along on yearly test, and all of breeding age in calf to a son of Sir Pietertje Ormsby Mercedes. The type, breeding and good health of this herd should prove attractive to prospective buyers. The sale will be managed by California Breeders Sales & Pedigree Co., Sacramento.

Rhoades & Rhoades announces for the owner, J. P. Struve, a sale of 70 head of Holsteins, all tuberculin tested, at the Struve Ranch near Watsonville Junction, for Saturday, July 17. This has been declared to be one of the finest offerings of dairy cattle. It is the closing out of the entire dairy business, and in addition to the fine young Holstein bull and the heavy producing cows there will be sold separators, gas engines and work horses.

BERYLWOOD REGISTERED DUROCS

The Berylwood Investment Co. at Hueneme, Ventura County, under the direction of J. W. Snodgrass as livestock superintendent, has launched an enterprise in the breeding of high class pure bred Holstein cattle and Duroc-Jersey swine that bids fair to take rank with the best of its kind in the state. The big new dairy barn is strictly up to date in its every equipment—white enamel walls, cork brick

floors, concrete floor in corral, litter carriers, and flyproof concrete manure pit. It also has a 250 ton capacity hay loft. There are sanitary hog barns and up to the minute poultry buildings. The living quarters for workmen are ideal, each man having a private room, with hot and cold water, large living room and shower bath. In this connection are introduced the Durocs. The boar at head of the herd is the big high backed senior yearling, Rancho's King's Col. Orion 286401. His blood lines trace direct to the best herds in Nebraska, Iowa and Ohio. The spring litters represent the get of this boar, and they are doing him credit as a sire of the up to date type, and strong litters at that. However, there are some very excellent boars and gilts of last fall's litters got by such noted sires as Great Model, Golden Model and Ireland's Joe Orion. At seven months these boars are scarcely to be excelled as herd boar prospects. They have the size, bone and stretch to meet the popular demand for economic pork producers. The brood sows at the ranch represent such sires as P. & L's Defender, Grand Golden Model and Cherry's Volunteer 2d. Four of the leading sows are Grand Lass 745082, Cherry Lady 745874, Defender Maid 738400 and Defender's Model Belle 732778.

COTTON IN EGYPT

In both Upper and Lower Egypt unfavorable weather delayed both the preparation of the land for cotton and the actual sowing, but on the whole conditions were not entirely unfavorable and the sowing is now practically completed.

In Lower Egypt cotton has been sown on a larger scale than last year, possibly exceeding the area by from 15 per cent to 20 per cent.

The increase seems to be confined to sakellaridis, although a new variety has been introduced, known as pilion. During the past two years the percentage of sakellaridis has been just under 73 per cent of the entire area planted, and practically all of the sakellaridis is grown in Lower Egypt.

Duroc-Jersey Bred Sow Sale

Winsor's Giant Orion

We sell a more uniform bunch of big type sows and gilts in this sale than will be found in any offering in the world with the exception of a very few of the top herds of the cornbelt. These sows are by Great Orion Sensation, the world's grand champion, Orion Sensation, his litter mate, Pathfinder, Great Model and Orion Fancy King.

Winsor's Giant Orion

The greatest proven big type sire in California..

The largest Duroc on the coast.

The largest O. C. K. boar in the world.

A son of the 1916 world's grand champion.

Great Sensation 3rd

The highest priced boar ever sold by a western breeder.

A son of Great Sensation and Uneeda Lady.

A half brother of Great Orion Sensation.

A sire of extreme size and stretch.

Sale Held at Los Angeles, July 28

What is Pasteurization?

By J. G. Jackley

PASTEURIZATION refers to a method of partial sterilization; and sterilization, as is well known, means complete destruction of all living organisms.

Historically, there are some very interesting incidents connected with the discovery of the procedure known as "pasteurization." A review of these developments will assist in an understanding of the principle and idea involved. The term "pasteurization" is inseparably linked and related to the theory of spontaneous generation and the science of bacteriology.

The theory of spontaneous generation was thoroughly believed in during the period of the dark ages and up until the middle of the last century. This theory was that all decomposition and decay in nature was due to the presence in the decaying bodies before the decay began of some destructive element which caused disintegration when the life spark departed. For example, when an animal or tree died decay began because there was present in the flesh or in the wood "something" which generated decay. It was well known that maggots developed when meat or other animal products were exposed for a short period of time. These maggots were said to have generated spontaneously in the meat. Early in the last century, however, scientific investigators found that by placing meat in a dish and covering it with a piece of cloth no maggots developed; the cloth screen of course prevented flies from coming in contact with the meat. This was a hard blow for the spontaneous generation theorists, but still they pointed to the fact that, while that same meat did not develop maggots, putrefaction did occur, causing offensive odors and finally complete disintegration of the product.

Scientific men, however, were not so easily satisfied. The high power microscope was being rapidly perfected, and these investigators found upon examining the fluid portion of decomposing meat that it was literally swarming with little rod shaped organisms that were moving. While these organisms could not be seen by the naked eye it was fair to assume that they were associated with this decomposition.

Finally in 1860 the chemist Pasteur placed bits of meat in a glass flask, inserted a piece of cotton in the neck of the flask and steamed the outfit. He found that this meat did not develop maggots, nor did it decompose. The steaming process had killed all the small microscopic organisms present; the cotton stopper in the neck of the flask prevented additional ones getting in from the outside air. Consequently it remained sterile. This experiment of Pasteur's decisively overthrew the spontaneous generation theory and marked the real beginning of the science of bacteriology. Many things have been learned about the small rod shaped organisms now called bacteria. It was found that they are constantly floating in the air in a more or less dried condition awaiting an opportunity to drop on to some nutritious food containing moisture and protein; that they multiply very rapidly—one organism in 24 hours under favorable conditions developing into millions; and that there are as many different species of bacteria as there are plants in nature.

There is still much scepticism and confusion regarding the relationship of pasteurization and bacteriology. In fact, there are people even today who refuse to admit that there are bacteria. Milk may be swarming with bacteria or water may be alive with these organisms and no one would suspect from the appearance of either that they were present. The story is told of a certain mountaineer in Tennessee who, when told about a giraffe with his long neck and when shown a picture of the aforesaid animal, insisted that it could not be possible. Finally he was taken to a zoological garden and shown a real giraffe, and he remarked, "Well, there ain't no sich animal, anyway." So, too, there are people today who, when told about bacteria, insist that "there ain't no sich things, anyway."

Bacteria are now classified as beneficial and harmful. The harmful bacteria are called disease producing or pathogenic. The popular belief is that all bacteria (germs) are harmful, which is a great mistake, since there are a hundred beneficial types to one harmful type. It would be as fair to say that because there are certain poisonous plants which cause poisoning and death all plants are poisonous. Generally speaking, as long as the animal or plant body is in a healthy, vigorous state, due to proper nutrition and favorable surroundings, there is little fear of bacterial attack. If, however, the vitality, resistance as it is generally called, of the plant or animal is reduced through unfavorable surroundings, such as excessively hot weather or cold, damp weather, insufficient or improper food, lack of water, and many other factors, they are then more likely to become the prey of bacterial parasites.

In the soil of the garden which is rich in humus there are vast numbers of bacteria that convert organic materials into nitrates, the basic food substance of practically all plants. In the rot nodules of leguminous plants, alfalfa, for example, there are swarms of bacteria that store up in these nodules nitrogen food for that particular plant, and when the plant finally dies and the root decays the soil is greatly enriched through the presence of this stored up material. It is because of this fact that alfalfa is said to rejuvenate or enrich the soil. If the specific nitrogen bacteria are lacking in any particular soil alfalfa will not grow. It is for this reason that new soil upon which alfalfa has never been grown must be inoculated with cultures in order to get the crop started.

The realm of agriculture is assisted on all sides by bacteria; they are made use of daily in the industries, but man is sometimes wholly unconscious of the fact that he is being aided by bacterial activities. In the making of cider vinegar a specific bacterium converts the alcohol of the cider to acetic acid. The fermentation process in sourknot and ensilage is brought about by a particular group of bacteria producing acid from the plant sugars. In the ripening of cream for the manufacture of butter a starter is used which consists of a pure culture of lactic acid bacteria. This organism, when growing in the cream, produces that delicate flavor and aroma which is peculiar to butter only. Oleomargarine manufacturers are now making use of this same organism in attempting to incorporate into their product the butter flavor by mixing a certain amount of milk, adding the bacterial starter, and permitting the mixture to ripen. Such oleomargarine is decidedly improved, losing much of the flat, grease like flavor of the unripened oleo.

Professor Pasteur of the famous Institute of Paris was one of the most active investigators in the subject of bacteriology in the years gone by. He found that while bacteria grew rapidly at room temperature, and especially at body temperature, most of them could be destroyed by a temperature of 140 to 150 degrees Fahrenheit, that is, all those bacteria that produce no spores (and most of the disease producing types of bacteria do not produce spores). He conceived the idea that this little secret might be used in safeguarding the milk supply of cities and towns. By heating milk to 140 or 145 degrees Fahrenheit for 20 to 30 minutes most of the bacteria are killed, including any disease producing types. This temperature does not affect the digestibility of the milk itself or impart a cooked flavor, as would boiling at 212 degrees Fahrenheit. Pasteur's idea was soon taken up all over the world, and in order to give the process which he devised a name it was called "pasteurization."

The question naturally arises — are there bacteria in the cow's udder? In the perfectly healthy cow there are none. Where then do the bacteria come from that are in milk? There are four chief sources: First, some fall in from the air, but these are of no great importance; second, a large number often get into milk because the milk pails and cans were only

rinsed after the last milking (not sterilized) and enough milk remained in the seams to be seething with bacteria by the next milking; third, small particles of fecal matter often are permitted to fall into the milk pail by the careless milker—such material is swarming with bacteria, a piece the size of a pea will carry millions of organisms; fourth, cows with diseased udders, mastitis or other specific disease, may give off living virulent bacteria that by all means should be excluded.

Proper pasteurization will destroy 95 to 98 per cent of the bacteria from the above sources, but that pasteurization must be done properly. If the milk is heated to too high a temperature it acquires a cooked taste and becomes less digestible. On the other hand, if it is not heated to 140 degrees Fahrenheit the bacteria are not killed and the consumer has a false sense of security. A high bacterial count indicates carelessness and dirt; it does not necessarily mean that disease-producing organisms are present, but often does.

Originally pasteurization was by the holding method only, the milk or other material to be pasteurized was placed in a receptacle, heated to the proper temperature and held there for 20 minutes. Commercial modifications of the idea have resulted in several methods:

First, there is what is known as the flash method where the milk enters a series of tubes that are surrounded by water of the proper temperature. The milk continues to pass from one end of the tube to the other in a continual stream. The temperature is run up to 175 degrees thereby shortening the holding period to about one minute. This method has the advantage of saving time for the milk plant but it interferes with the cream line when used for market milk.

Second, the holding method as practiced today usually consists in placing the milk in a large vat. Through the center of the vat is a large revolving coil which is heated by hot water. The agitation of the revolving coil mixes the milk and brings about a uniform temperature. The milk is held in the vat for 20 minutes. This method is perhaps the most generally used and is considered very satisfactory.

Third, there is the so-called package pasteurizing method where the milk is placed in the bottle, capped and then placed in a vat of water at the proper temperature and held. This method is very much more expensive due to the fact that it takes a great deal more space, more heat and is very much slower. It is considered, however, the ideal method.

Many people on the ranch pasteurize the milk which is to be fed to pigs and calves when it is known that the dairy herd has some tuberculous individuals. Where a steam boiler is available steam from the boiler is allowed to bubble into a can of milk by means of a hose. The milk is agitated by a paddle and then the temperature is determined by an ordinary household thermometer. When it is in the neighborhood of 150 degrees the steam is cut down to only a few bubbles a minute and thus the temperature can easily be maintained for the proper length of time.

The state dairy laws of California require that all milk or milk products be either pasteurized or from tuberculin tested cows. The law then goes on to outline how pasteurization shall be done. In addition to specifying a temperature of at least 140 degrees Fahrenheit for 25 minutes, it is prescribed that all pasteurization machines be equipped with self recording thermometers. Such a thermometer is a delicate piece of apparatus and expensive. However, authorities contend that since the proper temperature and the interval at which that temperature is maintained are so essential to proper pasteurization, the self-recording thermometer which automatically keeps a record of these facts is absolutely essential from the standpoint of inspection. Finally, the law requires that milk pasteurized for the retail trade be immediately cooled to a temperature of at least 50 degrees Fahrenheit. To cool a large volume of milk to this temperature a refrigerating plant is essential.

A pasteurizing outfit to handle the milk from 100 cows would cost in the neighborhood of 2,500. Thus it can easily be seen that the expense would make it prohibitive and impractical for

small dairymen. The cost of pasteurizing 100 pounds of milk is generally considered in the neighborhood of 20 to 25 cents, and where help is scarce this may soon become even greater. Some dairymen in this state have installed pasteurizing outfits when a large number of cows were known to be tuberculous in order to avoid a tuberculin test. Many of these pasteurizing plants on individual dairies have been abandoned after a year or two of trial and the owners have applied for a tuberculin test of their herds. Without doubt a clean herd of cows and selling the milk raw is more desirable and profitable in the long run.

THE LOUSY HOG

Did you ever notice a hog at this season of the year rubbing its shoulders against every fence post and wagon wheel in the lot? This may be a favorite pastime with some hogs but it is a necessity with others. It not infrequently indicates the presence of lice, the blood sucking parasite so common among hogs. During the warm sunny days these pests perform their acrobatic stunts on bristles about the hog's ears, neck, flanks and on the inside of the legs.

Just because this sort of louse is a small one do not think for a minute it causes little damage or annoyance. Hog raisers claim the loss of hundreds of dollars from this pest; first, through annoyance, and in the second place from unthriftiness of the animal.

When it is not possible to find a louse, hunt for the yellow eggs which are usually deposited on the bristles back of the neck. Treatment is quite simple. When it is not possible to resort to dipping, waste oils from tractors and automobiles have been found a cheap and effective remedy. There are many makes of oilers on the market. The chief object is to get oil on the louse or egg, since oil is destructive to both. Dip preparations do not always destroy the vitality of the egg.

An effective homemade oiler is made by wrapping a burlap sack about a post in the hog lot and keeping it well oiled. This serves as a scratcher and automatic oiler, or hogs may be crowded into close quarters and sprayed with oil. Or again, the kerosene emulsion, which is very effective as a louse destroyer, may be applied. Any efficient method will do so long as it is repeated often enough to kill the lice that hatch from time to time. —S. O. T.

MAKING PROFITS FROM SHEEP

Dr. A. C. Rosenberger of the state department of agriculture gives the following interesting information on profitable methods in the sheep business:

"Well bred stock and plenty of good feed pay in the sheep business. This year one of the sheep owners in San Joaquin County raised from 2,700 ewes some 3,300 lambs. Twenty-seven hundred, of which 900 were from the twin bunch, were good enough to be shipped to Chicago, bringing 14½ cents per pound at the loading corrals.

"The ewes were well bred Merinos and the rams used were Hampshires. The owner has an excellent range that grows an abundance of good feed, but during the lambing season plenty of alfalfa hay, corn and cottonseed cake is fed. He says he is repaid for the extra feed used by the increased poundage of wool alone, to say nothing of the added weight of the lambs."

TULARE COUNTY PREPARING FOR SHOW

That all the world may see, a huge electric sign bearing the words, "Tulare County Livestock and Agricultural Show," is being erected over the entrance to the fair grounds overlooking the state highway. The front wall will be remodeled in Spanish architecture, being finished in white stucco. A large main entrance 20 feet in width has been cut in the wall and will be brilliantly illuminated. The park between the highway and the fence of the grounds is being seeded in grass, and date palms are being planted. The fair will be held in Tulare September 14-18 and is officially known as "Tulare County Livestock and Agricultural Show."

Hemet Valley of Riverside County reports barley and wheat crops running 25 per cent over last year's.

DE LAVAL MILKER

at Roseland Dairy

Roseland, N. J.

Messrs. Henry Becker & Son,
the owners, write as follows:

The De Laval Separator Co.,
165 Broadway,
New York City.

Gentlemen:

Having now used a six unit De Laval Milker for nearly four years on more than one hundred cows, we wish to say that we are very well satisfied with the working of this machine in every detail.

The cows all take kindly to the De Laval Milker, which fact of itself proves the operating of it is very gentle. With labor conditions the way they have been for the last three or four years, we would have to dispense with part of our cows had it not been for the De Laval Milker.

And we must say that the service you render De Laval users is prompt and effective.

Henry Becker & Son, Inc.

THE De Laval Milker is a tried and tested De Laval product. It is a distinctly different type of machine—the only milker having master control of pulsation speed, uniform milking at all times, Udder Pulsator, positive alternating action, and self adjusting teat-cups.

The De Laval is faster, more reliable, more sanitary than any other method of milking. Its action is gentle from the start—old cows that are hard to milk, heifers and high-strung pure-breds are all milked successfully.

The De Laval Milker is made and sold by the same Company which for over forty years has earned an enviable reputation for service to users. When a man buys a De Laval product, the Company considers that its obligation to him has just started.

SAVE 25% Feed Chopped Hay

Ten Feed Tests conducted by the University of Idaho recently, have proved that 57.5 tons of chopped hay were equivalent in feeding value to 75 tons of long hay—a saving of 25%.

We will gladly furnish the complete results of these tests to dairymen and stockmen upon request.

You too can make this saving in your feed costs if you chop your hay—a saving of \$4 to \$6 on every ton you raise.

With a short hay crop in sight this is the way to start conserving it. Chopping avoids waste and utilizes to the fullest extent the feeding value of the entire hay crop.

THE FARMERS LIKE THEM

The liberal milking Shorthorn cow that also has meat on her back is a favorite with the farmer, and for the best of reasons. She pays her way and produces a calf that is always in demand. She quickly takes on flesh and is ready for market on short notice and her quality and extra weight bring an extra price to her owner. There is no other like her.

At the International Livestock Show two years ago a Shorthorn ewe was a prize winner in the class for milkers and her steer was champion in the beef steer class. It pays to breed Shorthorns.

ARIZONA HOG GROWERS FORM STATE ORGANIZATION

A number of progressive swine breeders recently held a meeting in Maricopa County and formed a temporary state swine growers' association.

The temporary officers elected were Ben J. Jeffers, president, and W. E. Schneider, secretary. The officers were further authorized to draw up a constitution and by-laws and to prepare a program of work for the coming year.

The most important problem confronting the breeders, according to the opinions of those present, is a more extended use of pure bred stock of good quality and the increasing of the dressing percentage of market hogs. Mr. Granville, who is managing a herd of 1,700 head of hogs, reported selling 74 head of nine months Duroc-Jersey hogs which averaged 272 pounds live weight and which dressed 78 per cent. This is in contrast with the usual run of hogs in Arizona which at present dress 65 per cent.

The question of establishing livestock sales in Arizona similar to those proving so successful in California through the county farm bureaus was thoroughly discussed and everyone was in favor of working toward this plan in Arizona. Mr. Schneider pro-

posed that a sale be conducted in connection with the coming state fair when a number of breeders could consign small numbers of hogs which would make a sufficient number to successfully hold an auction sale. Co-operative plans with the agricultural extension service of the University of Arizona were also discussed and the hog growers present expressed appreciation of the educational value of the pig club work and proposed that the newly formed association of hog growers give financial support to this work and that they assist in plans which might make possible a continuation and enlargement of the existing club exhibits as conducted during the state fair in years past.

It was also decided to make definite request of the proper officials for conducting hog feeding experiments on the Mesa experiment farm under the direction of the agricultural experiment station for the purpose of securing figures on the cost of producing pork under Arizona conditions, with the further idea of gaining any facts concerning the relative feeding value of barley, milo, hegar, feterita, in conjunction with tankage and alfalfa pasture.

A later meeting of the organization will be called when the program of work has been further developed and at this time a permanent state organization will be formed.

LOCO SERIOUS IN ARIZONA

As an experiment the Coleman Cattle Company in Navajo County, Arizona, will treat some of their locoed animals as recommended by the bureau of animal industry. This range is badly infested with loco and several hundred head of young cattle are affected.

County Agent Fillerup even reports that farmers claim their bees are becoming locoed.

Much loco extermination has been carried on by the stockmen. Many practical suggestions were made by Dr. C. D. Marsh, the government loco

expert, sent over the state this spring by the agricultural extension service to advise stockmen.

The report of injury from loco has been so serious in northern Arizona this year that Dr. R. J. Hight, state veterinarian, has joined in aiding the stockmen with this problem.

Many large bands of sheep are reported by County Agent Fillerup grazing safely over heavily infested locoranges. Occasionally, a hungry lamb will eat enough to be killed. Death comes more quickly with sheep than with cattle.

Upon a few ranges every horse has been killed by loco. This is true on some ranches in the Vernon district. The destructive species of the loco plant was in full bloom and most deadly about the last week in May or early in June.

A GREAT BULL

It is unquestionably true that up to the present time no California Holstein bull has attained any marked prominence through the presence of his sons at the head of a large number of good herds. Probably the nearest approach to fame in this respect has been made by Segis Pontiac De Kol Burke, whose sons acceptably head a number of high class herds, and it may

Food and Clothing for the Nation

be remarked in passing that they have proved to be uniformly good sires both as to transmitted type and production. The honors for sons at the head of high class herds at present belong to the great Burr Farm sire King Korn-dyke Pontiac 20th, and a large measure of the credit for this must go to his former owner, W. J. Higdon, Tulare. In the matter of having his sons handing down his blood through other good breeding herds, King Korn-dyke Pontiac 20th has already registered an achievement that seems worthy of note. Of course his outstanding son is King Korn-dyke Pontiac Acme, the bull for which Anita M. Baldwin paid \$41,000 at the St. Paul National Sale in a spirited bidding contest with some of the leading breeders of America. Then there is another son out of K. P. Tola Joe, for which Pecho Land & Stock Co., San Luis Obispo, paid \$5,000 when the calf was only four months old.

One of his most highly rated sons heads the Los Angeles County Farm herd, the dam being the famous producing and breeding cow De Kol of Valley Mead 2nd, whose yearly butter records at three and four years were a world's record for age when made, and she in turn the dam of Miss Valley Mead De Kol Walker, who is the dam of King Korn-dyke Pontiac 20th.

Another son out of the great heifer Madrigal Mooike 2nd is being used on several good Nevada herds, including the herd owned by University of Nevada, Reno.

Tosantos Walker Pontiac, another son, out of a 26 pound four year old full sister to Miss Gelsche Walker Korn-dyke, heads the good herd of pure bred owned by F. F. Pellissier, Whittier. The dam of this bull is generally rated as one of the best daughters of Prince Gelsche Walker and promises to establish a very large production record at mature age.

King Korn-dyke Pontiac Leda, another son, out of Leda Hengerveld De Kol Korn-dyke, a 30 pound daughter of Korn-dyke Quacen De Kol's Prince,

THE VICTORY HERD—Holsteins and Duroc-Jerseys

Holsteins of known value, headed by Sir Plebe De Kol Segis Pontiac, a son of King Segis Pontiac Count, acknowledged one of the breed's greatest sires. A young bull from this herd is bound to prove a profitable investment.

HILLCREST FARM, H. E. Spires, Mgr., Caruthers, Cal.
Duroc-Jersey Swine of Highest Quality

heads the Stockton State Hospital herd at Stockton. The dam is owned by Anderson & Fogarty, Sacramento, who will carry her on yearly test this year.

King Korndyke Paula Segis, another son, heads the herd of Allison & Storm, Tulare. The dam of this bull is Paula Segis, a 30 pound daughter of Sir Ormsby Burke Segis, and was one of the very best cows in the W. J. Higdon herd.

King Korndyke Senorita, another son, out of a dam that made over 700 pounds butter in one year as a three year old, heads the herd of A. W. Schultz, Burrel, and is one of the best individual sons of his sire.

King Pontiac Sarcastic Korndyke, another son, is owned by P. Brunold, Modesto. This fellow is a show bull, and his dam is a 22 pound daughter of Dutchland Hengerveld Sir Gladi. Her record was made at last freshening and she is rated capable of much larger production.

R. F. Guerin, Visalia, also owns a most promising young son of this sire out of the great 36 pound daughter of King of the Pontiacs, K. P. Tola, the dam by the way now being at Burr Farm, where she has started off wonderfully well on yearly test. There are also a number of other sons of King Korndyke Pontiac 20th in other herds.

BOTS

One of the most common insect pests of horse flesh is the bot. It is the larval form of the bot fly (*Gastrophilus equi*). It is about three-fourths of an inch in length, brown or whitish brown in color. The abdomen presents three rows of dark spots and the entire body is covered with hair.

The female fly busies herself during the warm summer days depositing and gluing her eggs on the hair of a horse. These yellowish seed like bodies are well sprinkled over the heavier haired parts of the horse. They are very small and ovoid in shape and placed in a standing position on the hair. Here the egg, which contains a relatively well developed larva, reposes until it comes in contact with moisture when it escapes from its resting place. This is occasioned by the animal licking itself or other animals infested with eggs and in this manner the grubs, as they are not infrequently called, find their way to the mouth and in turn to the stomach.

When this organ is reached the bot readily attaches itself to the mucous membranes by means of hooklets, of which it has many. The favorite location for these pests is near the outlet of the stomach. Here they remain until the following spring when their maximum size is reached. At this time their hold on the stomach wall is loosened and together with the food they pass through the intestines and are finally expelled with the excreta.

Once upon the ground they bury themselves in the litter and pass into the dormant or pupa stage. After a dormant period of from 30 to 40 days they appear as flies ready to start another life cycle.

During the warm season the flies are a source of great annoyance to horses. The harm done by the bot infested stomach depends on the number present, and the damage done may be inflicted in one of two ways. First, obstruction to the regular passage of food into the intestines, since the pest inhabits the stomach outlet. Such a condition delays the digestive functions and interferes with the normal nutrition of the animal. Second, the manner in which they attach themselves to the delicate stomach lining may cause injury, especially so if the grubs are present in such great numbers that crowding necessitates their taking a deeper hold.

There is no way of telling whether or not a living animal is injured by bots, since no typical symptoms are produced. Removal of bots from the stomach is a very unsatisfactory undertaking. Drugs do not affect the bot but may prove harmful to the stomach. Preventive measures as recommended by the division of animal industry of the state department of agriculture are much to be preferred to internal dousing. The first step in this direction is to see that the eggs do not gain entrance to the horse's mouth. The frequent use of the curry comb, card, or clippers is

to be recommended and prevention may be furthered by an occasional application of kerosene to pastured animals. This destroys the larvae and kills the egg laying flies. One part of kerosene to five parts of lard with the addition of a little pine tar makes an efficient mixture if applied about once a week during the egg laying season.

If you would use dope, use it externally, not internally.—S. O'T.

LEADING RECORDS OF CALIFORNIA COWS

Leading records in milk and butter fat made by the different dairy breed cows of California are contained in a 15 page circular for free distribution issued by the college of agriculture of the state university. Photographs of the prize cows are shown as follows: Interested Jap's Santa, record Jersey

cow; Belladia, record Guernsey cow; Aaggle Acme of Riverside, record Holstein cow; Willowmoor Vesta, record Ayrshire cow; Ruby Pietertje of Forest Hill, highest 30 day butter fat record and highest senior four year old seven day record. The bulletin, under the title "Advanced-Registry Testing of Dairy Cows," is the work of F. W. Woll, professor of animal nutrition, and P. I. Dougherty, instructor in animal husbandry.

AUCTION SALE

Conejo Ranch Pure Bred

Duroc-Jerseys & Hampshires

July 29th and July 30th

The first day of this big sale will be for Durocs exclusively — the second day the Hampshires will be offered. These real big types of both breeds in the Conejo Ranch Herds make valuable foundation stock for farmers, fancy breeders and pork producers.

Prize Winners at All Fairs

This is GIANT WONDER, one of our leading Duroc-Jersey herd boars. This big fellow's sire was Great Wonder and his dam Grand Lady 6th. This boar is an outstanding individual and his get will be seen at the Ranch. A great number of the gilts and sows in the sale are bred to him.

This is our Hampshire boar CONEJO PRINCE. This boar was raised on our own Ranch and was sired by our famous champion boar Duke's Allen and his dam was Pines Pride 4th. They go back to Manley's Duke and Walkover. If you want to see a big growthy type of Hampshire, this is one of them.

Make arrangements to attend. Lunch will be served at the ranch both days. If you desire transportation from Los Angeles to the Ranch, let us know and be sure to come to 404 Metropolitan Building, 5th and Broadway, when you arrive in the city. If you want a catalogue write us at once, and an illustrated catalogue will be mailed to you. Remember the days — July 29th for Duroc and July 30th for Hampshires—the famous pure bred stock of the Conejo Ranch.

JANSS INVESTMENT COMPANY, 404 Metropolitan Building, 5th and Broadway

the foundation of POULTRY PROFIT

lies in correct feeding and in giving poultry the elements which their system demands—whether it be for egg production or market use.

In LACTEIN CONDENSED BUTTERMILK, science and research have come to the aid of the poultryman with gratifying success. LACTEIN CONDENSED BUTTERMILK is pure, clean buttermilk, processed and pasteurized, with the added advantage of development of LACTIC ACID to the highest stage.

And with its most economical feeding, coupled with the wonderful results, LACTEIN should be the FIRST INVESTMENT YOU SHOULD MAKE if you are desirous of poultry profit.

LACTEIN is long past the experimental stage—the demand is great, and it taxes our factory to supply the great increase in its use. The largest poultry raisers in the world use it—and it pays them a handsome profit.

Ask your poultry supply dealer for LACTEIN TODAY — you'll find that it will put the profit in poultry.

Start now with this economically fed food and tonic for poultry and hogs—it keeps them in the finest of health and nourishment.

Poultry in Arizona

POULTRY prospects are somewhat brighter than they have been for several years. Those who are fairly well equipped for poultry work (that means, with good producing stock, fairly comfortable yards and houses), have done very well. Conditions on the whole, in spite of rather high feed prices, have been favorable.

Just at present there seem to be a number of factors that make the outlook particularly good. About 60 per cent of all the poultry in Arizona is in the Salt River Valley. Probably about one-third more eggs are imported into Maricopa County than are produced in the county. Of course this means that a much larger proportion is imported into the other sections. At certain seasons of the year there is a surplus and a considerable shipment of eggs to outside markets, principally to the mining towns of the state. Then during the winter season there is a shortage and it is necessary to bring in eggs from outside points. Other towns in the state ship in eggs practically the entire year round. Necessarily these are brought from outside the state, part of them from the Coast and part from Kansas City. Logically it would be desirable to produce enough for home consumption.

The overproduction in the spring of the year has been heretofore somewhat discouraging. For the past two seasons, however, there has been a quantity of eggs stored during the season, of greatest production. The results of this experiment have proved conclusively that storage is practicable and profitable. The fact that it is necessary to have only the choicest eggs to put in cold storage, has also had a noticeable effect on the improvement of the quality of the eggs. This has resulted in establishment of a standard of quality, one thing that was very badly needed. It has also resulted in putting a premium on eggs of first class quality, uniform in size and color.

We have now a modern fattening and killing plant for the handling of market poultry which insures a stable market for live poultry of all kinds at all times. This is encouraging. Another factor that is very pleasing to the poultrymen is the fact that the poultry division of the United States department of agriculture has established a poultry experiment station in the Salt River Valley. It is true that this station is only beginning and that not much benefit may be expected for a number of years but it is recognition of the climatic advantages that we have for poultry raising. Harry Lamon, head of this division who was here recently, states that it is his belief that this country has a wonderful future as a poultry raising center.

Our poultry breeders have found a ready market for a considerable number of their products in the northern part of the state where poultry raising is becoming more and more popular each year and is being encouraged very largely by the county agents in the northern counties.

The fact that we have green feed all the year round and that we are enabled to hatch early, makes it possible to raise earlier birds and birds that will begin laying as soon as cool weather comes in the fall and are in ideal condition for breeders the succeeding year. This gives us an advantage over eastern breeders which we have been somewhat slow to realize. Some of our breeders have had the courage to send their birds to some outside shows and have found that notwithstanding the trip of hundreds and even thousands of miles, they compete with birds of breeders of note throughout the United States. Our breeders are now coming to believe that there is an undeveloped field in this matter of producing breeding stock for the eastern markets which may have even greater possibilities in the production of eggs or market poultry.

Up-to-Date Cooperative Marketing

THE executive committee of the Poultry Producers of Southern California, Cornele G. Ross, chairman, sends out under date of June 25 a letter to members which will be a revelation to some of us, giving, as it does, an insight into business methods followed by that successful organization:

We hope every member will remember that it is only by the hearty cooperation of our shippers that we can achieve that success for which we are striving.

Use every possible care to keep your nests in a sanitary condition, in order that we may have clean eggs; gather twice daily, if possible; and store in a cool place—a place free from objectionable odors. Be careful in filling out your grade slips; see that all old tags are removed from your cases; be sure that each tag agrees with the contents of the case, and is securely attached to the end of same; and ship twice each week during the warm weather.

Your officers and station employees are not perfect, and may make mistakes, but we think our system is such as to keep these mistakes reduced to a minimum. For the information of our shippers, we give herewith the course each shipment takes after it reaches our hands:

The filled cases of eggs come into the station, either via truck, express, freight, or by personal delivery, and each shipment, as received, is entered in a book by the receiving clerk, who, at the same time, gives the shipment a register number and makes out a tally card. This tally card bears the register number, the date, the shipper's name, the number of cases in the shipment, how received, and, if delivery charges are collect, these too are noted on the card.

When received by truck (as most of the eggs are), the cards are first checked to agree with the truck driver's list, and all cards are checked as cases are unloaded and stacked on

the floor. The cards are then secured to one of the cases in the shipment, and when the head candler turns a shipment over to the individual candler, the card is again checked to see that the number of cases agrees with the number shown on the card.

The shipment then goes to the candler's bench, where he opens one case at a time, removes the grade slip with your record on it, and prepares to candle and grade the eggs. He may have before him, in addition to the filled case of eggs, from four to six cases partially filled with graded eggs from previous shipments, and he first sets down on the tally card the exact number of each grade of eggs in the cases before him. He then candles and grades into Extras, Firsts, Pullets, Dirties, Crax, etc., and also removes any "rots" or "leakers." When he finishes the entire shipment he again counts the eggs on his bench, together with any filled cases he may have removed, places the figures on the tally card, and strikes a balance which he then compares with the shipper's grade slips. If there be any discrepancy he calls the head candler's attention to same and signs the card. Should he at any time during the candling of a shipment find what he thinks to be a "shortage," such as an empty, or partly filled, filler, he calls the workman on either side of him to verify his count, and notifies the head candler immediately.

These tally cards, which now bear both the shipper's and the candler's grading, are compared with the shipper's grade slips by the head candler, and in case of any material discrepancy the office notifies the shipper immediately.

The cards for each week's pool then go to the office, where they are arranged in alphabetical order and transferred to the statements. The statements are made in duplicate, one copy to go to the shipper with the remittance, and the other for a permanent record in the office. Another record is made in the office register, which

has to agree with the statements. Checks in payment of all shipments received during the pool week are then drawn, and these must agree with the totals shown on the statements.

In addition to the foregoing proofs, our auditor makes a monthly audit of eggs received, eggs sold and eggs on hand. His written report covering this audit, together with his regular financial statement, is submitted to your board of directors each month.

As the filled cases of graded eggs leave the candling room, they go to the nailer's bench, where the tops are nailed in place, after which they go out in accordance with their grade and the orders in hand, either into storage (during the storage season), to the trade, or into cars for shipment. The ends of all cases bear our name and the grade of the eggs, these being stenciled on the cases when they are made up. At the peak of the season as many as 700 cases for each working day in the week have been moved into and out of the station, since, owing to the perishable nature of our product, it cannot be held on the floor.

Come in and see for yourselves just what your station is doing, and you will realize the efforts your officers are making to successfully handle your business.

LADY VICTORY LAYS LAVISHLY

Poultry specialists of the United States department of agriculture practice as well as preach. Their recommendations to poultrymen are based on actual experience. At the department's experiment farm at Beltsville, Maryland, is a flock of more than 6,000 birds whose thriving condition and good egg production are evidence of the practicability of the specialists' poultry doctrine. In this immense flock is one hen—Lady Victory they call her, though officially she is No. 408—who has been exhibited at many poultry shows and has taken many prizes. This is the enviable laying record which she has made: In her pullet year she laid 214 eggs, and in the first five years laid a total of 779 eggs. Lady Victory is now in her sixth year, hale and hearty, and still laying eggs at a good fast clip.

EAT, CAN OR SELL SLACKER HENS

"Watch for the slackers," is the advice given by N. E. Chapman, poultry extensionist with the Minnesota college of agriculture. "The time of year is approaching," he says, "when broody hens and slackers may reduce the percentage of egg production below profitable figures. It should be the aim of every poultry keeper to maintain at least a 50 per cent egg production. The slackers are hens too old or too lazy to pay their way, those

Coulson's Baby Chick Milk Mash

The Best Feed
for first six weeks

Write for particulars

Coulson Co.

Petaluma, Calif.

using their feed for making fat and those that have finished their year's production of eggs and are beginning to molt. The poultryman cannot reasonably expect to maintain a high production if he has many birds of this stamp. Cull them out at once. They should be eaten, canned or sold. The oldest and fattest are easy to pick out and hens beginning to molt, with legs still yellow and with small, yellow colored vent, are through with this year's production and will take a long and unprofitable vacation if kept on the farm."

HOW TO "BREAK UP" BROODY HENS

The time has come, says N. E. Chapman, poultry specialist with the extension division of the Minnesota college of agriculture, when poultrymen raising larger breeds—the so-called Rocks and Reds—will have more broody hens than they can use for hatching purposes. All such should be "broken up" as soon as possible, that they may be returned to the laying contingent of the flock and do their part in maintaining at least a per cent production. Mr. Chapman says the best method of interning a broody hen is to have a well ventilated coop or box with slatted or wire bottom so that the air will circulate freely and thus help to reduce the broody fever. Hens thus incarcerated should be well fed in troughs kept just outside of the coop and also should be given skimmilk or buttermilk. Good feed is essential at this time that the egg producing organs may maintain their force and vigor. The coop may be kept in the poultry house or outside, if well protected. From three to seven days confinement should suffice to effect a cure.

OSTRICH GROWING AS A BUSINESS

Just previous to the outbreak of the Great War, ostrich growing had become one of the important industries of Arizona. At that time there were in the Salt River Valley some 7,000 birds, or about 80 per cent of all the ostriches in the United States. Dame Fashion decreed that ostrich feathers should not be worn. It is possible that the people of Paris, where Dame Fashion is said to reside, had something else to think of than ostrich feathers for decoration and this may have had some influence in the decree. At any rate the price of feathers went down, down, until at last there was absolutely no demand and the patriotic owners of ostriches feeling that the food which they consumed was needed to help out the world's supply, disposed of them. A great many were killed and fed to hogs; some were turned loose on the desert; a few were kept by some of the farmers in the Salt River Valley and a sufficient number was sold to zoos and circus menageries so that people might not lose sight of the ostrich entirely. But the big ostrich farm, the largest in the world, which was formerly one of the show places of the Salt River Valley, was given over entirely to the production of feed for livestock.

At the height of the industry good ostriches were worth \$800 a pair, and even a six months old chick was valued at \$100. Feathers sold as high as \$125 a pound for the very best. The average production for a bird amounted to about \$25 to \$30 a year. About four birds on the average were kept to the acre on the alfalfa pasture. Pasturing, however, is not an economical way of feeding them, because they waste nearly as much as they consume. Where the alfalfa is cut and made into hay six or more can be kept to the acre.

Considerable experimental work was being done in the matter of feeding and breeding, and the ostrich growers were in a fair way to gather very much valuable data. They were spending considerable money in the importation of the best birds from South Africa, one bird owned by a Salt River Valley breeder alone being valued at \$5,000. The government had established an ostrich experiment station west of Glendale.

At the present time there are not more than 200 or 300 birds in the Salt River Valley but, in common with so many other commodities, ostrich feathers are rising in value. The present market quotations indicate a value which averages fully as high, if

not higher, than in any previous period, with the prospects of a further increase of at least 20 per cent within the next 30 days.

While it is not probable that ostrich growing as a business will ever assume the proportions which it did previous to the Great War, it may be that as a side line in conjunction with the maintenance of a proper rotation for cotton growing it will become a popular and profitable industry in a small way.

TRADE WITH CHINA

"It is time for the American people to realize that their future lies in great measure on the Pacific," says Julian Arnold, commercial attache to Peking, in a publication issued by the bureau of foreign and domestic commerce. "The opportunities of the United States on the Pacific are without limit, but its responsibilities will prove equally great. The only way it can meet these opportunities and responsibilities creditably to its own civilization and its own position, is by an intelligent and sympathetic understanding of the peoples of Asia and the present problems confronting them. Without this understanding we may unwittingly make some very disastrous mistakes."

China, Mr. Arnold asserts, is now at the dawn of what may prove to be the greatest industrial and commercial development that the world has yet witnessed. The Chinese are receptive to Western ideas and modern industrialism. The demands for machinery of all kinds during the next few decades will be enormous; in fact, the new China will be in the market for practically everything the West has to offer, especially metal goods, building materials, railway, mining and shipbuilding equipment, heating and sanitary appliances, motors and motor cars, knitting machines and textile plants, needles, nails, hardware, electrical machinery and equipment, industrial plants of nearly every description, and, indeed, everything needed to transform the country into a modern industrial commercial society. Mr. Arnold predicts that instead of 100,000 persons in the factories and 4,000,000 children in schools (the estimates for 1918), the China of a few decades hence will have 40,000,000 factory hands and 80,000,000 school children, figures proportionate to the present statistics of the United States.

"There need be no international jealousies," Mr. Arnold continues, "in the competition for the wonderful trade that China will have to offer, as there will be room for all." And he adds: "A strong, independent, self reliant China possessed of progressive ideals will prove a blessing to humanity. It behooves the West in its relations with China to work on broad lines in a spirit of cooperation rather than competition, with a vision for the future, as the day will come when the Pacific will be the world's great arena of trade and commerce, and that trade will be worth while only if it is built upon a foundation of friendship and good will."

WHEAT SHORTAGE IN SOUTH AFRICA

Consul General George H. Murphy, Cape Town, reports May 4, 1920: "The price of bread was on May 4 raised at Cape Town from 10 cents to 11 cents for the one pound loaf, with a corresponding increase in the price of ration and brown loaves. The price of flour has suddenly advanced from 65s to 76s (from \$15.82 to \$18.49, normal exchange) per sack.

"Supplies of wheat are very low owing to the action of the Australian government in refusing to permit the exportation of high grade flour and wheat to South Africa, and also owing to the adverse rate of exchange with the Argentine Republic. It is alleged that the farmers are refusing to sell before the end of June in order to escape the excess profits tax, and the outlook as regards breadstuffs is far more critical than it has ever been. It has also been stated that it may soon be necessary for the government to reimpose the Burton war bread law, which required the mixing of maize flour with that of wheat."

Brawley, Imperial County, shipped its first carload of honey to Milwaukee through the California Cooperative Association.

Tires You Know Are Right

POULTRY

BROODERS

We are offering to the California public the Reliable Blue Flame Brooder. It has a capacity of one thousand chicks. Burns one gallon of common kerosene oil in twenty-four hours, without gas, soot or odor. The most perfect brooding device yet placed on the market. In use, and endorsed by the Oregon Agricultural College, and the Western Washington Experiment Station, and two hundred other satisfied users in and around Seattle. We are western distributors. Have some good territory open. Write for circular. Queen Hatchery, 89 Pike Street, Seattle, Washington.

BABY CHICKS

A Fireless Brooder with every order of one hundred chicks. We ship in the brooder, thus there is no chance of chilling in transit and you have an excellent way to raise them. We have the following varieties of thoroughbred chicks every week: Anconas, Barred Rocks and R. I. Reds, \$20.00 hundred. Extra fancy dark R. I. Reds and White Rocks at \$25.00 a hundred. White Leghorns \$17.50. We guarantee safe delivery. Every one a strong, healthy chick. Orange County Hatchery, 403 E. Santa Clara, Santa Ana, California.

Spring Baby Chicks For Sale—400,000 S. C. White Leghorn baby chicks from heaviest laying (Hoganized) Stock. Price during May and June, 25, \$5.00; 50, \$9.00; 100, \$14.00. Special prices 500 and 1000 lots. Safe delivery guaranteed. You pay only for chicks received alive and in good condition; no money in advance, pay on delivery. Shipped safely anywhere west of the Rockies. Finest hatchery in the world. Established 1898. MUST HATCH INCUBATOR CO., PETALUMA, CALIF., 438 Seventh St.

White Leghorns — From the home of heavy layers. Buying carefully selected spring cockerels now is economy. We have them from our choicest pens. All breeders have orchard range. Fall chicks pay big. Free folder tells why. Curtis White Leghorn Ranch, R. 1, Box 29, Gardena, California. Phone 492.

Baby Chicks for August and September delivery. Barred Rocks and R. I. Reds, \$20 per 100. Fall delivery Anconas, \$20; MacFarlane strain W. Leghorns, \$16. Send 25 per cent of amount with order, balance before shipment. Hargett Hatchery, Route 2, Compton, California.

Baby Chicks from my carefully selected, thoroughbred flock of S. C. White Leghorns. May, June and July delivery at \$13.00 per 100. Good, strong chicks at this reasonable price. Write for particulars. J. R. Heinrich Poultry Yards, Arroyo Grande, California.

ATASCADERO POULTRY FARMS

S. C. White Leghorns, R. I. Reds and Anconas. Book your order now for next season's baby chicks. All chicks from carefully selected stock. Write Henry Miller, Supt.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Rhubarb and Fruits

Kindly advise me as to best time for transplanting rhubarb. What fruits may be raised successfully at an altitude of 2,500 feet where it frosts late in May? — Subscriber, Placerville.

The best time for transplanting rhubarb is April and May, but on a small scale, if care be given, the work may be done at any time. The list of fruits suitable for such elevation near Placerville is a long one. The writer has seen apples, cherries, figs, grapes, olives, peaches, pears and plums growing at 2,500 feet in El Dorado County. Inquiry in the neighborhood will reveal varieties which do best under the local conditions.

Old People's Home

In addition to the names given in last week's Cultivator we give the following located in Los Angeles: Mission Rest Home for the Aged, 526 San Fernando Road; Wm. Stritt Home for the Aged, Altadena; Hillside Rest, 1563 Fairmont Way; Southern California Home for Aged Women, 215 E. Ave. 57; St. Patrick's Home for the Aged, 4060 W. Washington; and Loma Linda Home, Loma Linda.

Potatoes All Tops

Kindly give us light on the potato situation. I, as well as my neighbors, are confronted with a wealth of potato vines, foliage and blossoms, but either a very few undersized or more frequently a total absence of potatoes, the roots being almost bare of growth. Would we better plow down the entire field and put in a crop of beans, or is there still hope of potatoes forming by the end of summer? This condition prevails almost throughout the entire region, regardless of methods or seed used in raising them. — Subscriber, Fullerton.

This trouble is very prevalent this year and quite baffling as it is being experienced by some of our best commercial growers. The consensus of opinion by experts is that it is almost wholly due to climatic deficiencies of the season. We have had no potato weather—no summer—up to July. It is extremely doubtful if a crop can be obtained as in all potato troubles when tops are grown well into the season no second growth can be made in the crop beneath.

Weed Pest Control

Who has charge of the control of Johnson grass in San Fernando Valley?—Subscriber, Owensmouth.

H. J. Ryan, horticultural commissioner of Los Angeles County, has jurisdiction over weed pest control in the San Fernando. We doubt not, however, that this office, like that of many other horticultural commissions of the state, has used so largely of its appropriation in the squirrel control campaigns that an active fight has as yet not been taken up on Johnson, Bermuda or other weed pests. However, any section which wishes cleanup will doubtless have the assistance of the horticultural commissioner either in Los Angeles or other counties of the state.

Tomato Blight

Will you kindly tell us where information may be secured on the treatment or prevention of tomato blight? —Subscriber, Moneta.

This has been answered or rather the information given in former Cultivators that there is practically no cure for this disease once established. Disease free seed in disease free soil is practically the only preventive. Once the vine shows the wilt it is practically dead. One who wishes to look up more fully on the subject may write Agricultural Experiment Station, University of California, Berkeley, and ask for "Tomato Diseases in California," Bulletin 239.

Torrens Titles

Is the Torrens title law in operation, and how can one get in touch with it?—Subscriber, Chula Vista.

The Torrens title is proving effective and economical though more expensive to secure than was at first thought it would be. We believe the federal land bank recognizes the Torrens title, which should be best proof of its worth. This is not the case, however, until 12 months have elapsed from time of filing in the county. However, this question has been referred to our attorney and will be answered more fully in his department another week.

Walnuts Dying

I planted a Franquette walnut tree in April, 1919, and it seemed to be doing well until this spring when it put out a few buds which dried up. The trunk of the tree seems to stay green. The tree has good soil and climate. Can you suggest any reason or remedy for this condition?—Subscriber, Elk.

Presumably this is winter killing which may have been caused by frost in early fall before wood was fully matured, or it may have been from lack of fall irrigation and the trees were unable because of dry condition of the soil to secure sufficient moisture to perfect buds growing at that time for next season's growth. More complete information can be had by writing Agricultural Experiment Station, University of California, Berkeley, and asking for Circular 216.

SUNFLOWERS FOR SILAGE

Sunflower silage has much the same feeding value as corn silage, according to the few analyses that have been made at the North Dakota agricultural college and short feeding experiments made in New York and Montana. The trials made at the Williston and Dickinson substations indicate that one can expect one-fourth to one-half heavier yields from sunflowers than from corn. Dr. Walster of the North Dakota agricultural college states that mammoth Russian or Giant Russian is probably the best variety, but the Black Beauty and White Beauty are also good. The seed costs 18 to 20 cents per 100 pounds. It takes five to seven pounds per acre. It can be sown with the corn planter. If the land is clean, seed in rows; if weedy better plant in hills and cultivate both ways. Sunflower seed can also be sown with the grain drill, closing up some of the holes so as to sow in rows 36 to 42 inches apart.

Cultivate as for corn. Cut for silage when from one-half to three-fourths of

the seed is in the late milk or early dough stage. Use corn harvester. All reports indicate that sunflowers can stand more cold than corn in both spring and fall.

EGGS MARKETING AT CREAMERIES OR CHEESE FACTORIES

A new business venture for the rancher is the marketing of surplus eggs and poultry through the creamery or cheese factory. As a rule not all creameries are equipped for the new business, but those which have engaged in it find it very profitable. A systematized business of this sort improves the quality of the products and greater financial returns are made.

This plan of marketing eggs and poultry is highly endorsed by the authorities.

THE MILK COW LEADS THE PROCESSION

In comparison with all other classes of farm animals which produce human food the farm cow that gives milk stands first. On January 1, 1920, the good old milk "bossy" of the farms of the United States gave a total valuation of \$2,022,000,000. This enormous figure excelled the total value of all other cattle.

In 1915 the average price paid for a milk cow was \$58.25, and in 1919 the price increased to \$91.95, or a gain of 58 per cent in five years.

News has come from England of the death of Edwin Cawston, who established large ostrich farms in California and Arizona.

HULLED BARLEY

Cuts Unit Cost of Eggs

The cost per egg is materially lowered by feeding P. C. A. Hulled Barley—treated by a special process to retain protein values. P. C. A. Hulled Barley outranks wheat in producing eggs at a low unit cost.

Order P. C. A. Hulled Barley from your dealer or communicate with us.

A BAND IS SUCH A BRAVE, BRIGHT THING

By Nancy Byrd Turner

A band is such a brave, bright thing,
With tassels tossed, and burnished brass,
And music quick and fluttering—
I love to see one pass.

Sometimes it sounds for turning wheels,—
A circus coming into town,—
And then the tune gets in my heels
And shakes them up and down.

Sometimes it sounds for marching men,
With cry of bugles in the street,
And fair flags blowing free—and then
I cannot hold my feet.

I follow, follow on and on;
I let it lead me where it will;
And when the last clear notes are gone
Somehow I hear them still.

CONTACT WITH THE ENEMY

By Russell Gordon Carter in
Youth's Companion

UVIGNY had been taken. After a terrific artillery preparation the Americans had gone over early that morning with the French on the right and left, and, although the cost in lives had been heavy, the soldiers of the small but swiftly growing American army had shown once again their value under fire. The American front line extended roughly two kilometers beyond the captured village and then curved backward on both sides of the sector where the French had been stopped. Heavy machine gun fire could be heard in the distance; but in front of the American line there was not a sign of the enemy except harassing shell fire and an occasional scout plane.

Private Dick Ellis of the battalion scouts lay on his side in an open field and with the bent lid of his mess kit scooped out the earth beside him. Round him other men were similarly engaged; some dug with their intrenching tools, some with bayonets. Their faces, bronzed by the sun of France and flecked with mud, showed the ordeal that they had been through during the last few days.

"I'm dead tired," Dick said to himself; "but I'll sleep better when I get this hole dug."

He looked up as a runner from the rear reported to the lieutenant in command, who had established headquarters in a shell hole not far behind Dick's position. A few minutes later came the voice of his sergeant:

"Hey, Ellis, you and Carlson and Wallace!"

When the three men had assembled, the sergeant explained. "We've got to go ahead and establish contact with the enemy—find out where his front line is and his machine guns. Ellis, you take the left and head for that strip of woods over there. Wallace, you take the right, and, Carlson, you take the center with me. Report back here as soon as you find anything."

Dick returned to the hole he had been digging, swung his equipment and started for the strip of woods almost a kilometer away. He leaned far forward as he walked, trailing his rifle, and took advantage of each rise of ground to screen him from view.

High explosive and gas shells were dropping every few minutes in and around the ville of Juigny on the crest of the hill behind him. As Dick glanced back he could see the clouds of dirt and black smoke that went up whenever a shell landed in the ruined village. On the right the French seventy-fives were active, and far to the left anti-aircraft shells were bursting high in the sky.

The ground that he passed over was cut up by artillery fire; long belts of machine gun bullets and other bits of German equipment lay scattered about. Reaching the strip of woods without incident, he proceeded through it with eyes and ears alert. The strip was perhaps one hundred meters wide where he entered, though it widened out more to the left. Pausing at the farther edge, flat on his stomach, he pushed his rifle out in front of him and scrutinized the country beyond.

It was rolling country, characteristically French, with alternating squares of woods and farm land after the fashion of a patchwork quilt. The day was gray, and rain threatened. In less than two hours he would be able to see almost nothing; even now

he could not see plainly for any great distance.

Drawing his field glass from beneath his slicker, he regulated the sights and studied the landscape. On the edge of the woods that covered the hill in front of him he thought he detected a slight movement. He rested his eyes and then looked again, but he could not be sure.

A little mound of earth lay directly in front of him. If he were to crawl out to that, he might get a better view. He cautiously crept forward, keeping his face to the ground as much as possible, for he felt sure that there were Germans in the woods beyond, and he was within rifle fire of the spot. When he reached the mound of earth he looked at the strip of woods that had sheltered him, and for a moment he wished he had not left it. Then he took up his field glass again.

Yes, there were Germans there. "One, two, three," he counted. They seemed to be digging. Some distance to the left of the group he made out a fourth.

"The whole Boche front line," he thought. "I'll bet it follows the edge of that wood away to the left, too."

He drew a piece of soiled paper from his pocket and with the stock of his rifle for a rest made a sketch of the country, indicating the information he had gained and estimating the distance to the enemy woods at three-fourths of a kilometer from his position. As he was about to fold up his sketch a puff of wind sent it out of his fingers. He grasped for it, recovered it and put it into his pocket.

"Now, to get back with this and give the artillery something to fire at," he said to himself as he carefully turned toward the little strip of woods that lay about fifty meters away.

Suddenly a machine gun sounded,—put, put, put!—and three bullets cracked over his head. He turned and threw himself back into his original position, with his face flat in the dirt and his arms close to his sides. His heart beat wildly. Again the machine gun sounded—a burst of six shots, followed immediately by six more. Its aim was lower, and several of the bullets, striking the earth ahead of the boy, threw dirt into his face. For several minutes Dick lay as if frozen to the ground. So slight was the protection that the mound of earth afforded him that he feared to move a muscle. After a while he began to scratch at the loose dirt with his fingers until he had succeeded in lowering his head and shoulders a few inches. Then he wriggled out of his pack and reached for his mess kit cover. Again came the firing. One of the bullets struck a stone ahead of him, ricocheted and, with a screech that sent a chill down his spine, went whirling end over end into space.

The firing had come from the woods directly in front, where he had seen the Germans. When it ceased, another gun on his left began.

"I'm in a fine fix," he said to himself, as he plied his rough intrenching tool. "Two Boche machine guns with a clear field of fire. They spotted me when the wind blew that paper out of my hands."

When he had strengthened his defense, he lay quiet for almost fifteen minutes. Both guns were silent. He rubbed his helmet in the damp earth, readjusted it on his head and then looked up cautiously. Out in front, some distance away, lay the twisted muzzle of a machine gun that had evidently been struck by a heavy piece of shrapnel. It lay on the edge of a short trench that the Germans had abandoned for their stronger position on the hill. The ground hereabouts was also strewn with various pieces of equipment, which bore witness to the speed with which the Germans had retreated that morning.

Dick turned his eyes toward the strip of woods. It would soon be dark. Why could he not crawl back to the protection of the woods under cover of darkness before they sent a patrol out after him?

A fog was settling over the country. It was already thick and heavy in the little valley that lay between Dick and the two machine guns, and with the fog darkness was coming on rapidly. Dick shivered as he lay in his cramped position. With hope for

a fighting chance to escape, he waited only for a favorable moment.

As he waited, the fog changed to a fine drizzle. He raised his head; he could scarcely see the line of woods that lay in front of him.

"Now's the time," he said to himself. "If I can only reach that little strip of woods!"

He raised his shoulders and on hands and knees turned toward the coveted strip of woods. A quick dash and he would be safe. He drew his knees up under him. His heart beat like a trip hammer. Suddenly out of the mist and darkness came a succession of flashes. He threw himself flat as the bullets cracked close to his head. Then all was silence. It was the machine gun on the left. He waited. The other gun fired a short burst, and a moment later the gun on the left opened up again. The bullets were not cracking so close to him as they had done before; but each burst was aimed to cover the stretch of ground between the boy and the strip of woods. The Germans had anticipated his plans.

He bit his lips and trembled in spite of himself. "Wonder how many they'll send after me?" he thought as he gripped the stock of his rifle a little tighter.

Night had set in, and the drizzle had increased to a rain that soaked him to the skin. Mingled with the intermittent fire of the two machine guns came the dull boom of the heavy artillery, low and ominous. To the right a yellow flare went up, flickered fitfully for a few minutes and then went out.

Dick clenched his fingers until the nails dug into his flesh, then like a flash he threw himself into a sitting posture. "They won't get me!" he exclaimed. "Not without a fight!" Adjusting his bayonet to the end of his rifle, he crawled forward directly toward the enemy line. He moved through the wet grass over the shell torn country in the direction of the gun in front of him. As it flashed he could hear the bullets speed just above his body. In a few minutes, which seemed like hours to him, he came to the old trench where he had seen the twisted barrel of the machine gun. Dropping into the trench, he waited. The trench was about five yards long and had apparently been used merely as a machine gun position.

"They're sure to send a patrol after me," he thought, "and then—"

(Continued next week.)

COTTAGE CHEESE FOR HOT SUMMER DAYS

Cottage Cheese Salad

Mix thoroughly one pound of cheese, one and one-half tablespoons cream, one tablespoon chopped parsley and salt to taste. First, fill a mold with cold water to chill and wet the surface; line the bottom with waxed paper, then pack in three layers, putting two or three parallel strips of pimento between layers. Cover with waxed paper and set in a cool place until ready to serve; then run a knife around the sides and invert the mold. Cut in slices and serve on lettuce leaves with French dressing and wafers. Minced olives may be used instead of the parsley, and chopped nuts also may be added.

Cottage Cheese Rolls

To be used like meat rolls. A large variety of rolls, suitable for serving as the main dish at dinner, may be made by combining legumes (beans of various kinds, cowpeas, lentils, or peas), with cottage cheese, and adding bread crumbs to make the mixture thick enough to form into a roll. Beans are usually mashed, but peas or small Lima beans may be combined whole with bread crumbs and cottage cheese, and enough of the liquor in which the vegetables have been cooked may be added to get the right consistency; or, instead of beans or peas, chopped spinach, beet tops, or head lettuce may be added.

Boston Roast

One pound can of kidney beans or equivalent quantity of cooked beans, one-half pound cottage cheese, bread crumbs, salt.

Mash the beans or put them through a meat grinder. Add the cheese and bread crumbs enough to make the mixture sufficiently stiff to be formed into a roll. Bake in a moderate oven, basting occasionally with butter or other

Hires Household Extract

will make home-made rootbeer easily and economically. Get a 25c bottle from your grocer. A cake of yeast and some sugar—that's all. One bottle makes 80 glasses

Hires Household Extract contains the actual juices of roots, barks, herbs and berries. It makes rootbeer as pure as it is sparkling and delicious.

With our special airtight patent bottle stoppers you can keep the snap and sparkle in your home-made rootbeer until ready to serve. Your grocer has them.

FARMERS Are Working Harder

And using their feet more than ever before. For all these workers the frequent use of Allen's Foot-Ease, the antiseptic, healing powder to be shaken into the shoes and sprinkled in the foot-bath, increases their efficiency and insures needed physical comfort. Allen's Foot-Ease takes the Friction from the Shoe, keeps the shoe from rubbing and the stockings from wearing, freshens the feet, and prevents tired, aching and blistered feet. Women everywhere are constant users of Allen's Foot-Ease. Don't get foot sore, get Allen's Foot-Ease. Sold everywhere.

Big Money Boring Wells

Have water on your own farm. In spare time make wells for your neighbors. It means \$1000 extra in ordinary years, double that in dry years. No risk—no experience needed. Outfits for Getting Water Anywhere. Earth augers, rock drills and combined machines. Engine or horse power. Write for easy terms and free catalog. L. S. MFG. COMPANY Box 716 Clarinda, Iowa

Kill All Flies!

THEY SPREAD DISEASE. Placed anywhere, DAISY FLY KILLER attracts and kills all flies. Neat, clean, ornamental, convenient and cheap. Lasts all season. Made of metal, can't spill or tip over; will not soil or injure anything. Guaranteed. DAISY FLY KILLER at your dealer or 5 by EXPRESS, prepaid, \$1.25. HAROLD SOMERS, 150 De Kalb Ave., Brooklyn, N. Y.

INSYDE TYRES

—genuine inner armor for auto tires. Double mileage; prevent punctures and blowouts. Easily applied without tools. Agents wanted. Details free. American Accessories Company Dept. 90 Cincinnati, Ohio

fat, and water. Serve with tomato sauce. This dish may be flavored with chopped onions, cooked in butter or other fat and a very little water until tender.

Pimento and Cottage Cheese Roast

Two cups cooked Lima beans, one-fourth pound cottage cheese, five canned pimentos chopped, bread crumbs, salt.

Put the first three ingredients through a meat chopper. Mix thoroughly and add bread crumbs until it is stiff enough to form into a roll. Brown in the oven, basting occasionally with butter or other fat, and water.

Cottage Cheese and Nut Roast

One cup cottage cheese, one cup chopped English walnuts, one cup bread crumbs, two tablespoons chopped onion, one tablespoon butter, juice of half a lemon, salt and pepper.

Cook the onion in the butter or other fat and a little water until tender. Mix the other ingredients and moisten with the water in which the onion has been cooked. Pour into a shallow baking dish and brown in the oven.

Cheese Sauce

One cup milk, one tablespoon cottage cheese, two tablespoons flour, salt and pepper to taste. Thicken the milk with the flour and just before serving add the cheese, stirring until it is melted. This sauce may be used in preparing creamed eggs or for ordinary milk toast. The quantity of cheese in the recipe may be increased, making a sauce suitable for using with macaroni or rice.

BALTIMORE RELISH

Two quarts green tomatoes cored, two quarts ripe tomatoes peeled, cored and chopped fine, one quart shredded cabbage, 12 onions sliced thin, four green peppers, four red peppers sliced thin.

Mix altogether with half cup salt, let stand over night. In the morning drain well and add the following materials:

One and one-half quarts good vinegar, two cups sugar, one-fourth cup whole mustard, one-half cup grated fresh horseradish, one tablespoon celery seeds, one teaspoon coriander seed, one-half teaspoon cayenne, salt if necessary.

Cook half hour and fill small sterilized jars with the relish. Adjust rubbers and the covers. Place filled jars in a kettle on a rack, allow slightly warmed water to come up half way on the jars; cover kettle and let the water boil ten minutes around the jars. Remove jars, tighten covers. Good inside of a week.

WHAT SHALL WE DO ABOUT IT?

By Larry Larrimore

What shall we do about it? Try with all our might. Our credit side will not stretch out. But our debit's out of sight. What shall we eat tomorrow? What shall we wear today? Has it come to "back to nature," Fig leaves, and a wisp of hay?

Lumber still is soaring. Water costs like sin. Machinery's out of sight. So how shall we begin? Enormous the cost of production; Alas, there is no redress. The things we sell are the same old price. Or else (is it fair?) they are less.

What shall we do about it? This way bankruptcy lies. Farmers, arise from your slumbers; Get busy and organize. Organize for a standard price. That shall squelch the profiteers. United we win, divided we lose—Who are the pioneers?

Farmers, repeat this little verse, Morning, noon, and night: "Let's organize, let's organize, Let's up and do things right. Let's organize, let's organize, Let's make H. C. L. ill; Let's organize, let's organize—Who'll organize? We will!"

LENTIL CROQUETTES

Take one pint of lentil pulp, one-half pint of bread crumbs (entire wheat preferred), three beaten eggs, two tablespoons of grated onions, one-fourth cup butter. Salt and pepper to taste. Mix ingredients together; cook in double boiler or steam until eggs are set. Chill, then form in croquettes. Dip in egg, roll in crumbs and fry in deep fat. To add one-half cup shredded English walnuts or pecans imparts a rich, delicious flavor.

COSTS OF ELECTRICITY

The following data may convince some folks that certain luxuries are within their reach. This is based upon electricity costing ten cents per kilowatt hour and the unit of time is the hour: Coffee percolators, 6 inch stove, 1 to 5 cents; curling iron heaters, 3 cents; flat iron, 3 pound, 2 3/4 cents; flat iron, 6 pound, 4 3/4 cents; foot warmers, 1/2 to 4 cents; nursery milk warmers, 5 cents; ovens, 12 to 15 cents; ranges 3 heats, 4 to 6 people, 10 to 44 cents; range, 3 heats, 12 to 20 people, 20 to 75 cents; shaving mugs, 1 1/2 cents; waffle irons, 2 waffles, 7 1/2 cents.—L. F. Foltz, Colorado Agricultural College.

CHEW IT LONGER

Is the cost of the daily meals worrying you? Then spend twice the time in chewing your food. You will feel better, be more satisfied, and will eat less. Most people are content to bolt down their food and leave nature to do what they should have done themselves. Nature becomes overworked and soon calls a halt. Then comes a bad stomach, poor digestion, peevishness, excitability and a general weakening of productive powers. No person can do justice as a producer unless he is in good health, and good health can only be maintained by a proper mastication of food.—Lake County Bee.

TO THE ACCOMPANIMENT OF SOBS

Wayne B. Wheeler, national counsel for the anti-saloon league, was talking to a New York reporter about a judge.

"The judge," he said, "has misread the law—innocently misread it, of course. The old fellow is like the greenhorn nurse from Ballyunion."

"A young matron said to her Ballyunion nurse one afternoon:

"My goodness me, Bridget, what's the matter with Willie's face? Has he been run over, or something?"

"None, 'ain't so bad as that," says Bridget. "It's only a bad boomp he got, mum. Yez told me, mum, I was to let him play on the pianny, and he was slidin' on the top of it when, bliss his little heart, he slid too fur, mum, and come a cropper!"—Detroit Free Press.

ANOTHER ONE

When the train stopped at a little station in the South a tourist from the North emerged and gazed curiously at a lean animal rubbing itself against a scrub. "What do you call that?" he asked a native.

"Razor back hawg, suh."

"What's he rubbing himself against the tree for?"

"He's stroppin' hisself, suh, jes' stroppin' hisself."—Everybody's Magazine.

THAT SETTLED THAT

The ex-buck found the menu card at the fashionable restaurant almost as baffling as some he'd perused in France. Finally he summoned a waiter.

"Where are pork and beans on here?" he asked.

The waiter indicated. "Well," said the relieved patron, "bring me everything above and below that line."

NOT HER IDEA OF HEAVEN

The conversation around the long dinner table ended, as do most conversations nowadays, with the subject of spiritualism. The guests and the members of the family gave their opinions as to whether or not the dead could communicate with the living, but it remained for "sweet sixteen" to present the only original thought on the subject.

"It's hard enough now for me to keep up my correspondence," she said. "When I die I want to rest."—New York Sun.

If an S and I, and an O and a U,
With an X at the end spell Su,
And an E and a Y and E spell I,
Pray what is a speller to do?
Then if also S and an I and a G
And a H E D spell side,
There's nothing much left for a speller to do
But go and commit slouxeysighed!

—the hit that saved the day.

HONEY

Old honey practically exhausted, new supply light; few sales; demand good; movement limited. Carloads f. o. b., usual terms. New crop orange, 21; Hawaiian lt. amber, 17½. Old crop white amber sage, 19; wh. alfalfa, 19½. Beeswax, 42.

BEANS

California Lima Bean Growers Association reports under date of July 3:

There is very little new to report in the Lima and Baby Lima bean market situation. Very little buying has been done during the past few days, the dullness extending to all varieties of beans. The bean trade generally seems to anticipate an improved buying demand and higher market during July and August and when the stock of Limas sold for July shipment have gone, very little will remain in California. The weather thus far this season in Southern California has been generally cool and foggy and therefore favorable for Limas and Baby Limas. A considerable part of the acreage planted to Lima beans is not under irrigation and having only a limited amount of moisture can stand but very little hot dry weather, but the crops are certainly looking very well now and with continuation of favorable weather extending until harvest time a considerably better yield than last year would seem to be assured.

HAY

Alfalfa Growers of California, under date of July 7, says:

Market steady with prices approximately as follows: Choice alfalfa, 40.00 per ton, No. 1 dairy, 36.00; standard dairy, 32.00; stock alfalfa, 29.00.

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay: Tame Oats 25.00@27.00 Barley 18.00@24.00 Alfalfa 26.00@32.00 Barley straw 8.00@10.00

GRAIN AND FEEDS

A little weaker, especially in spot stuff. There is a great range in price because of vast difference in quality.

Milo: Good bright, Imperial milo is commanding 3.35 and Eastern milo is running as low as 2.80.

One car Kansas bran sold on track L. A., July 6, \$61.00 ton.

Wheat: Utah-Idaho Milling, 6.00; feed wheat is running around 4.45@4.55.

Corn: Sacked, Yellow, 3.85@3.91½.

Price bid local grain exch. cwt. July 6:

General trend of market downward on barley.

Barley: 2.77½@2.85.

Milo: Carlots, 2.75@3.35; Eastern, 2.78½.

Wheat: Mixed feed, 6.05@6.35.

LIVESTOCK

Western Meat Company prices are:

Cattle: Grass steers, No. 1, weighing 1,000 to 1,200 lbs., 10@10½; do, 1,200 to 1,400 lbs., 9½@10; do, second quality, 7@8; thin, 6@7. Bulls and stags: Good, 3½@4; fair, 3@3½.

Cows and heifers: No. 1, 8@9; second quality, 6@7; common to thin, 2@4.

Calves: Lightweight, 10½@11; medium, 9@10; heavy, 8@8½.

Lambs: Milk, 11@11½; yearlings, 8@8½.

Sheep: Wethers, 8@8½; ewes, 6@6½.

Hogs: Weighing 100 to 150 lbs., 15; 150 to 225 lbs., 15½; 225 to 300 lbs., 15; 300 to 400 lbs., 14.

Virden Packing Company quotes prices on livestock, weighed and delivered off cars at its plant, South San Francisco, as follows:

Cattle: Good steers, 1,000 to 1,100 lbs.,

10@10½; top steers, 1,100 to 1,200 lbs., 9@9½; good heifers, 1,200 lbs. and over, market price; good cows and heifers, 7½@8; No. 2 cows and heifers, 6½@7; good bulls, 4½@5.

Calves: Light, 13@14.

Hogs: Top packer, hard and well finished, 100 to 150 lbs., 14½; 150 to 225 lbs., 15½; 225 to 300 lbs., 14½; over 300 lbs., 14; under 100 lbs., 13½.

Ewes: Full wool, 6½@7.

Wethers: Full wool, 7½@8.

Yearlings: 9@9½.

Milk lambs: lb., 10@11.

ONIONS

Onions: New reds, 59@75; whites, 75 cr.; green onions, 1.40@1.75. Garlic, new, 9@11.

POTATOES

River, cwt, 4.00@5.00; fy., 5.50; Garnet Chilli, 4.00@5.00.

VEGETABLES

Wholesale selling price: Asparagus: lb., white, 6@8; graded, 9@11.

Beans: lb., String, 4@6; Wax, 5@6.

Cucumbers: Eng., doz., 75@1.00; other, 75@1.25 per box.

Corn: Sack, 4.00@6.00.

Eggplant: Livingston, 10@12½; So., 5@10.

Okra: bx. 1.00@1.25.

Peppers: Bells, 15@20 for large, 5@8 for small; Chilli, 15@20.

Peas: lb., green, 2½@4.

Radish, 7@9 doz. bunches.

Spinach: lb., 4@5.

Squash: Summer, cr., 50@75; Sacramento, lug, 1.50@2.00.

Tomatoes: cr., 1.00@1.75.

DECIDUOUS FRUITS

Apples: Red Astrachan, Los Angeles lug, 1.25@1.50; wrapped, 2.00@2.25.

Apricots: Imperial Valley, Los Angeles lugs, 5@9 per lb.; 1.25@1.50 per crate.

Bananas: lb., 8@10.

Cantaloupes, Ponies, 1.75@2.25; standard, 2.00@2.75; flats, 75@1.35 box.

Cherries: Black, 1.50@1.75 per drawer; blacks, 6@12½ lb., according to quality; Royal Anna, lb., 12@16.

Currants: 45@60 dr.; 5.00@7.00 ch.

Figs: 65@80 for white and Brunswick per box of one layer; two layer, 1.00@1.25.

Gooseberries: lb., 5@7.

Loganberries: Red, dr., 35@50.

Peaches: boxes, 1.00@1.50.

Pineapples: Doz., 2.00@3.00.

Plums: Apex, 1.25@1.50 per crate; Beauty, 1.50@2.00; Climax, 1.50@2.00; Clyman, 1.25@1.50.

Raspberries: dr., 75@1.10; cr., 1.75@2.25.

Strawberries: Large, 75@1.00; small, 50@75.

Watermelons: Imperial Valley, lb., 2@4.

Honey Dew: cr., 2.00@2.50.

CITRUS

Box: Lemons, standards, 2.50@5.50; lemons, 1.25@2.00; grapefruit, 2.00@3.50; navel oranges, 4.00@6.00.

BEANS AND PEAS

California Bean Growers Association, San Francisco, July 3:

Quotations this date:

Large Whites 6.25@ 6.40

Small Whites 5.75@ 6.10

Pinks 6.30@ 6.50

Cranberries 6.75@ 7.00

Black Eyes 8.25@ 8.50

Red Mexicans 8.50@ 8.75

Red Kidneys 14.00@14.50

Bays 10.25@10.50

HOPS

1919 crop, 85@1.00 per lb. Prices to growers for 1920 crop, 65@80 per lb.

HONEY

Reported by Rafael & Wing:

Very little honey arriving. Not enough sales to establish prices. White orange offering in this market at 20@21. No change in wax. It is bringing from 40 to 42. From all indications, there will be a very good honey crop from the San Joaquin and Sacramento valleys. The sage crop in Santa Clara and San Benito counties is practically a failure. Some Honolulu honey offering, but not enough to affect the market.

GRAIN

Wheat: No quotations obtainable.

Oats: Red feed, 3.10@3.20.

Corn: California Yellow, 3.80@3.90 per cental; California milo maize, 3.45@3.50.

Barley: No. 1 feed, 3.05@3.15.

HAY

Under date of July 3, A. W. Scott Co. says:

Receipts past week 2,349 tons. San Francisco market continues lifeless although arrivals are heavier, demands still lighter. Quite a bit of last week's receipts was for government shipment and did not go into trade. New hay is now making what market there is as practically every wisp of old crop hay has been cleaned up throughout the state. The financial situation seems to be reflected in hay market conditions. The expressed determination of the banks to prevent speculative storing and to require the producer to carry his crop until bought for actual consumption has caused dealers throughout the state to hold off from their customary stock purchases. Alfalfa is dull and prices weaker. The unusual high prices asked, which are about double last year's figures, prohibit grinding and shipment of alfalfa meal to the Eastern market for the present—as a result this demand has dropped off and second cutting is offered more freely and at lower figures without buyers. The export market is very dull and quiet—buyers apparently waiting for a lower market.

We quote today wholesale prices in carload lots (old crop) as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.)

Old Hay:

Prices nominal. Old straw nominal.

New Hay:

Wheat hay (light 5 wire bales) 25.00@28.00

Tame Oat hay 25.00@28.00

Wild Oat hay 20.00@22.00

Barley hay 20.00@23.00

Citrus Markets

Los Angeles, July 7, 1920.

Almost every section is competing for the privilege of buying California oranges. New York quotations show prices range above \$8.00. The number of cars on track is light in all markets. F. o. b. quotations are ranging between \$5.00 and \$6.00. California cantaloupes are also selling along side of California oranges and commanding liberal prices.

The drop has been lighter than expected south of the Tehachapi and prospects are for a big crop. In Central California, however, the drop was quite severe because of the two hot days about the middle of June.

The lemon market is flat. The supply of foreign is increasing and is now approaching the 200,000 box supply, either on docks or due to arrive within 30 days.

Shipments

Shipments of oranges to date from Southern California since November 1, 1919: Oranges, 23,801 cars; lemons, 6,167; total, 29,968. To same date last season: oranges, 26,754; lemons, 7,501; total, 34,255. From Central California to date this season: Oranges, 5,374; lemons, 288; total, 5,662. To same date last season: Oranges, 3,711; lemons, 251; total, 3,962. Northern California this season: Oranges, 261; lemons, 23; total, 284. To same date last season: Oranges, 244; lemons, 2; total, 246.

AT THE AUCTIONS

July 1

New York: 13 or. Val. 7.45-10.95, Grapefruit, 2.00-2.75. Bloods 6.90-7.90, Seeds 7.15-7.75, St. Mikes 4.10, halves to 8.95 for full size.

Boston: 6 or., 6 lem. Val. 5.45-7.70, Nav. 7.45-8.10, St. Mikes 8.00-8.25, lem. 1.15-2.40.

Pittsburgh: 8 or., 2 lem. Val. 5.30-7.45, lem. 1.45-3.10.

Philadelphia: 4 or., 3 lem. Val. 6.70-8.20, lem. 2.00-3.75.

July 2

New York: 12 or. Val. 6.95-10.10, Bloods 6.45, Seeds 7.25-7.70, lem. 3.20.

St. Louis: 4 or., 6 lem. Val. 3.90-6.65, lem. 1.65-3.35.

Cincinnati: 4 or., 2 lem. Val. 4.15-6.75, lem. 2.15-3.45.

July 6

New York: 53 or., 1 lem. Val. 5.00-10.30, most of sales running between 7.00 and 8.00, St. Mikes 6.80-8.25, Bloods 6.50, Seeds 7.05-7.70, Grapefruit 1.85-3.35, lem. 4.10-4.70.

Pittsburgh: 8 or., 3 lem. Val. 1.70-7.50, Grapefruit, 1.00-2.30, lem. 95-1.85.

Boston: 13 or., 8 lem. Val. 5.40-8.50, St. Mikes, 7.25-8.05, lem. 1.05-2.95, most of sales running a little above one dollar.

Philadelphia: 7 or., 5 lem. Val. 6.05-9.45, lem. 1.10-2.35.

Baltimore: 3 or., 1 lem. Val. 6.00-7.75, lem. 90-95.

PROTECT FROM FIRES

Regarding fires which may be caused in operating power machinery or automobile vehicles, here is a section from the state law which will be of interest to operators:

"Section 1. Section 384 of the Penal Code is hereby amended to read as follows:

"Sec. 384. Any person who shall willfully or negligently commit any of the acts hereinafter enumerated in this section shall be guilty of a misdemeanor, and upon conviction thereof be punishable by a fine of not less than \$50 nor more than \$500, or imprisonment in the county jail not less than 15 days nor more than six months, or both such fine and imprisonment.

"Sec. 46. Operating or causing to be operated any gas tractor, oil burning engine, gas propelled harvesting machine or auto truck in harvesting or moving grain or hay, or moving said tractor, engine, machine or auto truck

is grown, then the weeds will be eradicated by the cultivation.

The crop being some small grain, either fall or spring, then the best method is to plow the ground early in the fall and let it lie for a week or two until the weed seeds have sprouted, then disk them under. This will kill the seeds and the fall crop may be planted in plenty of time to sprout before the frost stops its growing. If the crop is to be planted in the spring, then proceed as for the fall crop, but disk the ground in the spring just before planting the crop.

Then get the neighbors to do the same, for the weed seeds will blow from one place to another, so that the work of one will only be partly effective.

GOOD WHITEWASH FORMULAS

W. M. Russell, dairy inspector in Fresno, Madera and Kings Counties, reports the receipt of the following whitewash formula, which has been

DAIRY COUNCIL TO MEET AT HANFORD

Sam H. Greene, secretary-manager of California Dairy Council, announces the first annual meeting of the council at Hanford, July 14 and 15. Greene says it will be the greatest educational meeting that the dairying industry in California has ever held. The National Dairy Council and the United States department of agriculture will send representatives, as also will the state board of health, the state board of education and the University of California.

The dairying interests of Kings County and the people of Hanford have made large plans to entertain the convention. One of the principal features is an old fashioned barbecue at noon July 15. An attendance of 2,000 is being prepared for. The complete program will be made public soon.

ed one-third of the amount of peaches produced by the entire state of Georgia. Sullivan estimated that the value of the Sutter County peach crop this year would be about \$3,000,000 and said that the acreage production was also higher than any other section of the state, but with Fresno again a close second.

He stated that Sutter County also raised 75 per cent of the Thompson Seedless grapes in the Sacramento Valley, but declared he could not estimate the value of this crop as yet, although it would be considerable as much new acreage in Thompson Seedless was coming into bearing this year. Sutter County, he states, is also coming to the front as a prune raising county, and a considerable prune acreage is being planted each year.

in or near any grain or grass lands unless he shall maintain attached to the exhaust on said gas tractor, oil burning engine or gas propelled harvesting machine an effective spark arresting and burning carbon arresting device."

The enforcement of this law will compel every person operating a tractor in the grain or grass fields to install proper spark arresters or to run the risk of arrest, with imprisonment and fine in case of setting fire.

DO AWAY WITH WEEDS

No weeds to burn. The annual procedure of tearing the weeds away from the fences and out of the ditches can be dispensed with. Sounds good and is possible with care and thorough methods.

Grow some crop on every corner in the cultivated fields. If the field is not under cultivation then keep it well pastured. If it isn't planted to some crop or pastured, spend a day or two disking all the places where weeds are growing when they are two to three weeks old. Don't let them become mature and scatter seeds. These suggestions come from Bruce Cameron of Colorado agricultural college.

Cut all weeds away from the ditch banks and the fences when the first alfalfa is ready to be cut.

If the weeds are in the fields where other crops are to be grown, then different methods must be used. The best way to eradicate them is to plant the field to some perennial crop such as alfalfa or clover, then the weeds will be cut every year before they are mature, and if the ditch banks are kept free from weeds they will soon be eradicated. If some other crop, as corn, beets, potatoes or beans

highly recommended for use on the dairy farm:

Outside

To half a bucketful of unslaked lime add two handfuls of common salt and soft soap at the rate of one pound to 15 gallons of the wash. Slake slowly, stirring all the time. This quantity makes two bucketfuls of very adhesive wash which is not affected by rain.

Inside

Slake lime with water and add sufficient skim milk to bring it to the consistency of thin cream. To each gallon add one ounce of salt and two ounces of brown sugar dissolved in water.

The germicidal value of these two recipes may be increased by adding three-fourths pound of chloride of lime to every 30 gallons of the wash.

Buttermilk and Cement Paint

The following recipe is recommended as having given good satisfaction. Three pounds of cement are added to a gallon of buttermilk and thoroughly mixed. A larger quantity can be made by using the same proportions.

This paint must be applied soon after it is mixed, and stirred frequently; otherwise the cement will settle to the bottom. The paint will dry in about six hours, and turns water very effectively. It is adapted for outside use and on old weather-beaten surfaces. It does not give a very glossy finish and should not be used where a specially neat job is desired.

A carload of Lodi cherries sold in Minneapolis for \$8,150.

SUTTER COUNTY CLAIMS PEACH PRODUCTION HONORS

Sutter County leads the state, and incidentally the world, in peach production, with Fresno County a close second, according to a report from C. E. Sullivan, county farm adviser, who has the figures for the half year ending June 1 from all parts of the United States. Sutter County export-

Five Million More Tires than last year

How much More Tire Economy

IT IS interesting to watch a car owner gradually becoming conscious of his tires. If his first tires don't give him what he has been led to expect, you will see him going back to the dealer for an allowance.

Finally he reaches the point where he prefers to shoulder his losses himself rather than argue the matter out with the dealer.

Meet him a year later and you will probably find him with two or three different makes of tires on his car.

* * *

There is less conviction in the minds of motorists about tires today than about any other subject connected with motoring.

The driver of the car in the foreground probably does not realize that by rounding the corner too quickly he may be taking as much as a thousand miles out of his rear tires.

A great deal of tire trouble can be avoided by slowing down to a reasonable speed in negotiating corners.

Despite all the claims, all the allowances, all the selling talks that are presented for the motorist's consideration, he goes along in his own way, seeking the tire that will give him the greatest economy.

Often you see him running foul of the irresponsible dealer.

But sooner or later he finds out that claims and allowances and selling talks can never take the place of performance.

* * *

More and more motorists are coming to realize that the

only way to tire economy is through *better tires*. Avoiding the dealer whose idea of business is merely to fill the eye or to supply a market and going direct to the *merchant who deals in quality*.

Never has the United States Rubber Company's policy of *quality first* been more thoroughly justified or widely appreciated than it is today.

Discounting, as it does, every temptation to force production in favor of a highly specialized, wholly standardized product.

* * *

Even when the production of U. S. Tires has reached two or three times its present figure, the test will still be not how many tires—but *how good*.

Q and A

About Threaded Rubber Insulation

This trade-mark is branded in red on one side of the Still Better Willard — the only storage battery with Threaded Rubber Insulation.

Q. What is Threaded Rubber Insulation?

A. A storage battery insulating material made up of rubber pierced with thousands of tiny threads.

Q. How does it differ from other battery insulation?

A. Ordinary insulation is wood, cut in the form of thin sheets, and is neither as uniform nor as durable as Threaded Rubber Insulation.

Q. Why is insulation so important?

A. Because battery life depends largely on insulation and because any defect or weakness of insulation is quickly evidenced by buckled plates, short circuits, failure of the battery to hold its charge and so on.

Q. What has this insulation to do with battery shipment?

A. The kind of insulation determines whether the battery must be kept wet, or can be shipped in "bone dry" condition. Wood insulation must never be allowed to dry out, hence makes necessary wet or partially wet shipment. With Threaded Rubber Insulation the battery can be shipped absolutely "bone dry."

Q. Why is "bonedry" shipment and stocking preferable?

A. Because it is the only method by which chemical action in the battery can be entirely held up, so that the battery reaches the buyer in truly brand-new condition.

Q. Why does wood insulation need to be replaced?

A. Because wood insulation being soft, wears out more rapidly than any other part of the battery. It is also subject to cracking and checking, which, if allowed to go too far, seriously damages the battery.

Q. Why does Threaded Rubber Insulation outlast the battery?

A. Because the basis is hard rubber which resists wear and does not crack or check.

Q. How can I be sure my battery has Threaded Rubber Insulation?

A. Look for the red Thread-Rubber trade-mark. It can be found only on the Still Better Willard Battery.

Q. How many car and truck manufacturers have selected Threaded Rubber Insulation?

A. 136 in all. The complete list is printed at the right.

One Dollar Yearly

Practical Growing of Oranges

By Peter Ting

IN order to make a practical success of orange growing one must at least have an inherent love for trees and for work among them. Without this work becomes a drudgery, and not much is accomplished in that way.

The growing of oranges might be divided into four essential parts: cultivation, irrigation, fertilization and pruning. To this might be added good, warm and well drained land and trees coming from good bearing stock.

Cultivation

In regard to cultivation, I believe the soil should be well plowed in the fall, if possible, for in the fall before rains come you can set your plow any depth; also, if you plow under manure or straw it is best done in the fall so that it will be well rotted in the spring. If the weeds should come up during the winter light randalling can be resorted to in the spring and the land put in good shape. If a cover crop is raised in the winter it should be turned under, if possible, in March or at least by April 10 to get the land in proper condition. Most orange growers have more acreage than they can properly care for in the short time allotted them in the spring. Leaving heavy vegetation until later, or the ground hard, will soon tell on the trees, giving them a pale cast, and of course they would be in no condition to bear the best crops. Cultivation with a chisel tooth cultivator or something just as good should be carried on all summer. We cultivate three times between irrigations. First, we harrow about ten days after water has been taken off. This varies with different soils. Five days later we cultivate lightly in squares, then diagonally, then six days later we do the main cultivating. By having the teeth good and sharp it will do fine work at this time.

I always tell my man not to cultivate until the land seems too dry. In that way we can get a nice pulverized mulch for the top layer. If cultivated wet the soil will roll in little lumps and in a few days becomes as

hard as a rock, and the intentions of the worker work the wrong direction. Instead of holding the moisture the soil will dry out much sooner, besides doing an injury to the soil.

Irrigation
In an ordinary year when there is plenty of water I think the first of May early enough for the first irrigation. Of course, where water is scarce irrigating should start so that it will be finished by the fore part of May. The furrowing should be done with a tool that will cut the plow sole. In most soils four furrows should be enough. Among some of our old trees we make only two with good results. Where the ground is steep the zigzag, around the trees is the system we use, making all the furrows serpentine. On heavy soils we run the water about 60 hours. On the light or granite soil, that is very porous, we start off with a large flow until the water nearly reaches the end and then cut down to the desired stream, filling the furrows in again if necessary and leave the water on about 36 hours. Where the trees are large and the zigzag method is not used on account of the slope, the water should be cut in between the trees on the lower rows. Care must be taken always that streams do not flow too fast or too slow or bad results will follow. If the water goes too fast the trees will suffer for want of moisture; if too slow, in time these trees will suffer from root injuries, especially if this happens on the same row, and this is likely to be the case. We irrigate about once in five weeks with a half inch of water to the acre, although we have gone as long as seven weeks in July and August between irrigations without noticeable injury. I think this can only be done where the

soil is well tilled and has a reserve water stock deep in the soil. About this reserve I will say more later.

Fertilizing

Then comes the matter of fertilizing. Fertilizing is not quite so important when the trees are young. One can take an orange tree, stick it in the ground and give it plenty of water and it will do fairly well for several years and sometimes, in odd years, may do better than well cultivated trees. This has bewildered a good many novices in the orange business because they immediately come to the conclusion that the orange tree will not need much care or fertilizing, but let them wait ten or 12 years until the soil becomes exhausted, then the trees go back all at once and everything is blamed but the proper source. Some even go so far as to bud their trees over. Fertilizing should start at least when trees are six or seven years old. Always keep ahead of the trees by building up the soil humus, either in cover crops, straw or stable manure. It appears from my experience that humus and nitrogen are most essential in our soils. We have used from three to 15 pounds of commercial fertilizer, according to grade, per old tree. The soil always should have a reserve of fertilizer and should never be on the ragged edge of want. The trees are not gluttons and they will not take any more than they need if you give them a balanced fertilizer. Trees that have this reserve can withstand any crisis that comes along, whether it be shortage of water or a hot wave, much better, and there is no need to worry much about the June drop. If we have all these conditions, with a fine mulch of four or five inches deep on top, you can hardly beat it as a preventive for June drop.

Pruning

Now, in regard to pruning I believe in being moderate and in not following every fad that comes and using this or that system indiscriminately. It may be perfectly right to prune run down orchards severely to build up new wood, but that does not mean that a neighbor with a healthy orchard should do the same thing.

I am not quite as much afraid of the orange tree sucker growth as some of the growers. I know that my old trees were built on sucker wood and they are now 25 years old and still look vigorous and bear heavy first grade fruit. Of course, it is barely possible that they could have been better if they had been built more upon fruit wood. I do not let my young trees grow that way now, because it makes weaker trees. The last heavy crop we had, in 1916, 20 per cent of my trees had broken limbs, but they had a crop of between 11,000 and 12,000 boxes on 14 acres. I believe now in taking out the rank sucker growth, also dead and weak wood, and where the trees are too dense cutting out some of the healthy wood to open up a tree and let in light and air. Trees up to a certain age will bear most of the fruit on the outside. Later, as the wood becomes older and the tree more open, most of the fruit will grow on the inside. Suckers, say about eight inches to a foot long, are to be left about a foot apart. Anything that you are forced to cut back had better be taken out entirely, since the fruit nearly always grows on the end of the twigs.

Drainage

Last, but not least, is the drainage, or the lack of drainage. It is one of the hardest things to overcome, so in getting orange land it is well to get land on a gentle slope and thereby overcome the lack of drainage.

To close with, I can say that experience has taught me that good results can be obtained on adobe or granite soil by methods that I have outlined here to you and which I have followed.

Raisins to Throw Away

By Fred K. Howard

BACK in the pre-association days when raisins were cheap a statement of this sort would have caused no comment in the raisin growing districts. In those days it cost more to harvest and cure the crop than the raisins were worth, to say nothing of the additional cost of pruning, irrigating and cultivating, and such other incidental items as interest, taxes, insurance and labor income were unthought of when figuring the net loss for the year.

But who would throw away raisins today when they are worth ten cents a pound or better to the grower? Who? Why, Mr. Raisin Grower, the only man who has any raisins to dispose of in this manner. But, you ask, how can the raisin grower do such a thing? Simply by picking the fruit too green.

An unqualified statement of this sort would not go unchallenged, so let us determine just how many pounds of fruit the grower can actually throw away and not realize he has lost anything. To make a pound of Muscat raisins it requires 4½ pounds of fresh grapes testing 19 per cent sugar, while if the fruit is left on the vines until it tests 24 per cent sugar it will take only approximately 3½ pounds of fresh fruit. In addition the fresh fruit actually increases in weight while it is on the vine.

In the drying process alone the grower loses 25 pounds of raisins on each ton of fresh fruit for every degree of sugar loss due to early picking. Mental gymnastics—read it over

again and be sure you get the full meaning. Now let's figure some more. The average production of Muscats is perhaps about 9,000 pounds of fresh fruit per acre. If the picking is done when these grapes test 19 per cent sugar, when the drying is finished we will have about 2,000 pounds of fruit which some people call raisins. If the picking is delayed until the fruit tests 24 per cent sugar the same tonnage fresh will, when dried, make in round figures 2,570 pounds of real honest to goodness raisins, an increase of 570 pounds of sugar per acre in the form of raisins which the grower will be proud to deliver and which are worth ten cents or better per pound. And in addition we have yet to con-

sider the increase in weight of the fresh fruit while on the vine, which would crowd this figure up to around \$75 or \$80 per acre.

Of course, if the production of the vineyard is above the average the loss from picking too green will be correspondingly greater, but remember that approximately 25 pounds of raisins are lost on each ton of fresh fruit for every degree of sugar less than 24 per cent, plus the loss in weight in the fresh fruit.

The natural question in view of these facts is: why do some growers throw away this large amount of raisins each year?

There is an answer, or rather there are three answers. First, and perhaps foremost, is the labor situation. The grower usually finds it necessary to
(Continued on Page 75.)

Agricultural News Notes of the Pacific Coast

Northern California

Napa County reports some cherries going to the canneries at as low as four cents.

R. P. McCune of Wyandotte is the new president of the Butte County farm bureau.

The new cannery at San Leandro, Alameda County, celebrated its opening on July 10.

The Sonoma Valley Cooperative Poultry Association has filed articles of incorporation.

The Butte County Farm News reports many septic tanks being constructed this year.

Some wine grape growers of Sutter County report contracts for wine grapes at \$50 per ton.

Lawrence Taylor is aiding in Shasta County farm bureau work during the sickness of Adviser Talbot.

Berry growers of Paradise Valley, Butte County, are organizing cooperative marketing association.

It is now proposed to make the Sacramento navigable farther up stream with a series of dams and locks.

Sutter County reports 5,000 acres of cling peaches in bearing. Of this the largest acreage is set to Tuscans.

An irrigation company of Eldorado County has been authorized by the state railroad commission to increase its rates.

Sutter Basin anticipates bumper crop of potatoes. The Sutter Basin Company alone will harvest more than 60,000 sacks.

Farmers of Siskiyou County are taking steps for the organization of an irrigating district, which proposes to secure water to cover at least 150,000 acres.

San Mateo County, the biggest grower of Globe artichokes in the state, reports a new pest, the larva of some moth, which is causing serious losses to growers.

Farm center meetings in Placer County have been suspended for the summer months owing to the heavy work of the fruit harvest and the difficulty of securing labor.

The directors of the Pacific Rice Growers recently held a meeting in Sacramento to discuss the disposal of the coming crop and the question of water sufficient to mature it.

Yuba County's first car of pears was from the Howard Reed orchard near Marysville. The Reed orchard will produce about 2,000 tons of Bartletts. One hundred men are now at work in the harvest.

R. L. Nougaret, in charge of the office of viticulture, has been visiting the Cloverdale section of Sonoma County to look over the "green grafting" which has been done recently on grape vines in that section.

Directors of the Butte County farm bureau have demanded rigid enforcement of the state law requiring that all those who make a business of spraying fruit trees obtain a license from the county horticultural commissioner.

The gas shortage which has affected the whole state has been especially stringent in Sacramento City and nearly all points north. The shortage has affected the farmers who are using power less seriously than pleasure automobiles.

Central California

Kern County cotton is making fine progress and there is a good deal of it.

Citrus growers are planning for the greatest campaign yet on the citricola or gray scale.

The Madera County farm bureau is working on large exhibit to be made at the coming state fair.

Santa Clara Valley is harvesting apricots. The cooperative cannery will handle at least 2,000 tons.

Lindsay orange groves are showing unusually heavy June drop because of extremely hot two days in June.

Nearly 200 growers attended the sessions of the plant pathological congress held at Porterville June 26.

Secretary Paine of the state fair association recently addressed people of Salinas, urging exhibit at the coming fair.

The weather station at Fresno chronicles 110 degrees for June 20, which is the highest June temperature since 1911.

Nearly all counties in the central part of the state are joining in the campaign to secure new series of state road bonds with an increased rate of interest.

At Shafter, Kern County, one field of potatoes produced 136 sacks to the acre. This fine crop was produced in spite of this year's unfavorable weather conditions.

Effort is being made to call a convention of citrus fruit workers to be held in Fresno in September. There are said to be about 3,000 members of this organization.

The state railway commission has granted the P. G. and E. and Sierra and San Francisco Light and Power Company a 15 per cent surcharge during the present season.

Recently 23 Kern County grammar school boys finished a pig feeding contest. The boys made some fine records, some producing pork at a cost of 9.25 to 10.7 cents per pound of gain.

Fig growers are active in the organization of a marketing association. President Niswander of the Peach Growers reports: "Results to date show splendid effort on the part of solicitors."

Field Entomologist Urbahn of the United States department of agriculture is in the Watsonville apple district urging growers to assure sound fruit by spraying at the proper time to destroy codling worm.

Santa Clara County fig growers met recently with peach growers of the valley to discuss merger of the fig and peach associations. More than half of the fig growers of the county are reported to have already signed up with the association.

A mass meeting of olive growers was held at Lindsay, Tulare County, the last week in June to complete arrangements for change of membership from the California Associated Olive Growers to the Associated Olive Growers of California.

Work on the first dehydrating plant in the Pajaro Valley started recently. The plant is being erected for the Corralitos Fruit Growers Association beside its packing house. The dehydrator will have four kilns built of concrete and lined with fire brick. The outside walls are of hollow tile.

Southern California

The marmalade factory at Anaheim has closed for the season.

Palo Verde, Riverside County, is predicting a 15,000 bale crop of cotton.

The cannery at Arlington, Riverside County, is running full handed on apricots.

Ventura County farm bureau is making a strong campaign for fire prevention.

Riverside orange growers recently met at Fairmont and discussed frost protection.

Perris, Riverside County, is planning to make an exhibit at the Southern California fair.

A large number of Redlands high school girls are helping in the Hemet apricot orchards and dry yards.

Dr. D. S. Cox is the new farm adviser for San Bernardino County. He has just arrived from Cornell University.

The citrus center of the Riverside County farm bureau is planning a demonstration of treatment for gophered trees.

Growing crops of Limas and Baby Limas are reported looking exceedingly well in all sections of Southern California.

Fumigation school will be held at Pomona high school, July 23. There will be demonstrations of both fumigating and spraying outfits.

Walnut growers of the San Fernando Valley are planning building warehouse at Lankershim. It will be of brick and 60 by 80 feet in size.

The Alfalfa Growers of California find the crop of alfalfa hay will be materially lessened over earlier estimates. Prices are ranging around \$40 f. o. b.

Many potato growers of Southern California are finding a serious situation in the growth of immense tops but no tubers. No remedy is yet discovered.

During the last few weeks farmers in many parts of San Bernardino County have been restricted in their use of electric power to pumping for irrigation only.

On July 23, at Pomona high school, the third annual citrus growers' fumigation and spraying school will be held under the auspices of the Los Angeles County farm bureau.

At the meeting of the California Citrus Institute at Santa Ana members pledged themselves to support a bill preventing wastage of water from flowing wells in the lowlands of Orange and Los Angeles Counties.

The Imperial Valley farm bureau recently staged a trip through the Arizona Pima cotton producing centers and has returned many of its members enthusiastic for planting more largely to Pima in the Imperial.

A campaign has just been concluded in San Diego County against the grasshopper pest. County Horticultural Commissioner Gorton and D. B. Mackie of the state department of agriculture have been directing the campaign.

The California Lima Bean Growers Association has just completed careful survey of acreage planted this season to Limas and Baby Limas and finds the total for Southern California to be 149,837 acres of which the association controls 78,804.

The Coast and General

There are 87,809 autos registered in Oregon.

Southwest Washington Fair will be held at Centralia August 23-28.

The Eugene, Oregon, fruit cannery is running full handed on gooseberries.

Tacoma, Washington, reports heavy advance in egg prices due to demand from Alaska.

The annual picnic of the Oregon Duroc Breeders Association was recently held at Salem.

Several large woolen mills of Massachusetts have closed because of shrinkage of orders.

Berry growers at Raymond, Washington, report \$1,200 per acre profit from this season's crops.

Washington County, Oregon, Holstein Breeders Association recently held a cattle judging contest.

The first full car of butter out of Eastern Oregon was shipped from Baker in June, to Lewiston, Idaho.

Cherry shippers of the Wenatchee district of Washington are calling for more adequate supplies of express cars.

Pierce County, Washington, has organized a honey producers association. Marketing at better advantage is the object.

The state legislature of Washington is sending an immigration and naturalization committee to study California's Japanese problem.

Oregon agricultural experiment station and federal bureau of soils are working cooperatively in soil investigations in the Willamette Valley.

The Nevada Livestock Association has committee conferring with forest reserve officials, endeavoring to secure more satisfactory pasturage arrangement.

The highest test for butterfat made in cow testing associations of Oregon for the month of April was by Mabel, a grade Jersey owned by J. Nulf of Bandon. She produced 105.18 pounds of butterfat.

Deer Park, Washington, fought off May frosts by liberal smudging and the orchards thus protected now show much larger crops than those not smudged. The campaign was kept up for 12 days.

Foresters of the Hawaiian Islands are appealing for greatest care in preventing fires because of the protracted dry spell which has prevailed over the island. No permits are being issued for any camp fires.

The Gila Indian reservation in Arizona, comprising some 50,000 acres of land, is being benefited by a power line which will enable more liberal pumping and irrigation. A half million dollars is being invested in the installation.

Berry growers of the Bellingham district of Washington say that they will need within a few days 1,000 to 1,500 berry pickers. Prices are practically double those of 1919 and some firms are offering a bonus to pickers who stay through the season.

The dehydration plant at Salem, Oregon, is running on spinach. Later, strawberries and cherries will be handled through the same evaporator. The owners anticipate handling at least \$2,000,000 worth of products through the plant this season.

Orchard Tractors Save Money

By J. E. Calkins

THE orchard tractor, as we now know it in the California citrus groves, is not only giving deeper and more thorough cultivation to the land on which it is being used than teams gave before it came, but it is largely superseding two items of grove labor that used to be large, and thereby working quite a saving to the grove owner.

In a great many groves during the past spring it replaced the plow with the orchard disk. Till very recently, except in certain neighborhoods with peculiar soils, it was thought that plowing, often deep plowing, was necessary if there was to be a good dust mulch, but on unnumbered groves through the best part of the citrus belt no plowing was done this year. For one thing, there is less disposition to tear up the root system than there formerly was, and for another thing there is less man power to do the plowing. The cut-away disk of good width, well loaded down, is worked on groves whose owners used to think they were ruined if they did not get a good plowing and often plowing two ways. The tractor rolled down the cover crop, of whatever height and density, with no trouble, and chopped it up, and at the same time stirred it into the soil to a depth of several inches with equal ease and in decidedly less time than was formerly spent on plowing. The soil was worked to a finer state of division; cover and fertilizer were more thoroughly worked into it; the top layer of earth was effectually loosened and at the same time kept compact against evaporation so that the moisture in the ground was better retained; and the bane of the irrigator, the first run of water, was as easily handled as any other. There are still men who cling to the old method of thorough plowing, as there are men who hate automobiles

and still love to drive a horse, and there are places and cases, without doubt, where it is needed, but the engine drawn disk seems to have largely crowded it out. So far most of the ranchers who have come to the new method express themselves as confident of better results than the old time plowing gave.

In the next place, much of the former labor of hoeing out under the trees in these groves has been eliminated, with proportionate saving of cost to the owner. The best team drawn cultivator did not cut very wide if it worked deep. It brushed past the outer rim of the trees but did not have breadth enough to get far underneath them. If it was made wide enough to reach far under the trees it was not able to work very deep because of overload to the team. So it naturally happened that the soil well under the trees was not worked, and the careful rancher felt that it was necessary to hire men to break this up with the spading fork, or at the very least to hoe out the weeds and grass that sprang up in the shade of the tree out of reach of the team tools. At the former prices of labor this hand work easily ran to quite a sum per acre where the trees were large, and at the present prices the cost appears almost prohibitive, and probably the needed help at any price would be hard to get.

The tractor has worked a notable change in this state of affairs. Its greatly increased power enables it to pull an implement with a much greater width and at the same time thrust it well down, so that with work as deep as the team ever did it also accomplishes work a great deal wider. This makes it possible to extend a low built cultivator, equipped with efficient shields which enable it to glide under

the low branches without doing damage to them, so that it cuts far under the trees, giving good cultivation to the soil that was formerly missed and greatly reducing the area on which weeds might grow and on which hand labor might be required, and which was never irrigated or stirred.

Beyond the two advantages named, whereby the tractor gains over the team, there is another which is of equal or greater importance though it does not operate to cut cost; on the other hand it probably causes some increase of cost; but it plainly brings returns that more than make up for it. The part of the average orange or lemon orchard that is most responsive to irrigation, takes water best, holds it longest, and does the most good with it, is the part that is hidden under the trees. Evaporation is slowest and smallest there, and the soil thus shaded is far more absorbent than that which lies outside in the open air and sunshine. With teams it was not possible to effectively cultivate under the trees, so the careful rancher, having the fear of gum disease before his eyes, has been very particular not to let his irrigating furrows wander under them where the ground could not be stirred and has tried to keep the water from breaking out of his furrows and spreading in these out of the way places. The area of the grove that could be watered, fertilized and worked corresponded with the area that could be reached with the narrow team implement. As the trees grew larger the area that could not be handled grew larger, each tree taking in more territory and retiring it from cultivation, and the portion of the land that could be worked grew smaller. In the largest, oldest groves the space that was workable was so far cut down, unless trees were

pruned high to allow work to be done under them, that it was only a mere fraction of the area that was tilled at the time that grove began to bear; yet people wondered why the older groves became so rapidly decadent and so soon reached a stage when they gave but small return.

The wider working tractor implement, cutting deep into the ground and stirring it thoroughly, under the trees as well as in the open space between the rows, has made a great change in the form and condition of such groves. Where the proper implements have been provided, properly shielded to avoid tree damage and intelligently handled, it is safe to say the tillable surface has been increased from 50 to 100 per cent and the land thus gained is that which is most responsive to cultivation. Twice as much water goes down into the ground in a furrow drawn close to the trunks of trees that spread wide and shade large spaces as goes down in the open air furrow by its side, and the spread of that water underground is far greater. It lingers longer in the soil, and it seems plain from the showing that the grove thus treated makes, it does the tree vastly more good than the water that slowly penetrates in a furrow that lies out in the broiling sun that orange growing demands. The tractor alone has made it possible to put the water under the trees easily and cheaply, and then to cultivate after it efficiently, and the improvement that comes from this single feature of tractor work in the grove leads observant growers to say that this one benefit alone, if there were no other, would forbid them returning to team work and discarding the tractor. It may take the test of years to fully indicate what this under-tree working is really worth and what its drawbacks are, but at the present the advantage seems to be all on its side.

Standard Apple Act of 1917

By S. V. Christerson, Standardization Inspector,
State Department of Agriculture

THE interpretation of a statute is frequently difficult to the average layman, and the Standard Apple Act of 1917, although written by apple growers, shippers and packers for the use and protection of the industry, has proved no exception to this rule. In order to obtain a clearer understanding of the purposes and requirements of this law by the apple interests, the office of standardization of the state department of agriculture, directly in charge of the enforcement of this act, has prepared the following article for publication:

Three Grades

The standard apple act of 1917 establishes three grades for apples packed, delivered for shipment, offered for sale, or sold in California.

The California Fancy grade shall contain only nearly perfect apples. The fruit placed in this grade must be well grown, hand picked, properly matured specimens of one variety. With the exception of Gravensteins, stems must be retained and the fruit be well colored and shaped for the locality in which grown; uniform in size, which means that the variation in size between the apples must not exceed three-eighths of one inch; two and one-fourth inches is the minimum di-

ameter for apples in the California Fancy grade, although Winesaps and Lady apples not smaller than two inches may be packed. Apples when packed in this grade must be free from insect pests and diseases, visible rot, dry rot or Baldwin spots, insect bites, bruises and other defects. A tolerance of three per cent for any one defect and ten per cent for total defects is permitted from this standard.

The B grade was established to take care of apples which in certain minor requirements were not of sufficient perfection to be placed in the California Fancy grade. Apples in the B grade must conform virtually to the standards established for the California Fancy, with the exception that those that are somewhat misshapen and those which show insect bites that have healed in the process of maturing, as well as the ones on which the stems have not been retained, may be packed. In the B grade slightly frost marked or sunburned apples are permitted. No minimum size has been established for the B grade, but the variation between the individual fruit

in one container must not exceed three-eighths of one inch.

The C grade is practically a cull grade. Apples packed under this grade do not have to be well grown, hand picked, retain the stems, well colored and normally shaped for variety and locality; uniform in size, well packed, free from insect bites, bruises, frost marks, sunburn and other defects, and may be dirty. In other words, the only requirements made for this grade are that the apples must be mature, of one variety, free from insect pests, diseases, visible rot, dry rot, and Baldwin spot.

Boxes

The standard apple act of 1917, as amended in 1919, establishes the Northwestern standard apple box as the California standard. This box has the following dimensions, inside measurements: 10½ inches by 11½ inches by 18 inches, with cubical contents of approximately 2,173½ cubic inches. Other boxes for the packing of apples may be employed, such as the old California box, pear boxes, etc., provided each packed container bears the legend, "Irregular Container," in let-

ters not less than one-half inch, or 36 point type. In order to identify and distinguish apple containers, the following markings must appear on each box:

Grade, California Fancy, B, or C.
Number in box or net weight.
Variety.
Name and address of packer.
Date when packed or repacked.

If the number of apples is marked on the outside of the container a variation of five apples, more or less than the number stated, is allowed. If the variety is unknown to the packer, the legend "Variety Unknown" must appear in lieu of the name of the variety. The law does not require the tier marking of the container. A number of apple growers throughout the state are still in the habit of marking 3½ tiers, 4 tiers, 4½ tiers, etc. on the container. Although these terms are clearly defined by law, there seems to be a preference, particularly with the Eastern trade, to have the number of apples marked on the box which in itself indicates the size. This is the real purpose of marking the number of tiers on the outside of the container. The Western Fruit Jobbers Convention, at their last meeting in San Francisco this spring, adopted a uniform schedule of the number of apples to be contained within certain

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

A scene typical of thousands in California is shown on the cover this week. It is on Conejo Ranch in extreme southwestern Ventura County, in fact, Los Angeles County almost claims this section.

In a few days the scene shown will be materially changed for the reason that it will be filled with seats and auctioneer's box and some of Conejo's Duroc-Jerseys and Hampshires will there be sold to highest bidders. The auction method of disposing of pure bred stock is increasing in favor, and justly, for it brings together buyer and seller and gives the buyer opportunity of judging not only with his own eyes but with the eyes of the expert animal breeder.

BETTER EQUIPMENT

A great event which will aid the farmer and fruit grower to gather a fund of information in farm power, farm implements and machinery is the first National Tractor and Implement Show at Los Angeles. The Southern California Tractor and Implement Dealers Association, or, rather, the National Association, will gather in the Verdugo Woodlands in the city of Glendale, within a few minutes of the center of Los Angeles, an exhibit of

farm power, implements, machinery, equipment and household conveniences which will enable one to procure a liberal education in up to date farm equipment.

THE IRRIGATION CASE

Decision in the case in which the delta users of Sacramento River waters are plaintiffs and irrigators of Glenn, Colusa and other upper river counties are defendants has been delayed by change of venue. It was to have been decided at Martinez on the 12th, but the motion for change of venue will cause a delay before the injunction proceedings can be reached.

It appears that the result must be loss of millions whichever way the decision. However, it is to be hoped that some solution will be found, through employing dams, locks, or some other means which will provide sufficient water for all.

OUTLOOK NOT BRIGHT

In the review of general business and agricultural conditions of the twelfth federal reserve district the reserve bank reports 33,925 hogs received this year, as compared with 52,578 last year, at the public yards at Portland, Salt Lake, Seattle, Spokane and Tacoma. Receipts of cattle were practically the same, while those of sheep were slightly greater. As to sheep, the bank reports:

"Normally most of the clip would now be under contract, but this year buyers have not entered the market and practically none of the 1920 clip has been sold. Cancellation of orders at Eastern mills and transportation difficulties are assigned as reasons for failure to move the clip."

Some farm productions may be still advancing—for instance, barley—but the livestock man isn't finding the outlook especially attractive at this moment.

MANY MINDS

Many men meeting together and discussing California cultural problems afford wonderful diversion for the onlooker who is not vitally concerned in the solution of the problems. But the one who wants the one complete and final answer leaves a congress or institute or farm bureau meeting hopelessly floundering.

The final answer is not to be had. The royal road to mental achievement does not yet exist. Successful farming, especially irrigated farming and orcharding in California is—mind we do not say requires, but is—mental achievement.

Today we stood in a citrus orchard, 20 year old trees. The soil surface was covered with dead and brown foxtail, malva and other winter growth, so that one sank into it ankle deep. Irrigating water was struggling through weed filled and tortuous furrows made some months ago. Bermuda and other grasses, even abundance of Johnson grass, were growing luxuriantly.

Horrible!

It was really horrible, a nightmare, to the tidy, painstaking orchardist.

But note! The tree leaves were large, dark green and rich. Not a chlorosis leaf to be found. Health manifested by every tree. Better than all, trees—all of them—loaded with fruit. We would wager the office shears on a thousand boxes per acre. Big plump fruit that June drop will not affect this year. The owner's home filled with comforts and luxuries. The owner and husky sons caring for more than a hundred acres

of orchard. No Oriental nor practically any other labor employed. More horse sense than horse labor used on the ranch.

"Does the California Cultivator advise other citrus orchardists to follow the same methods?"

Heavens, No!

Still—we can't help but think—that fellow's making money.

What is success, anyhow?

STATE MARKETS

Senator William E. Brown and the Producers and Consumers League of California are pushing initiative petitions asking for the establishment of state commission markets, the principal feature of which shall be, as expressed by the proposed act:

"To foster and encourage cooperation between producers and consumers of any such products, in the interest of the general public of the state of California, and in addition thereto to improve, broaden and extend in every practical way the distribution and sale of any such California products throughout the world." Other points as expressed in the proposed act are to gather and disseminate information and to carry on the business of receiving from the producers the agricultural, fishery, dairy and farm products of the state, and selling and the same on commission as herein provided.

Senator Brown writes:

"State commission markets will assure and maintain open avenues between the producer and consumer and will permit the law of demand and supply to genuinely operate without artificial manipulation. This insures a square deal to all concerned."

HIGHWAY BONDS

A Kings County fruit producer recently remarked that a few years ago he could not deliver fruit from his ranch—which was some miles from the packing house—without at least a half of it becoming unmarketable because of the jolting in transit. Today in a fourth of the time he takes twice the quantity to the packing house and it arrives 100 per cent to the good. Good roads—and incidentally, gasoline and better springs—have brought this about. But the best of springs will not overcome the chuck holes of a poor road. These advantages have been recognized by the voters of California, and millions have been voted to increase the mileage.

A few of the millions have been available, but changing financial conditions have made further disposal of the bonds impossible. At one time four or four and a half per cent would get all the money the state or nation needed. When the price began to rise, different counties aided the state by shouldering the difference between market and state bonds. The situation continued to get worse, or the money lender would say, better, until the counties were unable to shoulder the burden. Road building has ceased, or soon will cease.

However, the people of California cannot and will not tolerate a step backward in the building of good roads. Too much of our prosperity depends upon them. Everybody has been busy during the past week signing and circulating petitions for initiative measure for the recall of the former bond issue, or that portion which has not been sold, and the release of other bonds to bear a rate of interest which will make them salable, not exceeding six per cent, this to be voted upon at the election on November 7. The original petitions were to be all filed by last Thursday, but supplemental petitions may still be filed.

OFF AG'IN—ON AG'IN

"Have you had your daily allowance of gas?" has become the usual morning salutation. The regular morning exercise now is to get in line and secure your little one to three gallon allowance. Usually the tail of the line is caught with nothing but air. The Pomona Progress suggests that it is a case of "Off ag'in, on ag'in, gone ag'in, Gasoline."

HELPING MEN

"The main purpose is to help in the solution of the land problems of the future." This is a statement in the opening chapter of Prof. Elwood Mead's "Helping Men Own Farms." Nor is there any discrepancy between this statement of purpose and the title of the book. Dr. Mead is nothing if not a seer of the larger things of the future. He is looking to the betterment of national life; he is looking to patriotic service; and he is seeing a hungry world unless home owning is made more attractive than tenantry. The two first words of the title, "Helping Men," appear on every page of the book. Dr. Mead is well aware that as the man, so the nation.

Dr. Mead has spent his life in studying the question of economics and especially the question of land tenantry. Nearly a score of years ago he was called to Australia to aid in the solution of an irrigation problem. The state of Victoria had installed a great irrigation system; there was water in abundance, running in great canals through large estates. The use of the water did not appeal to these large land holders, so the greater portion of the irrigation waters wasted. How could these waters be used on these lands so as to increase Australia's wealth and citizenship?

Dr. Mead studied the problem, then the methods of handling land tenancy in Italy, Denmark, Holland and the British Isles. Later the great Australian holdings were broken up under Dr. Mead's direction, and the benefits of that work were such that California reached out and brought him back to America. In this state he has brought about land settlements which are the pioneers in all America.

The greater part of the book is given to these settlements in California, to a discussion of the problems they have created and to the problems they have helped in solving. We believe this book will materially aid in the solution of the food problem. With a large part of the world hungry and the larger part which will be hungry within the next few years unless tenancy and ownership problems are solved, Dr. Mead's book is timely and we believe will materially aid in the solution of some of these far reaching questions.

"In California, as in other American states, rivers need to be conserved and forests saved from the devastation of ax and fire. The fertile soil of hillside farms needs to be saved from the destructive effects of erosion. Agriculture which impairs soil fertility must be discredited. In the arid states the relative rights of irrigation and power should be ascertained and defined; a definite plan of future development should be prepared. Real estate tax laws based on unimproved values with a higher rate for great estates and those held by non-residents would help to break up large holdings, increase the rural population and forestall more radical remedies. Such restrictions should be placed on tenure as will prevent the holding of great areas of land by non-residents. More effective laws are needed to protect rural civilization from the impending menace of alien ownership. What has been accomplished is only a germ of the things that ought to be done to make rural life a real social and industrial democracy."

More extended notice of this book will be given in the next issue of the California Cultivator.

Top Working Orange Trees

By Ernest Branton

ON THE Huntington Ranch at San Marino, Los Angeles County, 3,513 old Navel oranges have been top-worked to Valencias since 1916. The reasons for this change were three: that district is better adapted to Valencias than to Navels, in both climate and soil; prices for Valencias from the district are better than those for the local Navels; the district is cold (in the lowlands) and the Valencia is the hardier of the two. In 1916 there were 1,190 old Navels budded to Valencias at a height of four to five feet. The work was done in June and July. The buds were large ones and were inserted in the old wood. About five weeks after budding the trees were ring-barked just above the buds. The trunks below the buds were then whitewashed and the old tops cut away at con-

previous year, so Mr. Hertrich changed his methods.

In March, 1919, he cut back 1,630 Navels, immediately whitewashed them and budded in the new shoots that grew up, in October and November. This proved very successful for the buds lay dormant until early in the spring of 1920 and then started into growth with the first pulsation of the growing season. Now the orchard presents a very interesting and attractive sight and material for study. The old trees were cut off at five feet high. No fertilizer is given these trees this year for there is as yet nothing needing much food. A good cover crop was grown and turned under to keep the soil in good condition.

All this work and results were "prosy" and matter of fact and but one item of unusual interest developed.

Topworked Trees at San Marino

On left Navel cut back in March, 1919 and budded in new wood in October. On right a four year Valencia top, budded on Navel in June, 1916.

venience. When the orchard had been cleaned up the trunks were again whitewashed. William Hertrich, the superintendent, considers it necessary to whitewash before cutting away tops and says many topworkers lose through lack of this precaution.

Enter Certified Buds

In 1917 agitation was rife for certified or "pedigreed" buds and Mr. Hertrich had these placed in 693 trees, the work in all other ways being similar to that of the year previous. But the certified buds were small and would not take as readily in the old bark as did the larger buds used the

Some trees of those budded in the old wood were entirely shorn of the top while others had one or more small branches left to keep the sap going and the trees somewhat active. A freeze came and many of those that were dormant or without any top were killed, even those six inches in trunk diameter. None of those that were functioning through having a small branch left on were killed. These 3,500 trees are all Mr. Hertrich has worked over from Navels to Valencias but he is working over and will continue to work over the non-productive or drone trees with buds from the very best types obtainable.

Violations of Fresh Fruit and Vegetable Law

F. W. Read of the state department of agriculture writes:

"Now that the shipping season for deciduous fruits is well under way it is felt that the horticultural commissioners should caution all inspectors to be absolutely sure of their ground before rejection proceedings are instituted.

"The long list of violations reported by the county horticultural commissioners during the past two weeks only serves to emphasize the fact that we must proceed carefully in the exercise of the authority which the law delegates to us. Nothing will bring the standardization service into greater disrepute than condemnations on pure technicalities. In this office we stand for a commercial interpretation of the law. This does not mean that it is our desire to have the horticultural commissioners and their inspectors relax their vigilance in the matter of prosecuting offenders, for it is felt that the success of the fruit and vegetable industry of the state depends in a large measure upon the proper enforcement of the standardization laws, but we also feel that each case should

be considered carefully on its merits.

When reporting violations of the fresh fruit and vegetable standardization law on the forms provided for that purpose, the exact disposition of the condemned fruit should in all cases be included, although no particular space is provided for this information on the blank. If the goods are sent to a by-products factory give the name of such factory, if possible. Inspectors should not use "condemned" on report, as this is very difficult of interpretation; rather say "dumped," "destroyed," "returned to shipper," "sent to by-products factory," "marked," etc. When mention is made of the cause of condemnation, such as "cracked," as in the case of plums, "wormy," in the case of apricots, etc., give the approximate percentage of defect.

The pinto bean growers of New Mexico have earned \$82,000 in additional profits from their 1919 crop through their cooperative marketing association, initiated by specialists of the United States bureau of markets.

Sandstrom Tractor Scraper

An Ideal Scraper to Do Your Leveling

It is light draft and operated by driver from the tractor seat

Made in 3 Sizes for Small or Medium-Sized Tractors

Manufactured and Distributed by

B. SANDSTROM 1822 Nason Street, Alameda, Cal.

Grasses For Pasture

Now is the time to plant them. Once established they endure indefinitely

For Summer Pasture: Rhodes, Guinea, Para.

For Winter Pasture: Phalaris Stenoptara, Smilo, Paspalum Dilatatum

We offer plants of the following—prices postpaid:

	Per Doz.	Per 100	Per 1000
Napier—divided crowns	\$1.00	\$4.00	\$30.00
Guinea—divided crowns	1.00	4.00	
Smilo—divided crowns	.50	1.00	4.00
Phalaris Stenoptara—Plants	.50	1.00	4.00
Rhodes	.50	1.00	
Para—Stems	.50	1.00	4.00
Japanese Sugar Cane—Stems	1.00	4.00	

We offer seed of the following—which should be planted now:

	Price: Per Oz.	Per Lb.	10 Lbs.
Smilo	\$.50	\$3.00	\$25.00
Rhodes	.25	1.00	8.00
Paspalum Dilatatum	.25	1.00	8.00
Alfileria	.25	1.00	8.00
Orchard Grass		.75	6.00
Italian Rye		.50	4.00
Salt Bush		.75	6.00
Burr Clover		.75	6.00
Melilotus Alba		.75	6.00
Peruvian Alfalfa		.60	5.50

For a wind-break around your garden, plant Napier.

For further information on any of the above subjects, write

AGGELER & MUSSER SEED COMPANY

620 So. Spring St., Los Angeles, Cal.

Suppose It Should Rain August 5th?

In 1918 growers lost \$10,000,000 worth of prunes and grapes through early rains. Perhaps you sustained part of this loss.

Insure your future crops by buying a De-Hy-Dro Drier. Price \$1,000 complete. Built to hold 24 standard field trays three by eight feet. No fans or moving parts. Easy to operate. Portable. Dries one to three tons of green fruit in 24 hours. As a finisher or emergency drier in case of early rains, it handles many times this amount in a few hours.

With a De-Hy-Dro, your first year's gross profits will be two to three times the cost of the machine. Our factory is crowded. Don't delay. Order now to insure delivery.

Write today for descriptive folder.

THE DE-HY-DRO COMPANY

Main Office 609 Hearst Building, San Francisco

Factory 74 Tehama St., San Francisco

SANDERS DISC PLOWS

Used everywhere—all styles for orchard and field—one to eight discs, 24, 26 or 28 inches in diameter. Horse drawn or tractor pattern—power lift if wanted. Write for complete information, or call and see these plows when in the City.

STANDARD APPLE ACT OF 1917

(Continued from Page 69.)

tier markings; for instance, counts 64 to 88 to be classed as 3½ tier, counts 96 to 125 to be classed as 4 tier, counts 138 to 185 to be classed as 4½ tier, etc.

Diseased or Infested Fruit

A great deal of confusion and comment has been caused by the misinterpretation of the provisions of section 5 with reference to apples infected with insect pests or diseases. This section provides clearly that no one may import, sell, barter, offer for sale, or have in his possession for sale any apples infected with any insect pests or the pupa or larva thereof, or any disease. It provides, further, for the disposition of apples of this quality and it should be understood that nothing in the standard apple act of 1917 prevents the grower from selling such infested or infected apples as part of his crop in bulk to the packer for the purpose of packing or to sell such apples to a by-products factory for the manufacture of such apple by-products as vinegar, cider, dried apples, etc. The question has been raised as to whether a housewife could purchase this fruit to make jelly or sauce, and if the retailer or peddler could sell it to her for such purpose. The office of standardization has maintained that it would lower the standards of California apples if such practice were permitted, but that growers could sell infested or infected apples direct to the consumer provided the consumer came to the ranch and purchased such infested or infected fruit in person. The argument in favor of a strict enforcement of this paragraph is: Should we permit the sale of cull apples in competition with well graded and packed apples, the consumer would not be benefited and the producer would suffer a financial loss because this poor grade of apples would naturally cause a decline in the sale of good, healthy fruit. There is no economy in buying decayed, diseased fruit, as it would be cheaper to buy apples which can be used in entirety than to have to remove such portions as are infested or infected. On the other hand, the chief argument for permitting the sale of diseased fruit has been that the grower should be allowed to dispose of his crop and the thousands of poor families in the large cities should be permitted to buy this low grade fruit. Section 5 provides a means of disposing of culls or diseased fruit, and poor families in the large cities can well afford to pay 50 cents or 75 cents more and get a box of C grade apples than to buy a box of wormy, diseased, decayed fruit.

State Stamps

The enforcement of this act has been provided for by authorizing the state director of agriculture to cause to be printed or lithographed stamps which indicate the grade of apples packed under the provisions of this act. At the present time two types of stamps are in use: one a rubber stamp bearing the impression "California Fancy," "B," or "C" grade, guaranteed by the packer under the standard apple act of 1917; the other a lithographed stamp about two and one-half inches square bearing the same legend, but affixed by means of mucilage to the container. Large packers prefer the rubber stamp, as it expedites the stamping of their boxes, and the "sticker" stamp is frequently lost or removed in transit. In either case a charge of one-half cent each is made for the use of this stamp, payable to the state department of agriculture. The revenue derived from this sale is used for the employment of inspectors to enforce the law in the principal apple producing sections of the state. The Watsonville district produces by far the largest revenue. During 1919 it was somewhat in excess of \$15,000. Five or six inspectors are employed in this district. The Sebastopol district produces a revenue of approximately \$4,000, and in that district one inspector is employed. Southern California has so far produced a very small revenue (about \$700 during 1919), but we have considered it advisable to maintain one inspector there, as some day the apple producing sections south of Tehachapi will in all probability produce a greater amount of packed apples than the northern part of the state. Packers

are urged for their own protection to employ the use of the state stamp on every packed container. The department of agriculture is willing to furnish thoroughly qualified inspectors at any time the revenue is sufficient to permit the employment of such official.

This question has been frequently propounded by packers: "Does the state apple stamp protect us by providing immunity in other sections where our apples may be received and inspected?" Decidedly not. Any horticultural official at any point in California has the right, and it is his duty, to inspect any apples shipped into his district. However, the placing of the state apple stamp on a box means that the shipper or packer has complied with the standard apple act to all intents and purposes and considers that the protection which he obtains by a strict enforcement of this law will be of sufficient value to him, indirectly, to justify his assisting in the enforcement by paying into the state treasury one-half cent for each box of apples that he places on the market. It has been found that not enough money was obtained from the sale of these apple stamps to provide a sufficiently strict enforcement of the law. As in the very nature of things the future success of the apple industry depends on the quality of the pack, the apple interests of Watsonville have agreed that during the ensuing season, instead of paying one-half cent a box for every box packed under the state stamp, they will pay one cent. This will enable us to double our force of inspectors at Watsonville and hence make doubly efficient the inspection service. We hope that the Sebastopol district will agree to do likewise.

The apple districts in Southern California are peculiarly situated, two of the main ones, Oak Glenn and Yucaipa, not even being on a railroad line. This frequently necessitates the shipping of apples from these districts loose in lugs to central market, where frequently they are packed. In many instances the apples are graded before being shipped to central market and it would seem desirable that such gradings be inspected prior to shipment.

In conclusion, it must be remembered that California, with its ever increasing apple acreage, must compete with the Northwestern states on Eastern markets. It is only by the establishment and enforcement of rigorous standards that we can hope to keep our California apples at par with those of the Northwest and to give them the advantage they rightfully deserve, due to superior quality, flavor and appearance.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double

sacks, are the fluffiest and PUREST sulphur that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men \$4 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 110 pounds per acre DIAMOND "S" BRAND POWDERED SULPHUR, 100% pure. This has increased various crops up to 500%. Send for Circulars No. 6 and 7.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur Mixtures, etc.

And "Anchor" Brand Standard LIME-SULPHUR SOLUTION 33 degree BE., etc., Fungicides and Insecticides.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO.
624 California Street, San Francisco, Cal.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET"; also booklet "NEW USES FOR SULPHUR." Price-list and Samples.

Ask us for prices for Carbon Bisulphide, the surest remedy for destroying ground squirrels.

VINE DAMAGE FROM CUTWORMS

The following damage in vineyards in the Calistoga area has been reported by County Horticultural Commissioner Butler of Napa County. R. L. Nougaret of the office of viticulture reports grape buds in Calistoga and other districts of Napa County suffering from probable cutworm damage. The vines do not start out until late and make practically no grapes but a little later send out a vigorous growth of suckers. Mr. Nougaret writes: "The main or principal bud which gives the shoot of the year and which is the fruit bearing bud has been destroyed by some cause or other and for that reason many small shoots start from that one center where the main bud existed but are really put forth by dormant buds. I would ascribe the trouble to cutworms although it may be due to frost at the time the buds were just on the point of developing and opening out, but my reason for giving preference to the cutworm injury is that I find among the buds sent me some which show the effect of having been eaten into by that insect. As late as this, it is difficult to recognize just what is the cause of the injury, but the growth now present has all the aspects of the secondary growth which follows cutworm attack.

"I have had but slight experience with cutworm injury on grapes in the northern districts and for that reason I am somewhat surprised at the lateness of development of the dormant buds. From my experience where the major portion of a 40 acre vineyard had been attacked in this manner and the second growth of shoots came out quite late. In the southern portion of the San Joaquin Valley where I have had more experience with cutworms the shoots generally come out earlier and more rapidly after the vines have been attacked, but that may be due to both climate and the variety of grapes.

"There is nothing to worry about in this case, that is, as far as the health of the vines is concerned; unfortunately there will be no crop, or very little, on vines affected as those from which samples were taken. I would advise, however, that the vineyardist go over his vines and pinch off all the shoots but one where the shoots are growing from the same bud so as to have good pruning wood next year, or I fear the canes will be rather spindling if all of them are allowed to grow."

PLACER COUNTY PLUM GROWERS WANT SPECIALIST

At a meeting held in Newcastle on June 24, about 40 growers and others discussed problems of plum production and went on record as advocating the securing of a branch deciduous experiment station. It was also decided to endeavor to have a specialist detailed there this season and next spring to observe conditions and study the situation.

The meeting was called by the county horticultural committee, Messrs. Bisbee, Butler and Bergtholdt. Mr. Bergtholdt stated that some varieties of plums were declining in production and that there were many factors to be considered. Those present gave various reasons to account for the decline, among them being the following: four dry falls and winters, poor irrigation methods, lack of fall spraying to control brown rot and peach blight, plowpan, unfavorable weather conditions, and lack of cross pollination.

J. E. Bergtholdt, H. E. Butler and Dr. O. L. Barton were appointed a committee to conduct a campaign to secure a specialist to study the situation and also to secure a branch deciduous experiment station. Petitions will be prepared and circulated among growers.

In response to the appeal of plum growers Prof. A. H. Hendricksen of the University of California was detailed to make a preliminary survey of the situation. Arrangements are to be made, if possible, for extensive experiments this fall.

SWEETS FOR US

Cuban official statistics show exportations of 163,716,219 gallons of refined molasses in 1918, of which amount the United States took 161,023,117 gallons. During the same year 57,137 gallons of crude molasses were exported to the United States.

EVAPORATION OF GRAPES

Explanation of the principles of grape drying by evaporators is given in a recent University of California publication based on the work of the university farm evaporator during the past year. "Drying has proved to be one of the most feasible methods of converting the wine grapes of California into a non-perishable salable product," it is stated. "In the hot interior valleys, where the grapes ripen early, the fruit may be dried successfully on field trays in the vineyard. However, at least 50 per cent of the wine grapes are grown in regions where the grapes ripen so late that sun drying can not be safely undertaken because of the danger of loss through early fall rains." Written by W. V. Cruess, A. W. Christie and F. C. H. Flossfeder, the circular is available by writing for Bulletin No. 322, College of Agriculture, University of California, Berkeley.

CIRCULAR ON FRUIT JUICES

"Unfermented Fruit Juices" is the title of a recent circular issued by the college of agriculture of the University of California in which recipes are given for the making of grape juice, pomegranate juice, loganberry juice,

and apple juice, "queen of fruit juices." The article was prepared by W. V. Cruess.

In view of the high price of sugar the manufacture of fruit juices offers a means of preserving fruits which may otherwise go to waste for lack of sweetening, it is stated. Berry growers situated at too great a distance from the fresh markets may solve this problem by the manufacture of juices. This Circular 220 may be had free upon application to the College of Agriculture at Berkeley.

NEW DIVISION OF THE STATE DEPARTMENT OF AGRICULTURE

The arrival of Professor Geo. P. Gray, in charge of the office of agricultural chemistry of the California department of agriculture, with his aides, Professors Geo. E. Colby and A. C. Wilber, is announced by Director Hecke today. The office of agricultural chemistry was provided for by act of the last legislature creating the department of agriculture, and the actual removal of the laboratories from Berkeley began on July 1, 1920. This branch of the department is charged with the important work of investigation of fertilizers, and analysis of insecticides and spray material.

RHUBARB---Wagner's Giant Plant Now

July is one of the best months to plant. Growers who planted last July and August have already harvested over 15 tons per acre netting \$1,000 eleven months from planting. For further information write J. B. WAGNER, Rhubarb Specialist, 1550 East Villa St., Pasadena, California.

TWIN CITY

12-20 Kerosene Tractor with 16-valve engine

Surplus Power Speeds Work and Saves Money

TWIN CITY 12-20 with its great surplus power insures you good work in any going—a quick finish—a bigger saving both in labor and money. In its steady pull, with double discs and packer, it shows the same Twin City dependability as in plowing, harvesting or belt work.

This is due to its Twin City 16-valve (valve-in-head) engine which turns all of the fuel into power—clean power—with every charge. It is due to the Twin City's combination of unusual strength with light weight in heat-treated alloy steels.

In a word, it is due to the science and practical knowledge which one of the largest institutions in tractor-building has put into the Twin City. It is the product of ten years' development by a \$7,000,000 organization with branch warehouses, distributors and dealers throughout the United States and Canada to give you immediate service when you need it. Built to do the work—not to meet a price.

See the Twin City dealer nearest you. Or write us for details.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Castor Beans

Where can I sell castor beans?—Subscriber, Escondido.

The Globe Milling Company, Los Angeles, is pressing some oil and it is possible can handle the beans.

Farm Title Accepted by Land Bank

We recently stated that the federal land bank accepted the Torrens title, but in order to have authentic information we wrote the bank at Berkeley asking as to the attitude regarding these titles. We are glad to report that it does accept them. In answering our questions to the bank Lysander Cassidy, registrar and attorney, says:

"Generally speaking, our practice as to so-called Torrens title certificates has been as follows: Subject to requirements hereinafter made such certificates are accepted after they are one year old. Evidence required that

there are no liens in the federal courts and no bankruptcy or other proceedings pending in the federal courts affecting the property. In case the property is described by reference to a recorded plat, we require a plat to be furnished, showing the dimensions, shape and acreage of the property. We reserve the right to require an abstract of the Torrens title proceedings in any case where inquiry reveals that the purpose of the suit was to remove some substantial defect in the record title of the applicant for the loan. In case the certificate shows a subsequent deed executed by an administrator, executor, receiver, sheriff or some other person in some official capacity under and by virtue of court proceedings, then we require abstract of such proceedings so that we can determine that such proceedings are regular. The requirement as to a plat is made because the so-called Torrens title law makes no provision for a plat, and it is impossible to determine from the certificate, in case

the property is described by reference to a plat, the shape, dimensions or acreage covered by the description in the certificate."

Cheap Paint

In your issue of July 3 you ask for recipe for a cheap paint. For a cheap roof paint eight pounds of metallic lead mixed well with one gallon linseed oil, to which may be added about three gallons of creosote. This paint gives an excellent roof preservative. Keep well stirred while applying.—Cash Nursery, Sebastopol.

The quality of this paint cannot be gainsaid. Linseed oil and creosote make about the best shingle stain or paint on earth, but unfortunately with linseed oil more than six times as expensive as it was five years ago and with creosote especially high the above provides rather expensive paint.

Clearing Pipes from Sink

Do you know of any acid that will dissolve soft soap in sink pipes which have been filled with grease? Lye has been put in, which seems to have formed a soft soap that hot water will not cut.—Subscriber, Sebastopol.

We have never failed in clearing the pipes with lye. We usually empty a

quarter or perhaps half a pound of the dry crystals on the strainer over the outlet. This is carefully washed down, or at least half of it, into the gooseneck underneath the sink. If boiling water is used for this purpose greatest care must be used or an explosion may occur. We have usually found cold water or lukewarm water sufficient, and there is no danger in pouring this over the small pile of lye. After lye has remained a few hours or over night the screws of the strainer may be taken out and the garden hose used (where one has water under pressure) to force the water through the gooseneck and the pipes. This generally washes not only the remaining lye out of the sink and the pipe but also dirt, grease, lye and everything down the line. This is very effective where the end of the small coupling on the hose is forced down into the end of the pipe and full pressure is turned into the waste pipe of the sink. Where there is no water under pressure boiling water in quantities should accomplish the removal of the grease. In case it does not, then we would resort to gasoline in sufficient quantity to drive all the water out of the gooseneck and follow this with the hot water, that is, after it has remained in the pipes for a few hours. There also are rubber plungers with cup like form which may be used to force water down the line.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Division of Estate

A father dies, having several children, of whom one died a number of years before, leaving one child. The father leaves a will distributing his property between the surviving children but does not mention the child of the one who is dead. Will the court give to this child its parent's share of the estate, even though no claim is made for it, and divide the balance according to the will?—Subscriber, Terra Bella.

The code provision in this respect is that when any testator omits to provide in his will for any of his children or for the issue of any deceased child, unless it appears that such omission was intentional, such child or the issue of such child has the same share in the estate of the testator as if he had died intestate. On information being given to the court in petition for distribution of the existence of such child, it would undoubtedly be the duty of the court to follow the provisions of this section of the code, although, of course, that does not affect the matter that the child whose name was omitted from the will might give the property to his uncles and aunts.

Paying Board

A grandfather has been living with his daughter for three years. Can he be made to pay for his board? He has helped a little on the place, but very little.—Subscriber.

In order to authorize compensation either way in such cases, the courts have almost uniformly held that the circumstances must be such as to warrant the inference that it was the expectation of both parties that compensation should be made, and in this respect it has been held that it is the expectations of the parties existing while the relationship continues, that is to control, and that any circumstances occurring afterwards can

HYATT

ROLLER BEARINGS

In these Plows

Avery Co.

After long field tests, manufacturers of these plows have adopted Hyatt Roller Bearings for use in coulters.

Experience has shown that plows, as well as other implements, must be built as well as the tractor—must be able to work hour after hour and day after day, giving constantly dependable service.

Hyatt Bearings keep plow coulters running straight and true and need oil but once a season. They add to the life of a plow and are designed, built and installed for permanent service, never requiring adjustment.

This is typical of the advantages that Hyatt Bearings provide in other farm machinery, such as tractors, threshers, binders, wind mills, etc.

not convert that into an implied contract which was not so before. Where there is a blood relationship between the parties it may be well inferred, in absence of a direct understanding to the contrary, that pecuniary compensation was not expected by the one performing the services. This rule would also apply to any contract or agreement for the payment of board or lodging.

Torrens Title

Is the Torrens title law in operation in this state? If so, how can one get in touch with it?—Subscriber, Chula Vista.

The Torrens title law has been in operation since 1915 and specially availed of in the southern portion of the state. Many hundreds of parcels of city property have been brought under its operation. For any individual to bring his property under the operation of the act entails a rather high initial cost, but this objection has been largely obviated by combining a number of parcels of property belonging to different owners in one general proceeding so that the initial cost is greatly reduced as against each individual parcel. After the court proceeding these parcels are not in any way bound together, but this course is taken merely for the purpose of lowering the initial cost. There are throughout the southern portion of the state, to the knowledge of the writer, several concerns who handle Torrens title proceedings, and it is only necessary for any person desiring to bring his property under this act to get in touch with some one of these concerns. The first proceeding is to file a verified petition in the superior court of the county wherein the land is situated, stating the name and address of the applicant and facts concerning marriage relation, description of the land and improvements, value of the last county assessment, and the length of time for which the applicant and his immediate predecessors in interest have been in actual and exclusive possession of property. At the time of filing the petition an abstract of the title must be also presented, but in this respect a certificate issued by any title insurance company is sufficient to the date thereof. It must also be shown what incumbrances there are on the property and the names of parties owning the adjoining property. Upon the filing of the application the court issues an order that all persons appear in court on a date stated in the order and show cause why petition should not be granted and registration directed. This notice must be published for 30 days in the county and served upon any incumbrancer and bordering owner or other person mentioned in the petition. If no one appears, then the court hears the petition, and if found to be true, directs the registration of the land. If anyone does appear and object to any of the statements of the petition, then the court hears the objection and gives its judgment after hearing the evidence. Upon registration with the county registrar a certificate is made up which describes the land, its owner, and the condition of the title. This certificate thereafter takes the place of the title deeds and certificate of title under the old form of procedure. The applicant pays to the registrar an amount equivalent to one-tenth of one per cent of the assessed value of the land with improvements; this amount goes into the insurance fund which is employed to insure all titles under the act. After property is brought under the act, subsequent

transfer or incumbrances are all made exclusively by the registrar of titles and not by the recorder. No further insurance fees are entailed and the cost of changing title or evidencing an encumbrance is approximately one dollar, which is about the least charge made by the recorder alone for recording documents. The act is a highly beneficial one in many respects as the title of the property is quieted by a judicial decree binding against the world, and is insured by the state of California. The only great objection has been the initial cost of bringing property under the act, together with the length of time required and the inexperience of parties dealing with land under this proceeding, but as time goes on many persons are of the firm belief that it will supplant the cumbersome and expensive system now in vogue in respect to the recording of conveyances and the guaranteeing of titles by private corporations.

RAISINS TO THROW AWAY

(Continued from Page 67.)

use the pickers when they are in his district and available. Second, the fear of loss from early rains. Third, lack of information regarding the

method of testing for sugar. The first two may be considered very real and legitimate reasons; the third is almost without excuse.

When the grower learns more about the operation of testing for sugar and realizes more fully how very simple the process is, and practices it, he is in a position to know when he can best use the picking crew and can often trade his picking turn with some neighbor who may have fruit which has ripened a little earlier due to soil or other cultural conditions. If the vineyard is a large one the grower can by frequent tests determine which block should be harvested first. Suppose by so doing the grower is only enabled to hold off a sufficient length of time to gain one degree of sugar, surely a saving of \$2.50 per ton of fresh fruit, or better, is worth a little effort.

As for the possibility of rain damage, it would seem from the above facts that the progressive grower could well afford to pay interest on the investment in a good emergency dryer out of the savings he would realize from extra raisin tonnage, and possibly he could pay for most of the extra labor in the same manner.

In spite of these facts there are many growers who will this season actually lose more money by picking before the grapes are ripe than they would have received for their entire crop when there was a so-called "over-production of raisins" prior to the organization of the raisin association.

The raisin association is interested

in the question of a higher average sugar content not only because it means greater returns per acre to the grower but because such grapes invariably make raisins of much better quality. The consumer receives a better product and in time there is a response expressed by increased demand for raisins which benefits everyone.

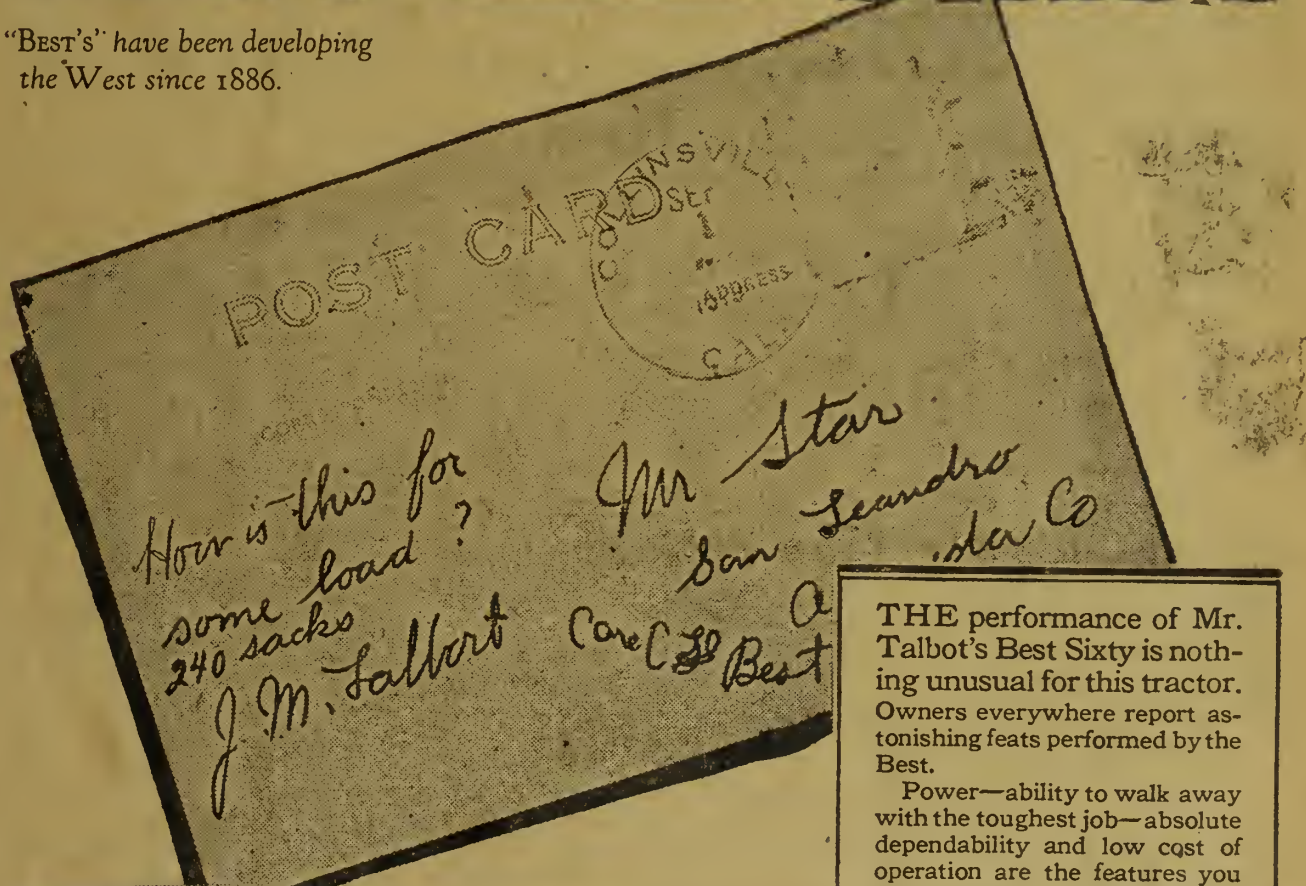

Of course, the fruit must be well grown to realize the highest possible quality, but there is probably no other single factor which contributes more toward the making of a good product than does a reasonably high sugar content.

For the purpose of maintaining and improving the standard of quality for Sun Maid raisins the association is this year launching a sugar testing campaign and is placing saccharometers in most of its plants. The field men will also carry testing equipment so that no grower need be in ignorance of the condition of his crop at picking time, and he can then use his best judgment regarding the local labor situation and the possibility of rain damage to his curing crop.

In recent years a great deal of money has been spent for improved machinery and equipment to handle the raisin crop after it is delivered by the grower. These improved methods of handling and national advertising campaigns are largely responsible for the increased popularity of California raisins, but no machinery or advertising will do the amount and kind of good that "Old Sol" will do for the raisin if given a chance.

BEST TRACKLAYER SIXTY

"Best's" have been developing the West since 1886.

THE performance of Mr. Talbot's Best Sixty is nothing unusual for this tractor. Owners everywhere report astonishing feats performed by the Best.

Power—ability to walk away with the toughest job—absolute dependability and low cost of operation are the features you should expect to find in your tractor. And the Best supplies these in full measure.

Mechanical design, quality of materials and painstaking, skillful workmanship are responsible for Best performance. Write for catalog describing these and other features of the Best Tracklayer Sixty Tractor.

Will the Dairy Cow Come Back?

By M. E. Bemis

FEW years ago the Salt River Valley of Arizona was noted as one of the leading dairy centers of the country. Probably there was no place in the United States that made the percentage of increase in number of dairy cows that was made here. There was also a marked interest in registered stock. From about 12,000 head in 1910 the number increased to 60,000 or more in 1917. Good markets, extremely favorable climate, alfalfa for feed, make a combination of favorable circumstances which was the incentive to rapid increase in numbers of the dairy cattle up to 1917.

The cotton acreage has been increasing rapidly and the number of cows has been declining. Those of us who have watched the exodus of dairy cows have felt from time to time that the low point had been reached and that the upward climb would again begin. Something like a year ago Cultivator readers may remember that in an article I stated my belief that the low tide in the dairy industry had already passed. I guessed wrong. If there is any consolation in having company when one makes a bad guess, it might help some to think that there were many others who made the same prognostication at that time. The one thing we did not figure on, and the one thing that was unexpected, was the greatly increased price of cotton, particularly long staple cotton. At the beginning of the cotton picking season in 1919 cotton opened up for around 70 cents; some sold for less. Then at about the peak of the season prices began to rise and, contrary to any precedent in the history of our cotton market, there was a steady rise and a demand which moved the cotton almost as fast as ginned. Finally the price reached \$1.25 a pound and in a few instances sold for even more than that. The consequence was that men who had planned to reduce their cotton acreage decided to increase it. Dairymen who had conservatively figured that they would cull their dairy herds, retaining the best, decided to dispose of them altogether. Others, allured by flattering offers, either the high price for the land or a high rental price, disposed of their stock, frequently at a sacrifice, believing that the increased profit on the land was more advantageous than the prospects of reasonably fair prices for the dairy products.

This condition obtained throughout the entire valley, and day by day carloads of dairy cows were shipped out; others went to the butcher. At the present time it is probable that the number of dairy cattle is less than it was in 1910. Whether the end has been reached or not I don't know. One favorable thing about it is that in the passing of the dairy cows from the Salt River Valley there has been a stocking of the farms in other parts of the state; while a great many of these cows have been shipped out of the state, a considerable number have been retained.

Up in the undeveloped country at the foot of the White Mountains, where the new railroad from Holbrook has opened up a new lumber camp, there is a considerable number of new settlers who have located on lands which they have been able to develop, and in consequence of the markets open to them by the building of this railroad, they have opportunities to do exceptionally well. It seems to us rather strange, but nevertheless true, that these farmers are producing cream which is being shipped on this branch line to Holbrook and then on the main line to Phoenix creameries, a distance of approximately 500 miles. In the Tucson district there has also been a marked increase in the number of dairy cows. In the Casa Grande country one dairy alone has 500 head of cows. Cream from this dairy will be shipped largely to Phoenix, so that from a broad state wide viewpoint the situation is not as serious as it might seem.

In the Salt River Valley land prices have advanced to a very considerable extent. I recently asked the manager of the Armour interests, who have two condensed milk plants here (both of which have been closed on account of the shortage of help), if he consid-

ered that there was any prospect of a revival of the dairy interests. He answered: "Yes, decidedly; we will keep our plants intact with the exception of a small amount of machinery, trucks, etc., which have about served their usefulness. All modern machinery will be retained and we expect to operate again when the time is ripe. I look for a change in the sentiment regarding cotton raising and a return of a considerable acreage to alfalfa." I asked him if he thought it would be possible to operate a dairy successfully on land priced as high as Salt River Valley land at the present time. He replied that he thought it was not only possible but practicable, but it meant the use of the best cows. I asked then what he considered the standard requirements of cows that would pay on land worth \$400 and \$500 an acre, and suggested 400 pound cows. He replied that cows producing 350 pounds of butter fat should pay provided good management was used.

Here and there throughout the valley I find many who are holding on to their dairy cows, like Derby Rucker, one of our farmers who has made himself a home and has stayed with the various vicissitudes of the valley fortunes for the last ten or 15 years. He says: "I am going to stick to the cows and chickens awhile longer, anyway. I have just finished harvesting 27 tons of oat hay from a five acre field, and as long as I can do this I am satisfied to keep the dairy and the chickens without going in heavy for cotton."

Henry Renaud (who, by the way, is our pioneer in the breeding of registered Holstein cows in this valley), says:

"There are only about one-tenth as many dairy cattle in the valley today as there were a few years ago, but I believe that the time is coming when there will be as many in the valley as there were at the time of the peak of our dairy industry."

Mr. Renaud is holding his cows, selling the surplus only as has been his custom for several years.

The George Brothers, who have operated a retail dairy out on north Central Avenue north of Phoenix for the past five or six years, state that they are going to stay with the dairy industry indefinitely. That means they have not set the time when they will dispose of their cows to raise cotton. They have a small acreage of cotton but are still milking a large number of cows and are making no plans for changes in the near future.

I learned of many cotton farmers who expect to put a considerable acreage back into alfalfa this fall. This is logical, as some of the land has been in cotton for several years and for best results should be rotated.

No one can foretell what the price of cotton will be this fall. Many expect to see it held steady at around \$1. Even if it does average \$1 a pound (and there is good reason to believe that it will), it seems probable that the area of land in cotton has now reached the height and there will be a gradual change so that only land which is best adapted to cotton will be put in cotton, and that which has begun to show a marked deterioration in yield will be returned to alfalfa in a rotation which will again fit it for cotton. If this proves true, then we may expect to see a gradual increase in the number of dairy cows, but with this increase will come better methods than were in vogue before. There will be few dairies established without the silo as an adjunct. There will be fewer cows producing less than 300 pounds of butter fat a year. There will be more cow testing associations and a higher plane of dairy management.

A DECREASE IN HOG POPULATION

There are in the United States at the present time approximately 70,000,000 hogs, and according to a government report this country will experience a shortage of hogs this year. With a ten per cent shortage of brood sows, as we have at present, it will mean a shortage of seven to eight million hogs.

Facts in BLACK & WHITE

Purebred Holstein Cows Return \$1.54 for One Dollar of Feed

Even though you may regard your farm as a diversion or your hobby, you would doubtless prefer to see it self-supporting, and perhaps take still greater pride in it for that very reason. Here are two or three facts! Holsteins are the largest, most vigorous, most even-tempered, the easiest-cared-for breed, and the greatest yielders of milk in the world. Their milk is the most evenly balanced in fat, sugar and proteins, and for that reason easily digested. It is everywhere recognized by the medical profession as absolutely the best for infant and invalid feeding as well as for general use. A herd of Holsteins will give you on the average \$1.54 for every dollar's worth of food they eat. Send for our free literature and look it over. Perhaps you will be interested in buying Holsteins.

The J. C. Craig herd of Durocs at Owensmouth is now to be accounted one of the leading herds of the state from the standpoint of individuality and blood lines represented. Within the past 12 months the foundation has been laid anew through expert selection from the best herds of the Middle West. Regardless of cost, Mr. Craig has secured just what he wanted. The big junior yearling boar Jack's Cherry Vic is pronounced a real representative of the big type hog. He is well proportioned and symmetrical, and he conforms strictly to the type of Duroc that has taken the Middle West by storm the past two or three years. The Craig herd is now to be based on high backs and strong underpinning, with all the stretch, vitality and good feeding quality that the breed commands. One of the leading sows is Wanda, a daughter of Great Wonder I Am. She has raised a remarkable litter of pigs, now eight months old, got by Pathfinder's Likeness, a son of old Pathfinder. Three boars and three gilts of this litter are still to be seen at the ranch, two young boars of the litter of eight raised having been sold. The dam is now in the East to be rebred to same sire. An outstanding boar of this litter, reserved for the show herd, is Pathfinder's Likeness Jr. A close second is his littermate, Pathfinder's Likeness Wonder. Choice Lady Orion is another Eastern sow raising litter of seven March pigs by Pathfinder's Repeater. Ruby Pathfinder is a fine yearling sow with nine pigs by Sensation Climax. Ranch Lady 2d, by Grand Model 8th, has fine litter by Winsor's Giant Orion. One of these young boars is sold to the Sonora Land Development Company, Sonora, Mexico. Two of the big yearling sows, one of them a daughter of Giant Wonder I Am, are now in Iowa to be mated to the great boar Pathfinder Supreme, the world's champion futurity boar of 1919.

Grant A. Brown, owner of Eastmont Farm Jerseys, is indefatigable in the interest of his favorite breed. Today Brown is getting within close range view of his hobby for an exclusive herd of Jerseys bred and reared at Eastmont Farm. At head of the herd of 47 females stands the well known line bred Financial King bull, Lady's Shylock's Financier 148173. There are 14 of his heifers reserved for the home herd and 11 heifers sired by his full brother. One of them, a 16 months old show heifer, is out of Shy Lady Viola, whose record is 501 pounds fat. She was grand champion at both Los Angeles and Riverside last year. Gertie of Willowood made record of 568.17 as senior four year old, showing 6.34 per cent fat. She has five months old bull calf by herd bull that is in a class by himself. Her yearling heifer won in every class last year. The Eastmont herd will be in the lineup at the shows again this year.

The Italian Vineyards, Guasti, have added the outstanding sow, Rival's Wondress 48th, to their large herd of Berkshires. She was secured in the sale of Piping Brook Farm, Greenwich, Connecticut, at the price of \$575. In breeding she is a combination of the breed's greatest blood lines, being by Lord Premier's Successor Jr., a son of the world's famous Lord Premier's Successor, and out of a daughter of Rival's Champion, whose blood is found in some of the coast's leading herds. She is bred for early fall farrow to Farview Ruler, grand champion at six state fairs, Eastern Berk-

HOT WEATHER

the season when a

DE LAVAL SEPARATOR

saves most over
any other separator
or skimming system

IT'S A GREAT MISTAKE for any dairy farmer without a separator or using an inferior machine to put off the purchase of a New De Laval Cream Separator in the summer months especially with butter-fat at the present unusually high price.

Great as are the advantages of the New De Laval over all other separators, as well as over any gravity setting system, at every season of the year, they are even greater during the mid-summer season than at any other time.

This is because hot weather conditions occasion greatest butter-fat losses with gravity setting and render it most difficult to maintain quality of product with any gravity system or unsanitary separator, while, moreover, the quantity of milk is usually greatest, and any loss in either quantity or quality of product means more.

Then there is the great saving in time and labor with the simple, easy running, easily cleaned, large capacity New De Laval machines over all other methods or separators, which naturally counts for more at this time of the year.

Hence the great mistake of putting off the purchase of a New De Laval Cream Separator in summer, whether you already have a poor machine or none at all, and every dairy farmer should keep in mind not only that a De Laval will pay for itself in a few months but may, if desired, be bought on such liberal terms as to actually save its own cost while being paid for.

Every claim thus made is subject to easy demonstration, and every De Laval local agent is glad of the opportunity to prove these claims to you, in your own dairy, without cost or obligation on your part.

Why not see the nearest De Laval agent at once?
If you do not know him, write to the nearest
office for catalog or any desired information.

Registered Shropshires

Five Yearling Bucks, 12 Ewe and Buck Lambs For Sale
C. J. L. STONEBRAKER, R-2, Chico, Cal.

When Writing Advertisers Mention California Cultivator

shire Congress and the National Swine Show, 1919. In the same sale three sows carrying the blood of Grand Leader 2nd, the boar that won the grand championship for A. B. Humphrey at the P. P. I. E., averaged \$350. The sale average for 37 bred sows and gilts was \$234.

Howard Vaughn, who has been breeding Shorthorns in Iowa for a number of years, has recently arrived in California with the intention of making his home in this state. At the present time Vaughn is associated with George E. Dierssen, Shorthorn breeder, near Sacramento. Vaughn expects to locate somewhere in the Sacramento Valley and will bring out his herd of Shorthorns. Vaughn is a graduate of the Iowa state agricultural college and is well known as a breeder and judge throughout the Middle West.

It is understood that the University of California has secured the services of E. H. Hughes as assistant professor of animal husbandry. Hughes is a graduate of the Wisconsin agricultural college and for the last seven years has been connected with the college of agriculture, University of Missouri. He comes to this state with a splendid reputation as a sound and practical livestock man.

Berkshire breeders who have heard so much recently about the boar, Achiever, owned by J. Francis O'Connor, Castleview Ranch, Santa Rosa, are promised another surprise when O'Connor brings out his senior yearling boar, Enhancer. This fellow is a son of Big Leader and is one of the largest and stretchiest boars that the breed has produced in this state.

There is every reason to believe that the coming state fair will stage one of the best barrow shows yet to be held in this state. The prize list is liberal and the breeders are fitting some very high class representatives of the different breeds. Barrow shows are certain to become popular in California.

Roselawn Stock Farm, Woodland, is preparing a number of calves for the Shorthorn classes this fall and in the lot are several that promise to be troublesome. Several of the calves were secured in the East last winter, two of the most attractive being by the noted bull, Village Beau, and out of extremely well bred dams. Since the recent additions to the Roselawn herd that collection of cattle takes high rank among the top herds of the West.

The admirers of milking Shorthorns should see the young herd bull Count Tickford, owned by Thos. Harrison, Santa Rosa, at the leading fairs this fall. Mr. Harrison has refused more money for this good yearling than any dual purpose bull ever sold on the Coast and is not even interested in selling him as he would be hard to replace.

Among the good junior yearling Poland China boars to be shown at the state fair this year will be Headlight, owned by William Marshall & Son, Sebastopol. This boar was sired by Repeater, first prize junior yearling boar at the National Swine Show last year, and is out of a Disturber sow. Marshall & Son have refused several good offers for Headlight and expect to feature him in a bred sow sale next winter.

Mrs. Eliza Shepard of the Jack London Ranch, Glen Ellen, recently disposed of the Shire horses on the ranch to Thos. Stanton, Wheaton, Illinois, and received on the deal a load of straight Scotch Shorthorn cows that are now en route to California. These cows are of the best families and will greatly strengthen the London herd.

Geo. A. Stingle, El Monte, is able to show his customers and visitors in general a lot of ten young Berkshire boars of his early litters that are a credit to the breed. From one of these litters Mr. Stingle has just now shipped a young boar to a Kansas buyer. They are the get of such sires as Sensational Masterpiece 8th, Ideal Royal Lee and Mills Ames Rival. A litter of nine

are out of the big type sow Natomas Robin Hood and tracing close to the renowned Royal Champion's Best. A Star Leader dam has nine by the Ames Rival sire. Leader's Violet 4th, a granddaughter of Grand Leader, has litter of ten. A fine March litter is that of Poly Queen, got by Sensational Masterpiece 8th. At head of the herd now is the fine boar Prince Laurel 5th, his dam being a daughter of great Laurel's Champion. Fine alfalfa runs for the breed sows and the growing pigs are one of the features of the ranch. Visitors are welcome at all times.

K. S. P. J. Pet Segis, the remarkable junior two year old daughter of King Segis Pontiac Jannek, on test in the James J. Jeffries herd of registered Holsteins at Burbank, has to her credit 21.47 pounds butter from 632.2 pounds milk in seven days, best day's milk 99.6 pounds. As stated in these columns last week, this heifer will be continued on yearly test.

Prospects are fine for a big general attendance at the Conejo Ranch sales, July 29 and 30, Newbury Park. The California livestock breeding public is interested primarily in the rearing of better hogs and more of them, without reference to the color of the hair, and all the finer points that characterize any particular breed; and then, too, there are those who look special-

ARIZONA COTTON LAND

We offer for sale a few select tracts of Arizona Long Staple Cotton land, 160 to 640 acres, at \$40 to \$75 an acre. Some of the finest land to be found anywhere in all Arizona, close to railroad, absolutely free from alkali, hard pan or adobe; no better soil ever lay out of doors. Lies fine for irrigation and an abundant supply of water can easily be developed at depths of 35 to 70 feet on the different tracts. Will produce wonderful crops of cotton, alfalfa, fruits and vegetables. One good crop of cotton or one season's alfalfa crop WILL MORE THAN PAY THE ENTIRE COST OF THE LAND AND WATER PLANT. This land is easily worth two to three times the price asked, which is made for quick sale. We are ready at any time to show any of this land to bona fide prospective purchasers. Call or write at once if you wish to get some of this land being offered at bargain sale. It will not last long.

ly to the improvement of their own favorite breed. At the big two days sale at Conejo Ranch there is room and opportunity for all. It would be a capital idea to be a "mixer" on this occasion. There will be sold from 80 to 100 head of breeding stock, everything registered and representative of the best in both Durocs and Hampshires. The records amply demonstrate this fact. A cordial invitation is extended to the public to come and see the big hog show.

At a meeting held at St. Louis, Missouri, June 29, participated in by each of the three Poland China record associations, several breed papers and a large number of breeders, a permanent organization, the Poland China Breed Promotion Association, was launched. The new association has for its object the general promotion of the breed, and each of the record associations has agreed to double the recording fees and to use the added receipts in promotion work. It is proposed that the new fees go in effect October 1.

J. H. Cook, formerly of Paradise, is now located near Chico and is making plans to increase the size of his herd. It is his ambition to have a sow herd second to none in the West.

The premium list for the Sonoma County fair will be ready for mailing within a few days, according to Secretary J. Francis O'Connor. Very liberal prizes are offered and every effort is being made to induce the breeders of pure bred stock to make an exhibit. The entertainment program is a very wide one and includes everything necessary to interest and entertain the public.

WINSOR RANCH OFFERINGS

The Winsor Ranch sale catalogue, now being distributed, gives ample proof of the leadership of this big institution as the pioneer breeding plant in the Western Duroc field. Among the 40 young bred sows catalogued are numerous stellar attractions. The fact is that Mr. Walker has just about gone the limit of genuine business enterprise to make this offering of bred sows come squarely up to highest anticipations. It is a truism today that the Winsor way is the right way. Walker has combed the older breeding districts for the right blood and the right type of Duroc, so that the alignment of young sows to be presented the public at Los Angeles on July 28 may be accepted as the correct thing in Durocs. Daughters of Great Orion Sensation, one of the most talked of sires in the Duroc world today, will feature this sale. There will be others by his famous litter mate, Orion Sensation. Others are by the great Pathfinder, and others yet by the noted Winsor Ranch boar Great Model, also daughters of the great Orion Fancy King. As a real leader in any public sale ring will be seen Winsor's first prize senior yearling sow at California state fair, 1919. She is a daughter of the noted Putman (Nebraska) boar Great Pathfinder, and she is not only a show sow but a producer par excellence, being the dam of the best young boar ever produced at Winsor Ranch. Her latest litter got by Great Sensation 3rd, the \$8,000 boar, is so highly satisfactory that she is to be sold carrying litter by same sire. Another last minute decision has been to list for this sale the 1916 grand champion Cherry Blossom, one of the tried producers of the ranch. She is known to be the dam or granddam of a long string of the best Durocs in Southern California. She is distinguished as being a half sister to old Pathfinder himself. Two of her litters have numbered 16 each. The great boars Winsor's Giant Orion and Great Sensation 3d are the sires in service for this splendid draft of bred sows. The catalogue is rife with timely information.

LUCKY MAN

"You say you served in France?" asked the restaurant proprietor, as he sampled the new cook's first soup.
"Yes, sir; officers' cook for two years and wounded twice."
"You're a lucky man. It's a wonder they didn't kill you."

The Young Breeder

If the novice or young breeder back in the corn belt has problems, surely the Californian has occasion to watch his step in the land of higher feed prices and less satisfactory marketing opportunities. Here is a bit of editorial advice from Wallace's Farmer of Des Moines, which may be of interest to young breeders of California:

During the past two years quite a number of successful young farmers in the corn belt have started pure bred herds of beef cattle. Some of these have been influenced by the high prices at which such cattle have been selling. They have seen comparatively new breeders make handsome profits and have felt that they might just as well get in on a good thing, and they have plunged rather heavily. Others have started pure bred herds in a more modest way because they have reached the conclusion that common grade cattle cannot be produced profitably on high priced corn belt land in competition with the cheaper lands of the West and Southwest, and that, therefore, the thing for them to do is to grow the best possible class of cattle and get out of this competition.

Some of these young breeders who have plunged will lose out, a smaller percentage of them will be able to make the turn before there is a severe drop in prices. Those who have started in a smaller way, with the idea of sticking to the business and gradually building up pure bred herds of their own, will mostly come out all right, and some of them will become noted as breeders in the years to come.

There are two or three things which should be kept in mind by the man who aspires to become a successful breeder of beef cattle. To begin with, he must have a real love for livestock. The true breeder finds his greatest reward in the satisfaction he gets out of working with his cattle. He has, indeed, the soul of an artist; and if he combines with it the skill of the scientist he will be successful.

He is dealing with the unseen forces of heredity. He has in his mind certain ideals of animal form which he strives to produce in the flesh by selection and mating and feeding. Year after year he works with these unseen forces and finds his reward as he sees his young stock more and more nearly approach his ideal. No man who has in mind the making of money alone can succeed permanently in the pure bred business.

The successful breeder must be as well a skillful feeder, and he must have a rich farm. A study of the history of any of the beef breeds shows very clearly that they originated on rich land. They had their beginnings on good feed and plenty of it, and with this as a basis they reached their present state of excellence through skillful mating. The finest specimens of any of the beef breeds, if taken to thin land and given the same kind of care and feed as that given to the native cattle produced on this thin land, will within a few generations become to all appearances about the same sort of cattle as the natives. The young breeder who fails to recognize this fundamental requirement in the production of the highest type of beef cattle is doomed to failure. There is no use trying to grow such cattle on land that produces poor grass. The farm must be rich and in a high state of cultivation.

Prices of pure bred cattle will not continue as high as they are now. In fact, they follow very closely prices of common cattle. The pure bred business has its ups and downs just as all other kinds of business. But the young farmer of the right sort, who does not plunge beyond his means, who has the instincts of the true breeder, who has the rich land, who will study the principles of breeding and feeding, can feel reasonably safe in starting a pure bred herd in a modest way. He may pay high prices for his seed stock, but if he buys wisely the increase will gradually grow into money for him.

Ten Thousand Hogs

N. B. Balis, in charge of the hog ranches on the big Fontana Land Company's holdings at Fontana, San Bernardino County, says: "We have very close to 10,000 hogs located here, at El Monte and in Santa Monica Canyon, the two latter plants being at garbage stations. On the home, or Fontana ranch, there are at present about 3,500 hogs, 600 of which are

brood sows. The numbers and kind are about the same at El Monte. No finishing is done at El Monte or at the Wade station where we now are, but at 90 to 100 pounds weight they are sent to what we call Station One, several miles up the ranch. At four weeks I turn the pigs into the alfalfa fields from the farrowing pens or 'batteries.' They are left there until 40 to 50 pounds in weight when they are vaccinated. They are then placed in dry lots until reaction is past, being fed on cut alfalfa and mash rations of a considerable variety. When fully recovered they are put back in the alfalfa runs until about 100 pounds in weight when they are sent to Camp One to finish.

In the mash feed we use a variety of material cooked in a giant steel vat. We use tankage, harley, milo, shorts, rice bran, ground cocoa shells, copra meal, beans and other crops grown on the ranch. At present we are getting milo in car lots from Oklahoma. Other feeds are purchased within the state. At this camp we have about 25 feeding floors, six by 18 feet, on runners. These are now mostly in the dry lots but will later be pulled into the alfalfa runs. We have here 160 acres of alfalfa divided into lots of two and a half acres each. Into each of these I turn 50 pigs as soon as weaned. They seem to make little inroad on the crop, for I have to cut it as often as though they were not there.

"Our litters for the past two years have averaged 6.6, and the heaviest litter was 18 pigs. We have seven batteries or lots of farrowing pens with a total of 152 and there are 152 sows in them at present. As you will notice, the house part of each pen is in the middle, so the mother and pigs may find shade at all times of day. Suspended doors close down for the winter season. The 'front yard' has a concrete floor upon which we do all feeding. The troughs are for water only and are automatically kept full. The 'back yard' is of natural soil. The front and back sides of the houses are kept hooked up and open during summer, to provide shade and venti-

lation, but in the rainy season all is closed tightly. The front of each pen is hinged at top so it swings inward for the placing of food on the feeding floor without having to lift it over the fence. Though we have pure bred Durocs, we sell none as such. All our hogs are for pork only."

RABIES

Through proper enforcement of a dog law, the population of dogdom can be greatly reduced. By this means all dogs on which no tax is paid can be destroyed. Compulsory muzzling is not always a wise plan, for in the first place it affords no protection when done in a perfunctory manner, and in the second place cruelty is often inflicted upon the beast when muzzling is resorted to in the proper manner.

All owners of dogs should be compelled to chain them, and all dogs running loose should be destroyed in communities where rabies exist, and this in view of the fact whether animals are suspected or not. All animals bitten by a rabid dog do not take the disease. However, it is a wise plan to assume that they will and to securely confine such animals so that the disease will not be transmitted to others.

Where animals are concerned we have no available means whereby infection can be prevented after a rabid bite has been received. When humans are bitten the Pasteur treatment is resorted to. This consists of a preventive inoculation which is a rather sure means of preventing the disease. While a rabid bite does not always transmit the infection, it is a wiser plan not to take chances but submit to the preventive treatment, since the disease in the active stage is an incurable one. In spite of the different conclusions made by various workers in this line, all agree that nowhere is cool judgment and prompt action more imperative than in our dealings with this disease.

HAMPSHIRE BREEDERS WILL MEET

E. C. Stone, secretary of the American Hampshire Swine Breeders Association, has sent out a call to all breeders of Hampshire hogs in the West to meet with California Hampshire swine breeders at their annual meeting to be held at the Conejo Ranch near Newbury Park on the Ventura state highway about 40 miles northwest of Los Angeles, on July 30, at 11 a. m. The National Association will be represented by Secretary Stone or one of his associates. Mr. Stone expects to arrive in California about July 15 and visit all the prominent Hampshire breeders in the West. President F. V. Gordon of the California Hampshire Swine Breeders Association expects a record attendance and states that this meeting will be of particular interest to all Hampshire breeders. Mr. Stone or his representative will explain in detail how the leading swine breeders over the country are all breeding up to the big type animals.

This is to be the annual get-together meeting of the Hampshire breeders. It is contemplated that the breeders will at this meeting talk over the feasibility of employing a competent field man to help boost the Hampshire breed.

WOOL CONSUMPTION LESS

Textile mills in the United States consumed 58,600,000 pounds of wool, grease wool basis, in May, 1920, as against 52,000,000 pounds the corresponding month last year, according to a report just released by the United States bureau of markets. The figures are low in comparison with the two preceding months—April with 66,900,000 pounds and March with 67,900,000 pounds—and are far under May, 1918, a war month, when 74,600,000 pounds were used.

The drop in consumption is attributed to transportation difficulties which confronted the mills, a slackening in demand for finished goods, and the tighter money situation obtaining the latter part of the month.

The Arizona Cattle Growers is issuing report of its last annual convention. Some of the southern counties report pastures drying and stock in serious condition.

Best Cheapest orchard berry and range lands. John F. Beckett, Arroyo Grande, California.

FARM LANDS FOR SALE

CAPAY RANCHO

On the banks of the Sacramento River. Water from never falling deep wells. 40 acres of fruit land, 2 second feet of water, \$150 an acre. 20 acres, adapted to prunes, apricots, peaches, \$150 per acre. 80 acres, 25 in alfalfa, 25 in two year old trees, balance graded and ready for crop, good house, large barn, water under pressure, lights and bath, farming tools and stock. Price for immediate sale \$300 per acre, good terms. Fred A. Clark, Resident Agent, Capay Rancho, R. F. D. No. 2, Orland, California.

For Sale — \$30,000 — In Visalia, one mile south from Court House, 30 acres of best soil all under cultivation and bearing, plenty of water, pumping plant, 5 inch pump and ditch water. 2 houses, 4 rooms each, and 2 barns. All farming implements can be bought with the place. 15 acres in Thompson Seedless, one and two year old vines; 6 acres in 6 year old french prunes; family orchard on each place consisting of pears, apples, apricots, peaches, walnuts and almonds. Two and one-half acres in alfalfa and balance in corn. Five thousand rooted Thompson Seedless, one thousand apricots, and two hundred peach trees, ready for planting next spring. This is all included in the price. This is certainly the best buy in Visalia. The place must be seen to appreciate its valuation. Address owner, Mrs. H. Gredsmakar, Visalia, California.

Lake View Citrus Farm 10 Acres \$2200, Easy Terms. Dandy little farm, pleasantly located, only 200 yards lake, fine fishing, boating, bathing, fruited 80 orange and grapefruit trees, remainder land high state cultivation, big crops, ideal for poultry; good 5-room house, barn, large new poultry houses; owner has larger farm, offers this beautiful little place low; \$2200, easy terms. Details this and another with 13 acres oranges, grapefruit, Page 52 Strout's Catalog Orange Groves and Other Semi-tropical Farms. Just out. Copy free. STROUT FARM AGENCY, 503 E. J. Wright-Callender Bldg., Los Angeles, California.

160 Acres Dairy Ranch well located six miles from county seat, 1/2 mile from highway. 50 acres alfalfa, 25 acres in corn and sorghum, balance pasture. 50 tons of hay. Fenced and cross fenced. One pumping plant. Good two story house, barn and other outbuildings. Family orchard and vineyard. 21 milk cows, 19 yearlings and two year old heifers, one exceptionally good bull, 7 pure bred Poland China brood sows, one pure bred Poland China boar, 23 head of 3 months old pure bred Poland China pigs, 10 head of work horses, one jack. All can be had for \$35,000, 1/4 cash. Balance to suit purchaser. W. H. Nyswonger, R. C. Box 123, Hanford, California.

Ranch for Sale—160 acres 1/2 mile south of Yermo Division Point, S. L. R. R., formerly called Otis, San Bernardino County. About 30 acres in fence and has been cropped. House and well for domestic use. One deep well for irrigating, complete with 6 inch pump, 20 H.P. engine. Water lift about 20 ft. Watermelons, tobacco, cotton, milo do well here. Now is the time to see it while things are growing. Will sell on easy terms and might exchange part for good property. Further particulars, address F. C. Brandt, Yermo, California.

240 Acres Near Parkfield, Monterey County, within 5 miles of oil rig now drilling; land on the same anticline rig is on. All fenced, no other improvements; 125 acres of good farming land. Price \$25 per acre, 1-3 cash, balance on easy terms. Can lease to oil Co. for a cash rental of \$1.00 per acre per year for 5 years by giving oil Co. option to buy at \$100.00 per acre. Many other stock and grain ranches to sell. Can get you oil leases from 10 acres up. C. P. Gould, 1032 Junipero Avenue, Long Beach, California.

120 Acres Irrigated alfalfa or fruit land, 52 acres cleared, 36 acres partly cleared, balance timber. Price \$5,000; 2-3 cash, terms on balance. Abstract title, plenty water. No trade considered. Located in Happy Valley, Shasta County, California. Write Box 133, Cottonwood, Shasta County, California.

FOR SALE AND EXCHANGE

10-20-40-60 and 80 acre ranches, rich level, plenty water; proven grape (Thompson seedless), fig and alfalfa land. Price right, easy terms.

FOR SALE

Some of the finest dairies in the state. Chas. McNeely, Alhambra, California.

ANTELOPE VALLEY

Buy cheap, good alfalfa and fruit land in the easy lift water district near improved dairy and hog ranches. \$50 to \$75 an acre, one-fifth cash. Send for circulars. The R. & L. Ranch, 611 Fay Bldg., Los Angeles.

Many Bargains in real estate for sale or exchange. Citrus and deciduous fruits, olive groves, and farm lands. I am a resident agent. Joe Sproule, Fallbrook, California.

For Sale—3 miles from Visalia, 10 or 20 acres of best soil, improved. House of 5 rooms. A snap for a party looking for an ideal place. Address owner, J. C. Aulman, Visalia, California.

Canadian Wheat Land — 160 acres improved, 1 1/4 miles from town of 4000. \$50 per acre. Terms. P. O. Box 98, Merced Falls, California.

If interested in securing farm lands or have same for sale write me. John G. Mee, St. Helena, California.

Poultry Queries

Conducted by J. A. Koethen

Intestinal Worms

Will you let me know what to do
for chickens with intestinal worms?
The chickens are just about broiler
size. They are droopy and sluggish
and their intestines seem full of thread
like worms.—Subscriber, Kennett.

Dr. Beach, pathologist at Davis, has
for several years recommended dry
tobacco dust, one pound of dust to 50
pounds of mash, well mixed into the
dry mash and kept before the birds
three or four weeks at a time, then
removed for three or four weeks, after
which it may again be placed before
them if necessary. It has been found
that tobacco dust, used in this way,
rids fowls of any age of round worms
and has no harmful consequences.
Tobacco kills the worms in a short
time, but if the birds are on infected
ground they are likely to be rein-
fected, hence the advisability of re-
peating the dose. It would be much
better to move the chickens to clean
ground as soon as they seem free from
infestation, but this is not always
possible.

Mixed Pictures

Thanks to my own carelessness,
probably, in not marking the photo-
graphs explicitly enough, a picture ap-
pears on page 1028 of the Cultivator
of June 26 which should have appeared
with another article two weeks earlier.
The caption is "Trapnesting the Lay-
ers," and the cut should have been
used with the article describing the
trapnesting methods of the Waldeck
Ranch at Burbank on page 970 in the
issue of June 12. I am the more sorry
for the blunder because Mr. Keppie
and Mr. Smallwood are both doing
really scientific and very successful
work, each in his own way, Mr. Keppie
with trapnests and Mr. Smallwood
without, and it is a pity to mix their
methods.

Caponizing Wanted

Do you know of any person in this
part of the country who caponizes
young fowls? If you know of such a
person we would take it as a favor
if you would send us such address.
We enjoy your department very much
and have utilized many a suggestion
given there. Your advice about de-
stroying vermin on poultry by using
fluoride of sodium was worth the price
of the Cultivator many times over.—
Subscriber, Fullerton.

The address of one such person has
been mailed this inquirer. It looks as
if the Cultivator might be a good place
for more poultry advertising. Requests
for names of breeders, etc., come to
us nearly every week. While the
Cultivator is a farm paper pure and
simple, you can't keep city folks from
reading it because it always delivers
the goods. Thanks for your words of
appreciation. We are honestly anxious
to be of service to all poultry people.

Blind Pullets

My three months old pullets start to
get blind in both eyes. There is a
grey skin over the eyes and water
runs out of it. Next morning they are
dead. What is the trouble, and can
you give me a remedy?—Subscriber,
Turlock.

This looks like a pretty good de-
scription of roup of the eyes, though
severe inflammation of the eyes is
sometimes caused at this season by
foxtails or barley beards getting into
the passage between the eyes and the
nostril. If the trouble begins with the
growth of the grey film over the eye,
without previous irritation or redness,

we must conclude, I think, that it is
a severe case of roup. Very likely if
you examine the mouth and throat you
will find patches of what is sometimes
called canker but is really diphther-
etic in character. The eyes should
be washed twice a day with an anti-
septic solution, either two per cent
boracic acid in a decoction of cham-
omile flowers, or a one-half per cent
solution of corrosive sublimate. Any
druggist will put up these preparations
for you. A simple solution of boracic
acid—a level teaspoon in a cup of
warm water—is sometimes effective.
Use an eye dropper or drop the solu-
tion into the eye with a bit of ab-
sorbent cotton. Follow the use of
either of these solutions during the
day with a slight application of pure
white vaseline at night. If there is a
discharge from the nostril it may be
syringed out with a two and one-half
per cent solution of creolin and glycer-
ine. Meantime you must look for the
cause of the disease, which, nine times
out of ten, is insanitary conditions
somewhere. It may be your pullets
are breathing foul air at night or are
roosting in a draft or are so crowded
on the roosts they never get a decent
breath of pure air. Possibly your
yards have not been spaded or puri-
fied with a green crop for several
years, or the droppings are allowed to
lie on the droppings boards till the
fowls are poisoned by the odor. Clean
up; give your birds pure air at night;
isolate the sick ones, and band each
one that recovers so that it will never
be used for breeding.

Culling Early Molters

In July 3 issue of your helpful paper
you say cull out early molters. This,
I judge, applies to the Leghorn. Some
of our White Rock early molters have
been splendid layers. Does your rule
mean to cover Rocks?—Subscriber,
Upland.

Very likely these White Rocks are
the exception that proves the rule.
The color test applies only to yellow
shanked birds, but the early molting
test is understood to apply to all. In
the case of hens that have raised a
brood in the spring I doubt if it would

apply, for a hen that has been allowed
to sit sometimes molts before she goes
back to laying, but in general I be-
lieve you will find the rule holds.

Okanogan County, Washington, is
suffering severe losses because of
grasshoppers. The legislature has ap-
propriated \$3,000 to aid in the fight.

6% SAVINGS ACCOUNTS

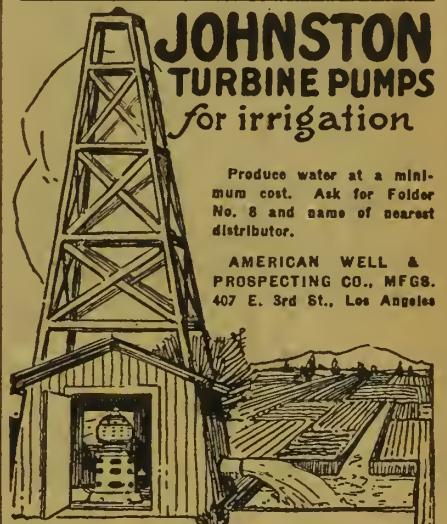

Systematic saving is the road
to success. Safety of principal
and interest are assured under
our Partial Payment Savings
Account Plan. You purchase, by
small payments, a California
Municipal Bond, the payment of
principal and interest of which
is accomplished by the County
through the collection of taxes.
We pay you 6% on your balance
during the time you are making
your payments; the County
Treasurer pays you 6% on the
face value of the Bond there-
after until it is due.

Let us explain in detail. Mail

Harvest 20 to 45 Bushel to Acre Wheat in Western Canada

Think what that means to you in good hard dollars with the great demand for wheat at high prices. Many farmers in Western Canada have paid for their land from a single crop. The same success may still be yours, for you can buy on easy terms.

Farm Land at \$15 to \$30 an Acre

located near thriving towns, good markets, railways—land of a kind which grows 20 to 45 bushels of wheat to the acre. Good grazing lands at low prices convenient to your grain farm enable you to reap the profits from stock raising and dairying.

Learn the Facts About Western Canada

—low taxation (none on improvements), healthful climate, good schools, churches, pleasant social relationships, a prosperous and industrious people.

WHERE CROSS THE CROWDED WAYS

'Tis only a half truth the poet has sung
Of the house by the side of the way;
Our Master had neither a house nor a home,
But he walked with the crowd day by day.
And I think, when I read of the poet's desire,
That a house by the road would be good;
But service is found in its tenderest form
When we walk with the crowd in the road.

So, I say, let me walk with the men in the road;
Let me seek out the burdens that crush;
Let me speak a kind word of good cheer to the weak
Who are falling behind in the rush.
There are wounds to be healed, there are breaks we must mend;
There's a cup of cold water to give;
And the man in the road, by the side of his friend,
Is the man who has learned how to live.

Then tell me no more of the house by the road,
There's only one place I can live;
It's there with the men who are toiling along,
Who are needing the cheer I can give.
It is pleasant to live in the house by the way,
And befriend, as the poet has said;
But the Master is bidding us: "Bear ye their load,
For your rest waiteth yonder ahead."

I could not remain in the house by the road,
And watch as the toilers go on,
Their faces beclouded with pain and with sin,
So burdened, their strength nearly gone,
I'll go to their side; I'll speak in good cheer;
I'll help them to carry their load;
And I'll smile at the man in the house by the way,
As I walk with the crowd in the road.

Out there in the road that goes by the house
Where the poet is singing his song,
I'll walk and I'll work 'midst the heat of the day,
And I'll help falling brothers along.
Too busy to live in the house by the way,
Too happy for such an abode.
And my heart sings its praise to the Master of all,
Who is helping me serve in the road.—
Walter J. Gresham.

CONTACT WITH THE ENEMY

(Concluded from last week.)

Crouching in one end of the short bend, he loosened the flap that held his automatic; he rested his rifle in front of him.

The gun on his left was now firing in little bursts of two and three shots. Soon it ceased altogether. Somewhere behind the German lines an ammunition dump was burning with a dull red glow. Dick peered into the darkness ahead of him. He had ceased to shiver.

Suddenly out of the night three grotesque shapes loomed up in front of the boy not a dozen yards away. He threw his rifle to his shoulder and fired into their midst. He saw one of them fall. Rushing immediately to the other end of the trench, he drew his automatic and fired two shots in quick succession; then he leaped out and ran forward. The two figures threw up their hands; expecting to find only one American, they had been fired on from two points.

For a moment Dick was confused as he stood in front of his two prisoners. What should he do with them? He could not kill them; but he must do something and do it quickly. The prisoners doubtless were armed, and he did not dare approach near enough to take their weapons. Beside the trench lay the twisted machine gun barrel. With his automatic held out threateningly, he advanced a step and pointed to the piece of twisted iron.

"Put it on your shoulders!" he commanded in a low voice. "Quick! Auf die Schulter!"

They bent over and swung the heavy gun barrel to their shoulder and steadied it with both hands. Dick then indicated the direction of the strip of woods. They were about to start toward it when a long-drawn outcry came from behind. Dick turned with a start; then he remembered—the third member of the German patrol. Again came the cry, not so loud this time, but ending with a deep groan. Dick hesitated. Could he leave a wounded man—even a German—to lie in the open and suffer? Yes, he could, he told himself with fierce conviction; and he faced about just in time to catch the larger of his two prisoners in the act of lowering one

hand from the machine gun barrel.

"Keep your hands up!" the boy commanded, and his finger trembled on the trigger of his automatic.

Both Germans were big men, but he could plainly see their chests heave and hear their breath come in short gasps as, with his body bent aggressively forward, he held the gun on them. The cry sounded again behind him. With all the caution he could command, Dick manoeuvred his two prisoners with the twisted barrel on their shoulders back to the place where the wounded German lay. The man was lying face downward, with his left arm under him. The boy noticed that the fellow was short and rather thin. The German trembled all over as Dick bent down and removed the grenades from his belt. The bullet had apparently passed through his shoulder, and he made no effort to conceal his pain.

After disarming the wounded man Ellis had planned to make the two prisoners carry their comrade. "Put that down and pick him up!" he commanded, pointing to the wounded man.

The larger of the two glanced quickly back, and Dick thought he heard him speak under his breath to his comrade. The shorter man grunted. The grunt may have meant nothing at all, but the boy was suspicious. Just as the two Germans were about to lower the gun barrel to the ground, he said, "No! Keep it there! Auf die Schulter halten!"

The two men held fast to the gun barrel, for Dick's automatic was full of meaning.

It was an awkward situation, and the boy realized it. Both men were armed with grenades in their belts and perhaps with other weapons that he could not see. Furthermore, they were well trained fighters. He dared not approach near enough to search them thoroughly; lest they try to grapple with him. What could he do?

"If I let them put down that machine gun and bend over the wounded man, one of them's likely to sling a grenade," he thought. "No. It's too dark, and it's too risky."

Again the wounded man groaned. Still covering his two prisoners, Dick stooped to his knees, seized the wounded man by the wrist and with a quick twist threw him upward so that his right armpit rested on Dick's right shoulder. Then he rose to his feet with the man slung across his back. His burden was by no means light, but he could handle it.

Again he indicated the direction of the little strip of woods, and the two prisoners, walking close together with their hands steadying the twisted gun between them, started forward. Dick followed a few feet behind and a little to one side. Not for an instant did he take his gun off the men in front of him.

The wounded man on his shoulder had ceased to groan; he seemed to have lost consciousness. The two machine guns that had been so active half an hour ago were now silent, and the harsh crunch of heavy hobnails on loose stones and the splash of unseen puddles sounded unnaturally loud even in the pouring rain. The booming of the heavy distant guns seemed a part of the stormy night.

They were going uphill, and Dick was breathing hard. He adjusted the wounded man higher on his shoulder as he went along, and the German uttered a slight groan. They were within fifty yards of the little strip of woods at the crest of the hill.

A flare went up far to the right, and Dick turned his head to glance at it. At the same instant, with fingers of steel, the wounded man clutched his throat. The suddenness of it threw Dick into a panic. He stumbled ahead. The man's fingers sank deeper into his throat; Dick felt the sharp nails bite into his skin; his breath was cut off. Letting go the man's wrist he tried to tear the fingers away with his hand, but like a flash the man had him by the throat with both hands. Dick staggered on. His mouth was open, and he felt his eyes starting from his head. Instinctively he clung to his automatic. The two Germans ahead were apparently unaware of the silent struggle, but how long would they remain so? Confused thoughts surged through the boy's mind; he

was choking; his helmet slipped off and splashed in a puddle.

He staggered on another step and in an agony of pain dropped to one knee. His head throbbed, but the fingers about his throat tightened. When he raised his automatic, the German clutched at it with one hand, missed it by less than an inch, and then sank his fingers into the boy's throat again. As he did so he uttered a loud cry to his comrades ahead.

Dick heard the cry only faintly, but it served as a stimulus to his confused brain. He reached behind him with the muzzle of his automatic, felt blindly until it touched the body of his enemy and pulled the trigger in desperation.

The sharp report threw him forward, and his burden slid lifeless to the ground. Dick regained his feet, gulping and shaking his head as the sound of his shot echoed and re-echoed in his ears; in a moment or two his mind was clear again, though his throat, torn and bleeding, seemed as if stung by a thousand needles. A short distance ahead of him plodded his two prisoners. They had heard the cry, followed instantly by the shot, but they had not dared to look back. What they thought, Dick never knew. He held his automatic again in readiness.

A few minutes later they passed through the strip of woods, and Dick breathed easier. The American sentry who halted the trio just outside the American lines was almost too astonished for words. When Dick had turned his prisoners over to a sergeant, together with his sketch for battalion headquarters, he examined his automatic. A low whistle escaped him. The chamber was empty! Hastily he refilled it.

DESSERTS FROM DRIED APRICOTS

Many people who never dried apricots before are drying them this year instead of canning, because of the excessive price of sugar. More would perhaps if they realized there were other ways of serving them than stewed. Here are a number of recipes for using in dainty desserts, prepared by the Sunsweet apricot people, who are, of course, the Prune and Apricot Growers Association, who are, of course, ourselves, if we happen to be wide awake apricot growers:

Apricot Pudding

In a double boiler scald one and one-half quarts of sweet milk and stir in four teaspoons of sago. Let stand until sago is quite clear; add three beaten eggs, one-half cup sugar, one teaspoon lemon essence, a little butter and a pinch of salt. Add two cups of hydrated apricots. Bake 45 minutes. Serve hot or cold, with or without cream.

Baked Apricot Whip

Wash well one-half pound apricots and stew over fire, stirring slowly until the water has all evaporated from them. Then chop or put through a colander and add one-half cup of sugar and set over the fire until the sugar melts. Still well and then set to cool. When cool add this to the stiffly beaten whites of six eggs. Turn into a well buttered cake mold and bake in a moderate oven for one-half hour. Turn out on a plate and allow to cool. Serve with whipped cream.

Apricot Foam

Stew until tender one pound of apricots. Drain and then rub apricots through a sieve. Beat the whites of six eggs to a stiff froth, until it is smooth, thick and velvety. Pour into a mold, which must be placed on ice. Serve with sweetened whipped cream.

Jellied Apricots

One quart of stewed apricots, three-fourths cup of sugar, one tablespoon of lemon juice, one box of gelatine. Make a syrup of the sugar in the juice of the apricots and lemon juice; boil two minutes. Dissolve the gelatine in the water, strain and add the syrup and the fruit. Turn into molds and wet with cold water and let stand until ready to serve.

NO CHANCE

Judge: "The policeman says you and your wife had some words."

Prisoner: "We both had some, Judge, but I didn't get a chance to use mine."

THIS WEEK'S PATTERNS

Two dainty print dresses for the small girl top the column of this week's patterns. We never had mere charming prints than are shown at present and now during the summer season one can often pick up a remnant of sufficient size for a small garment at reasonable price.

The dress 3265-3252 has exceptionally good lines. The decoration as applied in this illustration may not appeal to many, but there is a good foundation for originality and adapting to one's own style. We recently saw a charming white Indian head worked out in a similar design, the embroidery of brightest Turkey red with line of black to give it body. This, worn by a dainty little brunette, was quite the most fetching thing on the beach. Note this pattern is in two parts, waist and skirt, each ten cents, both 20.

A beautiful and practical combination slip is shown in 3264. Every woman's ideal is, of course, to have an underslip fitted to each gown. This, however, would be usable for many. The back closing may be omitted and the garment slipped on over the head if the waist is not fitted closely, as it should not be for the present mode.

A very pretty, easily made, easily slipped on and easily laundered work apron or dress is shown in 3263. The slight butterfly draping of the kimono sleeves gives a dainty touch which would adapt the pattern to use as a negligee in silk, voile, challis or similar soft material. With pockets omitted and sash or belt added, it is a practical girl's dress. Such a simple and adaptable pattern should always be at hand in your exact size, so as to be instantly available. Without the pockets it would also be an unusually good night dress. When you use it for the first time, if you find a quarter inch longer or shorter on the shoulder or sleeve is necessary for you, be sure to mark clearly on the pattern, so that future recutting and fitting is unnecessary.

WOULD YOU WAIT FOR PERMISSION?

What do you think of having to telephone for permission to run from a flock of bears—and then having your more or less palpitating proposal turned down?

That is what happened to J. W. Hodge, a fire guard on the Shenandoah national forest, a few days ago.

Hodge was stationed at the lookout tower on Hankey Mountain. It was his job to scan the skyline and to make expert diagnosis of far away smoke smudges or any other indication of fire in the forest. This particular morning when he went to the lookout tower on the mountain top, he failed to attach his gun to his person. It was a mere formality, anyhow, and guns are cumbersome things to carry around.

Well, he got into his lookout box and began searching the dim blue distances that look like the further fringes of the world. He was very busy at that for a while. Then his eyes came back closer home and what he saw made him wish for an airplane to take him immediately to one of those far fringes. Three bears were browsing around only a little distance from his lookout tower. They were not apparently giving him any thought, but he did not know how soon they might become hungry. There being no airplane at hand, he decided to use his legs.

Then he remembered he could not leave his post without permission, so he called up District Ranger Shanklin, laid the case before him, and requested permission to go for his guns. He was promptly told that the thing was impossible. The forests were dry and fire might start anywhere at any time. Bears or no bears, it was Hodge's business to stay in that lookout box. Being a perfectly good forest guard, he stayed. Fortunately another lookout happened to listen in on the telephone conversation and succeeded in sending help to Hodge.

Taste and Smell—There are many persons who are able to recognize oleomargarine, almost without fail, by taste and smell alone. The flavor and odor of both oleomargarine and butter become more apparent and characteristic upon melting the fat. These tests can readily be applied while performing the spoon test.

Fairbanks-Morse "Z" Farm Engines

KEROSENE

takes the place of distillate. The fact that there is no more distillate to be had does not bother the "Z" engine owner. The "Z" is designed to use kerosene and operates as well on gasoline. This inbuilt adaptability has won for it the approval of over a quarter million farmers.

Such widespread acceptance of the Fairbanks-Morse "Z" Engine was not achieved by claims alone. Nor by the high repute of the house which manufactures this phenomenal farm engine. Over \$15,000,000 was paid by farmers for "Z" Engines because of *Quality* which makes for service—and performance—and surplus power—and enduring farm engine dependability.

Equipped with Bosch Magneto. Thousands of "Z" dealers furnish Fairbanks-Morse service to every engine buyer. See your dealer today.

Prices: 1½ H. P., \$75.00; 3 H. P., \$125.00; 6 H. P., \$200.00. All F. O. B. Factory.

FOUR ROW AUTOMATIC LIFT BEET PLOW

Killefer
Efficiency

It Is None Too Early To Plan For Beet Harvesting

The above cut showing our Four Row Automatic Lift Beet Plow, the most practical beet plow on the market today, was designed for use behind the larger size tractors for plowing out beets at a minimum cost and saving not only time, but plowing deep enough to get the tap root, which contains the greatest percentage of sugar.

The value of a good implement of this kind is not only in its ability to perform a perfect job of beet lifting, but in the condition it leaves the ground for next season's crop. Subsoiling has proven very beneficial on the Pacific Coast soils, and a good job of beet plowing is nothing more or less than subsoiling.

Our beet plow is equipped with either the straight wings as shown in the cut, or with angle wings, whichever is preferable.

Place your order early, for, owing to the shortage of steel, there will be a limited number of these beet plows available.

Price f.o.b. Los Angeles, \$575.00

Oranges: Supplies liberal, market firm. Valencia's; packed special brands, 126's 5.50@6.00; 150's and 176's 5.75@6.25. Local packed, mostly 4.25@4.75; larger sizes, low as 3.00. Packing house culls, 1.00@2.00 per lug.

HONEY

Old honey practically exhausted, new supply light; few sales; demand good movement limited. Carloads f. o. b., usual terms. New crop orange, 21; Hawaiian it. amber, 17½. Old crop white amber sage, 19; wh. alfalfa, 19½. Beeswax, 42.

HAY

Alfalfa Growers of California, under date of July 14, says:

Continued active demand for alfalfa hay, with diminished offerings by growers, led to sharp bidding by buyers in most parts of the state; this demand is principally for forward shipment for the purpose of stocking up for winter consumption. Prices in the different markets of the state ranged from about the former level to a dollar or two higher. The period of heavy marketing by growers is now drawing to a close and offerings from first hands can be expected to gradually taper off from now on, as usual at this time of the year. The unsold stocks in growers hands are so far rather light in most sections, and the majority of growers, being already booked ahead and having to look out for their own requirements during winter, are now waiting for the result of the remaining cuttings and in the meantime are going slow in offering their marketing surplus. During the week of July 10 there were received 1,700 tons on the Los Angeles tracks of all grades as compared with 1,500 for the week ending July 3.

Southern Prices:

Choice alfalfa	41.00
No. 1 dairy alfalfa	36.00
Standard dairy	33.00
Stock hay	29.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	25.00@27.00
Barley	18.00@24.00
Alfalfa	26.00@32.00
Barley straw	8.00@10.00

GRAIN AND FEEDS

A little weaker, especially in spot stuff. There is a great range in price because of vast difference in quality.

Milo: Good bright, Imperial milo commanding No. 1, 3.50 and Eastern milo is running around 2.80 to as high as 3.17 for best stock.

Spot bran, Northern, 65.50 per ton.

Bran, Kansas, 61.00 per ton.

Wheat: Utah-Idaho Milling, 6.00; feed wheat is running around 4.45@4.55.

Corn: Sacked, Yellow, 3.65 to 3.71.

Barley: No. 1 Feed, 41 lb., 2.77@2.83.

Barley: Export 46 to 48 lb., 3.10@3.30.

Wheat: Mixed feed, 6.05@6.35.

San Francisco Markets

San Francisco, July 13, 1920.

BEANS AND PEAS

California Bean Growers Association, San Francisco, July 10:

There has been no material change in the California bean market since our last report to you and we do not look for much activity until the latter part of this month or, perhaps, next month. Quite a little interest has been shown recently in California Pinks but the White varieties have been very inactive. The trade here is offering for shipment at about the following prices:

Large Whites 6.15@ 6.30
Small Whites 5.75@ 6.10
Pinks 6.65@ 6.75
Cranberries 6.75@ 7.00
Black Eyes 8.25@ 8.50
Red Mexicans 8.25@ 8.50
Red Kidneys 14.00@14.50
Bayos 10.25@10.50

HOPS

1919 crop, 85@1.00 per lb. Prices to growers for 1920 crop, 65@80 per lb.

HONEY

Reported by Rafael & Wing:
Very little honey arriving. Not enough sales to establish prices. White orange offering in this market at 20@21. No change in wax. It is bringing from 40 to 42. From all indications, there will be a very good honey crop from the San Joaquin and Sacramento valleys. The sage crop in Santa Clara and San Benito counties is practically a failure. Some Honolulu honey offering, but not enough to affect the market.

GRAIN

Wheat: 4.25@4.40.
Oats: Red feed, 3.00@3.15.
Corn: California Yellow, 3.65@3.75 per cental; California milo maize, 3.50@3.65.
Barley: No. 1 feed, 2.75@2.85.

HAY

Under date of July 10, A. W. Scott Co. says:

Receipts past week 1,988 tons. No purchasing in any amount has been done and the consumer still declines to purchase in advance at prices asked. The readjustment and moving about of baling rigs through the cutting of large quantities in regular grain districts has delayed shipping and prevented large quantities of hay from coming in which would by this time have been shipped here. Country trading is equally dull. Alfalfa is relatively stronger than any other hay but during the week reports of sales at lower figures have come from several sections. Export is slow and affected by the general dull market conditions with a tendency on the part of buyers to wait until later in the season before placing orders in quantity.

We quote today wholesale prices in carload lots (old crop) as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.)

Old Hay:
Prices nominal. Old straw nominal.
New Hay:
Wheat hay (light 5 wire bales) 26.00@28.00
Tame Oat hay 26.00@28.00
Wild Oat hay 20.00@22.00
Barley hay 20.00@23.00
Alfalfa hay first cutting 20.00@25.00
Alfalfa hay second cutting 24.00@28.00
Alfalfa Growers of California quote prices for Northern Districts:
No. 1 dairy alfalfa 33.00
Standard dairy 32.00
Stock hay 28.00

Newcastle reports infestation of phylloxera in one of its vineyards.

Citrus Markets

Los Angeles, July 14, 1920.

Valencias have been against vast quantity of Eastern small fruits and California cantaloupes and the market is generally lower. Good stock, however, is commanding ready sale and at ready prices.

Lemons are still in the dumps and it now appears that they cannot command any exceptionally long prices this season.

Shipments

Shipments of oranges to date from Southern California since November 1, 1919: Oranges, 24,510 cars; lemons, 6,260; total, 30,770. To same date last season: oranges, 27,269; lemons, 7,777; total, 35,046. From Central California to date this season: Oranges, 5,374; lemons, 288; total, 5,662. To same date last season: Oranges, 3,714; lemons, 251; total, 3,965. Northern California this season: Oranges, 261; lemons, 23; total, 284. To same date last season: Oranges 244; lemons, 2; total, 246.

INCREASING FARM POWER

Mr. Hawkins of the International Harvester Company informs us that the International motor truck has increased its sales volume 1,500 per cent since 1914 and plans are now forming by which greatly extended production will enable more rapid extension in the future. A new plant is to be erected at Fort Wayne, Indiana. This in addition to the Akron works. The Fort Wayne people under the direction of the chamber of commerce are now completing the first quota of 1,000 cottages for use of the laborers of the institution.

"The buildings of the new plant will embody the improvements of every important modern automobile and motor truck plant in the United States. It is the determination to combine all noteworthy individual merits of America's successful manufacturing establishments into this super truck plant in order to make it as nearly perfect as practical and scientific ingenuity can devise. Health and comfort of the workers and ease, efficiency and perfection of work will be the major ends involved. The machinery and equipment will follow the same principle and no expense or pains will be spared to equip the great plant for the happiest and most satisfied workmen and for making the best and most economical motor truck which can be built."

TRACTOR PAPER

Tractors "on time" has hardly been possible with the immense growth of the industry and the consequent demand on the manufacturer for every dollar at his command to carry the great stock necessary. All the producer's capital was likewise invested to the last cent possible in equipment and seed, under the past few years' urge, and this demand has made it practically impossible to accumulate the thousand dollars or more which is necessary to purchasing a farm tractor. Now come credit companies making a specialty of financing the manufacturer, or, in other words, buying the paper which farmers put up for purchase of this expensive equipment. The paper is turned directly to the credit company by the tractor manufacturer, the money is placed in new steel and takes up its continual circulation.

Actual tests

By exhaustive study and engine tests, our Board of Lubrication Engineers has determined the correct consistency of Zerolene for your make of automobile. Its recommendations are available for you in the Zerolene Correct Lubrication Charts. Get one for your car at your dealer's or our nearest station. Use Zerolene for the Correct Lubrication of your automobile, truck or tractor.

A Tree Which May Some Day Be Historical

Overland

TRADE MARK REG

Stamina

STAMINA is the power to suffer blows without succumbing. The Overland, on the new *Triplex* Springs, has lasting strength and staying powers because it has in-built stamina.

A Year's Abuse In Seven Days

March 3, 1920, a stock of Overland finished a test run of seven days and nights over frozen Indiana country roads. It traveled 5,452 miles in 168 hours continuously. Yet under this ceaseless pounding it never failed or faltered and finished ready to run the gauntlet again.

Blazing the Trail for the Army

From July 7 to September 6, 1919, three stock Overland cars blazed the trail for the U. S. Army Engineers in their famous cross-continent drive. These cars covered almost impassable roads in all kinds of weather and in all altitudes. They proved again the marvelous stamina of the Overland, the modern light car.

42,104 Foot-Pounds Blow on Springs

Daily at the last annual Stock and Horse Show at Denver, Colorado, a stock Overland leaped eighteen feet, clearing a five-foot hurdle. In landing it sustained a blow of 42,104 foot-pounds on its spring system. On *Triplex* Springs, designed to ward off the jolts and jars of the roughest roads, it emerged with not so much as a cracked shackle bolt.

Races 25,000 Miles in Pursuit of Speeders

The Houston, Texas, police use an Overland day and night in pursuing "speeders." Since October, 1919, the car has covered more than 25,000 miles, much of it at 35 to 45 miles an hour. And in that time there has been absolutely no expense for mechanical upkeep. Because this car has never failed its drivers, six more Overlands have been purchased for similar arduous work.

YOU never would want to put your car through such punishment, but it is gratifying to know you *could*. Power plant and body are cradled upon the marvelous *Triplex* Springs, which create riding qualities undreamed of in a light car. They lower upkeep costs. They guarantee Overland Serviceability.

Rambling Along the Edges of Rice Paddies

By C. B. Messenger

RECENTLY blew into Chico in Butte County, county of rice. I say "blew in," but perhaps, more correctly, melted and ran in, for it was the kind of a day the rice growers love to look upon. I had been up in Shasta and noted there what Shasta producers hope will be the beginnings of a great rice industry for that county and had a ride over hills and amongst the pine trees and down through the great Stanford ranch at Vina and over wonderfully rich acres of Shasta, Tehama and Butte Counties and I was fully impressed with upper Sacramento's rich possibilities.

The first one encountered was Secretary Frank Durkee of the Chamber of Commerce, and Chico has a real Chamber of Commerce and, I may al-

ticular moment and with true Sacramento Valley hospitality the dust of travel was overlooked and I was made a welcome guest at a delightful luncheon. And here is where I learned as to some of the real activities of the Chamber of Commerce and my opinion was formed that it should be renamed and "Agricultural" added. The attendance at the luncheon showed that the commercial interests of the community are even secondary to the larger, more inclusive, soil products interests. Its president, Dr. E. B. Copeland, is one of the larger rice growers of Butte County. Other members have large farm holdings. The cordial welcome and the spirit of the county was shown by Dr. Copeland's

is just being applied to cover for the season. The illustrations on this page give more graphic idea to one not familiar with rice cultural conditions than anything I may say. First we drove south of the town, seeing scores of pumping plants only recently in-

seriously infested paddies as high as \$20 per acre.

Dr. Copeland is breaking in a new section which heretofore had been considered a fruit or grain section. It is west of Chico, not far from the Sacramento River, where a battery of wells supply water for several hundred acres. The illustrations in this column were made on this ranch.

Disseminator of Weed Pests

One of the smaller supply canals in Butte County lined and filled with water grasses, cattails, willows and other pests of the rice fields.

most add, of Agriculture, that is true to the entire interests of its own community and of the Sacramento Valley, and that means it does all in its power to advance the interests of the farmer and the fruit grower. I was scheduled to stop in Chico but an hour or two but Mr. Durkee referred to the monthly luncheon of the Chamber of Commerce which was due at that par-

remark, as soon as the various reports and discussions before the organization had been disposed of, by his offering, even in view of the already strenuous gas shortage, the use of his machine for the afternoon, and still better his own company.

I saw rice as never before, as far as the eye could reach, mile after mile of rice fields in the stage where water

Rice Just Coming Under Water

Water will now be held over the entire field for from 60 to 90 days. The light color in the field immediately back of the rice in the foreground is wild oats, but through this is a good stand of rice and the water will need to be held on the field but a few days before oats will begin to go down.

stalled, then farther into the Nelson, and to where we could overlook Richvale and Biggs sections. On Dr. Copeland's own place near Nelson was seen one of the cleanest paddy fields of the day's trip. By cleanest we mean freest from those distressing weed pests, the water grasses, sedges,

Across the river in Glenn and Colusa Counties the rice growing campaign seems to be even intensified. This section was not as early in the game in a large commercial way as was Butte County. County Horticultural Commissioner Wrenn of Glenn was guide and counselor in this section.

One of a Battery of Efficient Pumping Plants

Dr. E. B. Copeland, the one in lighter shirt, and associate, in front of one of the pumping plants of a battery of five on the ranch west of Chico, which is a pioneer in a new rice section. This ranch is somewhat different from many of the old time rice fields in that it is not underlaid with hardpan and the soil is more or less of a loamy nature.

cat tails, docks and some of the other plants which revel in water and foul the land. The method of weed control is simply hand pulling. Dr. Copeland's work is in charge of a corps of Filipinos. The grasses are simply pulled after the water is applied, the boys going through the field either in rubber boots or barefooted as they prefer. The cost may be as low as \$4 or \$5 per acre or in exceptionally

Across the river at Hamilton City, and from there down to Willows, we passed through thousands of acres of rice fields. The most astonishing feature of this short ride was the powerful pumping plants, lifting literally rivers of water from the great Sacramento. The Sacramento increases one's respect for it wonderfully as he sees the wealth it carries to these Glenn and Colusa lands.

(Continued on Page 119.)

Measuring the Water to the Users

Meters admitting the water to one hundred sixty. Many districts, however, are not so careful in distribution and division of water.

Agricultural News Notes of the Pacific Coast

Northern California

Orland, Glenn County, is building a \$50,000 schoolhouse.

Hop picking in Yuba County will start about August 5.

A shipper of scabby sheep was last week fined \$50 in San Francisco.

Willows, Glenn County, will pave eight miles of streets before 1921.

The first carload of Bartlett pears from Yuba County was shipped July 3.

Vacaville, Solano County, shipped 82 carloads of fruit during the first week in July.

Butte County supervisors appropriated \$1,500 to aid farmers in fighting grain fires.

Alameda County's apricot growers have sold the most of their crop around \$100 per ton.

Hamilton City, Glenn County, is building a city lighting system and paving several streets.

Tehama County residents have raised \$10,000 with which to hold a county fair in October.

An irrigation district of 6,000 acres north of Thermalito, Butte County, was perfected last week.

The supervisors of Placer County have appropriated a sum sufficient to continue the farm adviser through his second year.

In Siskiyou County a movement has started to divert water from Klamath Lake and Klamath River to irrigate Shasta Valley.

Hayward, Alameda County, is making plans for a farm products show which the committee announces will be "one hummer."

The first trainload of seed peas raised in the Sacramento delta lands was shipped East last week. Several more trainloads will follow.

Various sections of Northern California report the death of domestic geese from eating Johnson grass containing prussic acid.

Shortness of grazing in northern districts is responsible for death of livestock through eating poison hemlock, wild tobacco and larkspur. Enclosed pastures should be cleared of these plants.

F. A. Ursua of the Argentine embassy at Washington, after a cattle survey in California, will recommend to his country adoption of California laws for protection of the cattle industry.

Placer County plum growers are investigating the shortage in the plum crop. Some think it due to the wearing out of the soil; others to the exceptionally warm winters during the past two or three seasons.

The slump in the wool market caught many of Sonoma County's wool producers, who refused to sell at present low prices, and Cloverdale reports warehouses full. The farm bureau shipments are being made to Chicago.

Manager Riley of the Pacific Rice Growers Association has just finished inspection of the rice districts of Sutter, Yuba, Colusa, Glenn and Butte Counties and says that the yield promises to eclipse that of former years in spite of the dry season.

Colusa County reports rice not in best condition, largely because of cool spring and shortage of water. "The water grass is very bad around here and many growers have let their land lie idle this year, as they had too big a crop of grass seed instead of rice."

Central California

Help prevent fires.

California's 1920 crop will average much below normal.

"Sunsweet" prunes will sell around 18 cents for standards.

San Jose reports extra fancy Moorpark quoted at 33 cents.

Fruit shippers are organizing a cooperative association at Fresno.

Stanislaus County has appropriated \$1,000 for exhibit at the state fair.

Modesto's new cooperative cannery is now ready for the season's run.

The first watermelons from the Turlock district this season were shipped July 11.

San Jose reports some apricot growers as having sold canning fruit at \$110.

Tulare cannery is running full handed on peaches. It will process 2,000 tons.

Fresno creameries paid five cent higher price for June than for May butterfat.

The Pajaro district of Santa Cruz County has just organized a farm bureau center.

Modesto, Stanislaus County, is to have a dehydrating plant. It will cost nearly \$7,000.

Fruit and vegetable canneries have arranged wage of \$4.60 per day for adult male labor.

Porterville, Tulare County, has over 800 acres in cantaloupes. "Fine quality, situation inviting."

The California state dairy council recently held a two day meeting at Hanford, Kings County.

President Giffen of the Associated Raisin Company has been East investigating marketing conditions.

Nurseries of the central part of the state report nursery stock will be fully as short next year as it was last.

San Joaquin Valley horticultural commissioners recently met at Fresno and discussed standardization.

The Melvin Fruit Growers Association is building a new shed and warehouse near Clovis, Fresno County.

Some of the wheat on Tulare's bottom lands has been running as high as 44 sacks per acre, barley 50 sacks.

Turlock's cantaloupe crop on irrigated lands is doing exceptionally well; unirrigated fields not doing so well.

Kings County board of supervisors is planning a general county exhibit of agricultural products at state and other fairs.

Turlock reports sufficient help for handling the coming cantaloupe season. It is estimated that section will ship about 3,000 cars.

Sales Manager Sturtevant of the California Peach Growers, back from Eastern trade centers, has optimistic report for dried fruits.

Fresno County farm bureau meetings: Wood Colony, July 19; Laurel Lodge, 19; Turlock hog auction, 20; Hickman-Waterford, 21; Ceres, 22; Patterson, 23; Orange Blossom, 26; Claus, 28.

Fresno County farm bureau has just closed the third year of its existence. Among other work reported taken up are campaigns for silos, rabbit drives, cow testing association, hog auctions, good roads, cotton culture.

Southern California

Help prevent fires.

Imperial County's cantaloupe season has ended.

Almost everybody signed the highway bond petitions.

West Riverside is growing cotton, which is now in full bloom.

Nearly all citrus sections report promise of bumper orange crop.

"No gas" is the usual sign in all sections of Southern California.

The Valencia market is exceptionally good; lemons disastrously low.

Two hundred acres of grain went up in smoke at Arlington last week.

Imperial Valley's production this year will aggregate about \$75,000,000.

Orange County poultrymen are taking lessons in "culling out the boarders."

Southern California's beach resorts were treated to a great spectacle in high tides.

Pomona irrigators have installed a new compressor which will increase the irrigation supply.

Pomona district reports no restrictions at this time on farm power for pumping or other farm use.

Citrus fumigators held convention Friday, July 16, at Covina, and hold another at Pomona this week.

Palo Verde Valley is making a campaign for production of Durango seed, with the promise of \$200 per ton.

Arlington, Riverside County, reports "apricots larger in size, finer in quality and more canners than usual."

San Bernardino County is maintaining an exceptionally fine system of highways to her mountain resorts.

Foothill Honey Producers, whose season ends about July 1, find the harvesting continuing longer than usual.

The Pasadena Horticultural Society has announced the holding of an autumn flower show, October 28, 29, 30.

Governor Stephens has replied to request that he place an embargo on gasoline that the state has not the power.

The Ventura County farm bureau has joined in the drive to secure funds for protecting the Santa Barbara national forest from fire.

La Verne, Los Angeles County, is building orange packing house, 180 by 137 feet, with basement and strictly up to the minute equipment.

Orange growers have been pleased with the season, there having been no hot spell to cause the usual June drop. An advanced guess on the coming crop is that it will be larger than normal.

California Lima Bean Growers Association has paid to members above eight cents per pound for last season's delivery. It is predicted the final payment will bring the total up to about 9½ cents.

Willis S. Jones of Claremont reported at the Riverside frost protection conference: "Frost protection does pay for itself. In the years I did not protect my groves I lost sufficient to pay for a 50 year frost protection campaign."

At the meeting of county assessor, board of supervisors and date growers of Riverside County the board suggested that in assessing bearing date trees a valuation of at least \$50 for four year old date trees would be fair. The growers protested that such valuation would be excessive.

The Coast and General

Help prevent fires.

Pluma County, Arizona, is having a silo building campaign.

The county agent of Yuma County, Arizona, is making a campaign against Johnson grass.

The Indian women about Elko, Nevada, have formed a labor union and adopted a scale of wages.

The price of retail milk was advanced July 1 in Phoenix, Arizona, to 17½ cents a quart for B grade milk.

Arizona wool growers have asked for embargo on further importations of beef, mutton or wool for the present year.

Wool prices in Lake County and district in Oregon have dropped during the past month from 55 to 41 cents.

Kennewick, Washington, shipped 15,000 crates of strawberries during the past season, one grower netting 1,200 crates from five acres.

The state department of agriculture reports information from the East that some 13,000 new refrigerator cars are to be added to California's fruit carriers.

Win. Ladd of Portland, Oregon, reports a Jersey cow producing 999 pounds of 85 per cent butter within 12 months. Her name is Adelaide of Beechlands.

Because of a recent ruling of the Salt River Valley Water Users Association in Arizona, 40,000 acres will be covered by the waste waters of the Roosevelt dam.

A terrific storm visited the Inland Empire of Eastern Washington, ruining thousands of acres of crops, uprooting orchards and razing many farm buildings.

Dairymen of Whatcom County, Washington, recently held annual picnic and made "Jersey excursion" into some of the more important Jersey sections of the county.

C. C. Cragin has been appointed project manager of the Salt River Valley Water Users Association. Mr. Cragin succeeds W. R. Elliott, who resigned to enter business as a civil engineer.

Jackson County, Oregon, farm bureau has recently purchased warehouse for storage of grain, poultry, eggs and other farm products and to serve as distributing station for needed supplies.

Although the cotton picking season in the Salt River of Arizona does not open until well into September, E. P. Satterfield, living south of Phoenix, is showing some matured cotton bolls of the 1920 crop. These are from a field of volunteer or "rattooned" cotton.

The first car of cantaloupes in the Salt River Valley was shipped July 1. This is a little later than last year. Prospects are that while the acreage of cantaloupes is somewhat less than last year the crop will be better, so that total shipments may almost equal those of 1919.

The summer rains on Arizona ranges have not been sufficient to prevent the drying out of pastures to some extent. The soil of most ranges, however, was well saturated so that on the whole range conditions are very fair. There have been some showers in Apache and Navajo Counties and Mohave County, near Kingman.

DIFFERENT plants differ in the mechanism of the roots which absorb the water. Many roots are equipped with multitudes of very fine hairs that in the total give a tremendous absorption surface. Other roots consist only of smooth fibers which do most of their absorbing of water through that portion of the rootlet near the end. The citrus root belongs to this latter class and it is thus less perfectly fitted for rapid absorption of water than certain other plants. Under our arid conditions it is imperative to the well being of the citrus tree that a vigorous and continuous development of fiber roots be encouraged during the spring and summer season.

As a general rule, water does not come to the rootlets in position in the soil, but rather the rootlets must seek out the water. It is quite probable that a very few days after an irrigation the water in the soil has reached an equilibrium and has ceased to move in quantities that are of importance to root absorption. This is another reason why vigorous root growth must continue throughout the spring and summer. The common observation that the great bulk of citrus fiber roots are within two feet of the surface and nearly all of them within four feet has an interesting connection with this point that will be discussed later.

In the leaves certain chemical-physical digestive processes take place. The mineral salts contained in the water that the roots absorbed are recovered for tissue building, and large quantities of distilled water are given off into the air by the process known as transpiration. The water thus given off may reach surprisingly large amounts. It is estimated, for instance, that a summer crop of melilotus alba yielding ten tons of green clover per acre will require in the neighborhood of 1,000 tons of water transpired through the leaves. This means about nine acre-inches of irrigation or nine inches of rainfall. Citrus trees belong to the group of plants that transpire large quantities of water continuously. Nearly all plants are equipped with an ability to modify the openings in their leaf surfaces through which this transpiration takes place. This ability varies greatly with different plants. The slight curl of citrus leaves on a hot day is a part of this attempt. The closing of the small breathing pores or stomata is probably more important, although less noticeable. Many plants have certain parts that are used somewhat as storage reservoirs from which reserve moisture can be utilized in times of drouth. Citrus trees apparently have no such special parts, with the result that water that has been passed into the fruit of the tree under certain especially trying condition of the atmosphere is drawn back into the twigs and transpired through the leaves. This phenomenon is said to be one of the contributing causes of "June drop." Increasing the number of newly developed fiber roots must partially offset this tendency through permitting the trees to absorb greater total amounts of soil moisture to be transpired. To the extent that the furrow manure method or surface mulching encourages fiber root growth they should likewise help in the holding of a crop. To the extent that irrigation both ways in an orchard develops fiber root growth in more ground it must be of value in this connection. One must be sure in practice, however, that the irrigation both ways is sufficiently

Duty of Water

From Address by Prof. R. S. Vaile at Citrus Institute, Santa Ana

thorough and sufficiently frequent to be conducive to good root growth, else it would be better to limit the application to one way where favorable moisture conditions might surely be maintained.

I believe that it is very generally understood that the roots of plants cannot take all of the moisture out of soils. Soil that is practically dry, just retaining its granular structure but showing little or no adhesive quality and little or no color due to moisture, will still give off a very perceptible amount of water when subjected to a temperature sufficient to boil water. Soil in the condition mentioned has approximately reached the moisture content known as the hygroscopic coefficient. This point varies in different soil types. Sand will then contain only two or three per cent of its dry weight of water, while very heavy clays may contain as much as 15 to 18 per cent. Most plants, particularly the annuals, will permanently wilt before the soil surrounding their roots becomes as dry as this, although field trials with walnuts indicate that they can utilize the moisture to prevent wilting just about to the h. c. Active growth will have ceased, even with walnuts, some time before this degree of dryness is reached, and the reserve supplies of moisture stored in the plant itself will likely be strongly called upon.

Soils in general will hold under field capacity just about 2.5 times as much water as is represented by the hygroscopic coefficient. In other words, in a sandy soil with a h. c. of four per cent the maximum field capacity two or three days after a rain or an irrigation will be somewhere near ten per cent. Much of the soil in the Anaheim, Covina and Ontario sections would be of this general nature. A clay soil with a h. c. of 12 per cent will have a field capacity of 30 per cent. As a matter of fact, however, it is rather difficult to get the clay soil to this high a point, and there is much field evidence that slightly less moisture is more desirable. The heavier soil on the Leffingwell rancho is typical of this class.

In the irrigation of citrus we should always irrigate before the soil has reached the h. c.; while it still shows considerable color and feels slightly moist to the touch. We should then plan to put on enough water at a time to raise the moisture content of the surface four feet to its field capacity. The use of more than this amount is probably wasteful. With walnuts and probably with beans, deeper penetration is highly desirable, but as already pointed out, nearly all the fiber roots of citrus are in the surface four feet. This is an easier thing to control than might be supposed, for as water moves downward in soil the moisture content is raised to the capacity or above as far as the water penetrates at all. In other words, the point between the wetted and unwetted soil is very distinct rather than a gradual grading one into the other. This fact gives opportunity for a very easy testing of the depth of penetration of irrigation water. A steel rod of 1/2 inch to 5/8 inch diameter, equipped with a T handle, and a convenient length, from

4 1/2 to 6 feet, can be shoved down in the irrigation furrow as far as the water has penetrated, when it will come to an abrupt stop. The best way to operate such a prod is to push it down with short, jerky strokes, for in that way the transition point will be more clearly recognized. Flowing water in the furrow is of great aid as a lubricant. In this way the penetration in many furrows can be accurately tested in a short time. Of course, a plowsole or other obstructing layer may make the soil above it much wetter than the ordinary field capacity for a time, but unless the layer is entirely impervious the downward movement will continue until field capacity equilibrium has been reached, and this will bear approximately the same ratio to the h. c. at the lower depth of penetration as in the upper soil. Where a plowsole does exist so that the entire surface is saturated before the penetration starts on downward the water in the surface soil is almost wholly lost by evaporation. The surface soil that is to be cultivated should be kept as dry as possible during irrigation to avoid this loss.

Water will move more freely in moist soil than in dry soil. You know how hard it is to wet road dust. You also know that the early spring irrigation seems to require more water than the late fall ones. Certain field trials indicate that while an inch of rainfall will only penetrate six inches into the soil that has dried down to the h. c., it will penetrate about a foot into the same soil when it is already half way between the wilting point and field capacity—the condition in which I have suggested that citrus should be irrigated. Toward the end of the irrigation season, therefore, it is frequently desirable to run smaller streams for longer times than in the early spring.

I have already intimated that moisture moves upward through soil to the roots very slowly, if at all. Because this is somewhat contrary to general belief, I reiterate it here. Very elaborate tests have been conducted to show that we certainly cannot expect water over one foot below the roots to come up to the roots in any one year. With our system of fairly frequent irrigation it is doubtful if the trees get any benefit from the water that has passed beyond the root zone. So with citrus irrigation we have the surface four feet to deal with.

May I outline two practical examples from the statements made above. A sandy soil with a h. c. of four per cent should always be kept moist enough so that it will show a moist color and feel slightly moist to the touch. This will mean probably about six per cent of moisture. Its field capacity is ten per cent, so that the margin that is to be supplied by irrigation is only four per cent of the weight of dry soil. This means that the surface four feet of such a soil can only retain about 2 1/3 acre-inches of water at one application. Field determinations made in the Ontario and Covina sections on sandy soils bear this out very closely. For those who are not familiar with the term acre-inch, I may say that it is the equivalent to an inch of rainfall. Two miner's inches running for 24 hours

give an acre inch, or 45 miner's inches for 24 hours distributed over ten acres give 2 1/3 acre inches. In other words, the use of more water than that at one time on a sandy soil is probably wasteful practice for the irrigation of citrus trees. It is probable that the small margin between field capacity and the danger point for drouth will require rather frequent applications of this small amount, possibly every three weeks, for the transpiration rate for citrus is high and the amount of usable water is low. Two and one-third inches will be partially wasted by deep penetration if it is all applied in the strip between the trees one way, rather than through all the soil. This, of course, is assuming a good irrigation, with little or no run off and without complete saturation of the surface soil.

In the case of a clay soil, with a h. c. of 12 per cent we have a much wider margin between the drouth danger point and the practical field capacity. It is probable that as much as six acre inches can be retained in the surface four feet of such a soil, i. e., a 60 miner's inch flow for 48 hours on ten acres. This larger amount of water which may be stored in the surface four feet of soil will permit of longer intervals between irrigation than on the sandy soil up to six weeks or even 60 days. This is generally borne out in practice. Sometimes, however, the root systems are not so well distributed on the heavy soils as on the lighter ones. This is especially noticeable in the adobes of Tulare County, where a three or four week interval sometimes seems necessary. In such cases the application should be governed so as not to wet the soil over two or three feet, as the root development might dictate.

The old economic law of "diminishing returns" applies to the use of irrigation water just as clearly as to the use of any other goods. As Mr. Jones has said, the annual yield of alfalfa in the Sacramento Valley was increased less than three-fourths tons per acre when the irrigation application was increased from 30 to 60 acre inches. Not only was the return in crop yield from the additional water entirely insufficient, but doubtless a continuous application of this sort would prove injurious to lower lands through seepage, to say nothing of the injury to the other man whose well is unnecessarily lowered through too heavy demands.

With citrus, then, the problem is to constantly prevent the soil which comprises the root zone from losing its moisture to such an extent that the moist feel and color begin to disappear; to wet the soil to field capacity only to the limits of the root zone, and to do this just as often as transpiration through the leaves uses up the supply of water that can be stored in the soil area.

Just about the only excuse for heavier irrigation for citrus than that outlined above is to be found in connection with the alkali problem. Where excessive alkali salts occur either in the soil itself or in the irrigation water the soil solution should be kept as dilute as possible through the use of fairly liberal quantities of water at frequent intervals. Then, too, where there is an open subsoil it is often possible to wash the injurious accumulations down below the root zone by using very copious amounts of water occasionally. This method should not be resorted to unless actually required, for it might often be employed at the expense of injuring

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

SKIN GAME

Shoes and other finished leather products are still beyond all reason in price. Cattle are down and hides are being "hoarded" by cattlemen who are unable to sell them, sometimes at any price whatever, and in any case not at a price which will pay for the labor of skinning. Yet the cattlemen continue to be profiteers. Yes!

ABOUT FIRES AGAIN

A scanning of the local country papers of California shows too often headlines like these: "Two Hundred Acres Grain Burned"; "Fires Sweeping Through Timberlands North of Shasta"; "Brush on Watersheds in Angelus Forest Burning"; and others which convey to irrigator and to producer a lesson of loss from uncontrolled fires. Repeat the slogan often, "Help prevent fires."

MORE BRIDES

A Japanese steamer landed in San Francisco last week, a Japanese steamer under a Japanese flag, and bringing to the United States 40 picture brides.

And some Americans maintain that such incidents should lead to closer relations between this country and

Japan! The short distance which some people can see into the future leads us to express ourselves editorially thusly:

Oh gosh!!

A NOTHER BOOST FOR H. C. L.

The federal government through its railroad labor board has given a lusty boost to old High Cost. Railway workers are to receive an increase of approximately 21 per cent. This will add between 600 and 700 millions to the compensation of the workers. Chiefs of the railways are now in session, devising ways of meeting this enormous increase. How much passenger rates will be raised is not yet announced, but the freight increase will be at least 18 per cent, and very probably 20 per cent, greater than prevailing at present. The increase to individual workers will be from 80 cents to \$1.04 per day.

CLEAN EGGS

The Poultry Producers of Southern California issues a live wire circular to members, usually made up of newsy items and especially of statement of market and financial conditions. Here is one from the last circular:

"Remember that dirty eggs cannot be advantageously handled at this season of the year. It is to your interest, as well as to the interest of every other member, to clean all eggs before packing for shipment to the association."

Of course a dirty egg contains just exactly as much nourishment as does the purest and whitest. It is possibly true that even the flavor is not affected. But notwithstanding these and similar suggestions which may come from the producers of dirties, they won't go in the market. There is only one way to produce what the market wants and that is to produce what the market wants.

PERMANENCY

D. B. Macoun, superintendent of the Mills Orchards near Maxwell, Colusa County, gave us a text for an editorial the other day. The text consisted of one word, "Permanency." Mr. Macoun says that word expresses more as to agriculture than any other which may be used. We are not here to mine and exhaust the riches of the soil; we are here to perpetuate and make it more productive for the next generation than it is for our own. Unfortunately, such preachment may be ill received by some who show by their practice that they do not believe such doctrine. But the welfare of the human race calls for greater consideration of this topic, and, most fortunately, our best farmers are appreciative of the great truth expressed by that word.

The orchardist is asking: "How may I grow a tree which will produce more at 20, 30, or even 40 years than it does at ten?" The nurseryman answers: "Secure a tree which has longest lived and most vigorous rootstock for foundation and on which is grafted scion from vigorous tree of known producing type."

The grower of crops asks: "How may I handle my soil so that records which have been made by producers of this country during the last two score of years may be reversed, that is, how may crop yield increase from year to year, instead of following the usual rule and showing annual decrease?" The soil experts give answers which are wonderfully diverse,

but, in a word: "Maintain and increase humus, or vegetable mold, content and restore the elements which have been removed."

But the questions which arise may not all be answered excepting through ages of time and by innumerable crop producers.

Meantime let the producers' hanner be inscribed, "Permanency."

REAL PROBLEMS

In this day when the average city newspaper editor feels that he is displaying good "newspaper sense" by taking a fling at the farmer producers and charging them, in boldface type, with being at the root of the H. C. L., simply because he thinks that city readers like that sort of "bunk," it is refreshing to find an occasional city paper that makes use of its editorial columns to comment in a sane way on pressing agricultural problems. Such a paper is the Sacramento Bee. During the past two weeks several editorials have appeared in that very excellent paper that indicate that the editor has not permitted politics and the general run of news to break his contact with agricultural affairs. So far as we have observed, the Bee is the only metropolitan paper in California that has commented on the sensational exploit of California Holsteins at St. Paul. It is likewise the only paper that has pointed out that while the price of hogs is at a point where many producers are being forced out of the business, the retail price of pork has not shown any appreciable decline. More recently a half column was devoted to the proposed pure fabric law.

If more city papers displayed the same broad concern on vital agricultural problems a deal of misinformation now reaching the public through twisted stories written by small hore reporters would be counteracted and all interests would be better served. The day of the city editor who regards the farmers of this country as fair game at which to take a "crack" is about over. Restricted production can, to a large extent, be charged to the short sighted policy affected by many city newspapers.

LET'S COOPERATE

The California Cultivator fully believes in the shoemaker sticking to his last and allowing the butcher, the baker and the candlestick maker each to have a chance to make a living and to make for us our candlesticks and other things which may be necessary for us in conducting farming operations. Presumably they can make them better and cheaper than can we whose training has been entirely to a different purpose. But if the profits demanded by manufacturers and middlemen become so excessive that we cannot continue to purchase needed supplies, there is some way of securing relief. If we must continue to pay 25 or 30 cents a pound for sugar, \$100 for a suit of clothing, the wool in which netted to the producer only \$5 or \$6, and \$10 or more for a pair of shoes when hides remain a drug on the cattleman's hands or sell at a price so low that he cannot hire the animals skinned and secure his expense back, something has got to be done.

There is faint indication of a little relief. A financial review, issued by large commercial institution, reports "reductions in cost of textiles and huge cancellations received in the furniture business and other indica-

tions of falling prices." But these "favorable" indications are more than offset by nearly a billion just added to the wage scale of railway employees and a probable 20 per cent boost in all transportation charges.

Perhaps the beet grower cannot build a sugar factory nor the wool grower woolen mills, but the only salvation for the producer these days is a fairly close understanding, or gentlemen's agreement, between himself and his neighbor. Or another suggestion comes as we look back in memory to scenes in the homes where mothers used the spinning wheel and the loom to increase the comforts and even the luxuries of the family. The suggestion may cause a spinning wheel or loom trust to boost prices!

MORE GAS

The gas line at the filling stations is still lengthening and we, the dear public, the gas users, are slowly arriving at the conclusion that there must be either more gas or fewer gas consumers. No other word expresses the situation created by the increase in automobiles, trucks, tractors and other power better than "astounding." This is not to be used as an apology for a gas trust, or other than a mere statement of fact. But the American people may well open their eyes and think a hit on this problem which must be solved. If more of mineral oil can be produced, so much the better. If not, then other sources of power must be, for it is unthinkable that the world could now move along without automotive vehicles and power.

Some years ago congress made provision for the manufacture and denaturing of alcohol, and an enthusiastic believer in the virtue of the enactment wrote: "When congress provided for the denaturing of alcohol after January 1907 it did for the agricultural industry more than it has been able to do for any other. It made possible thereby the new use of its products and in vast quantities for the manufacture of a fuel and gave the farmer a chance to compete with the coal and oil industries as a producer of a fuel to drive his own machinery as well as that of other industries."

That was some 13 or 14 years ago, and the act from which so much was hoped has proven another failure. Perhaps this was because of the alleged jokers in the amendments. Again, it is possible that if it had not been for these amendments which it was charged at that time, were secured by interested influences, the use of this form of power might have been held back by inherent weaknesses in manufacturing methods which scientific investigation would have been called upon to correct. But if that were the case 14 years ago, a situation now confronts us which calls for the best thought of our brainiest investigators.

The Standard Oil Company has issued a statement from a California standpoint, and an outline of the statement is:

"Crude Oil Supply: California will this year produce about 100,000,000 barrels of crude oil.

"Crude Oil Consumption: The Pacific Coast will this year consume about 110,000,000 barrels of crude oil, the 10,000,000 barrel difference being drawn from reserve stocks.

"Gasoline Supply: Greatest in history of California oil industry and augmented by the importation of millions of gallons from Eastern and Mexican fields.

"Gasoline Consumption: In 1915 there were 239,000 motor vehicles on the Pacific Coast, in 1920 more than 780,000; in 1915 there were 3,000 tractors, in 1920 at least 25,000. There are many thousands of gas engines in operation. In 1918 the Standard Oil Company's sales of gasoline amounted to 152,000,000 gallons. In 1919, 193,000,000, while the sales of 1920 will be more than 300,000,000 gallons. So far this year this company has sold 48.4 per cent more gasoline than for the same period of last year."

Now the question is squarely up to the users of power, and the greatest of these is the farmer.

Increasing the State's Wealth

By C. B. Messenger

It has been remarked that it is a wonder that with the slipshod methods often followed in farm operations the measure of success secured by farmers is as great as it is. The rule of thumb or "doing as Dad did," was formerly, at least, quite sufficient. Today we are learning, and learning very rapidly, and we find there are better ways of doing things than those of yesterday.

We have often felt that orchardists were rather in advance of the general farmer. However, a look at the orchards of California, the greatest fruit state, and we find conditions which compel us to stop and ask: "Really,

work is progressing nicely, although we have had some minor difficulties. It has been necessary that we enlist the aid of fruit authorities on different standard varieties of California fruits in order to get the best action this first summer. We find that horticultural commissioners and members of different fruit associations are very willing to help us in every way possible."

CALIFORNIA CITRUS INSTITUTE

We have approximately 200,000 acres planted to citrus in California and produce annually a crop valued at about \$75,000,000. Yet until very

One of the Best of Its Kind

Photo of Santa Rosa plum in Madera County orchard. This particular tree was discovered by Commissioner Marchbank.

are the fruit growers so far in advance?" But there are orchards that are outstanding. Thrifty appearance gives indication of power of producing more wealth, and we say: "Why the difference?" The methods of culture are but little different from those of neighboring orchards, but that "little" expresses much. One of the items of this slight difference in the handling of the productive orchard may be in the selection of tree or selection of nursery to supply that tree.

Formerly, the principal nurseryman was the "tree agent," representing sometimes an unknown or far away nursery. Fortunately, he has never been received here with open arms, as in many Eastern sections. Established nurserymen have been in better form, and these established nurserymen, aware of this fact and the further fact that they are looked to as security in the building up of new orchards, have adopted methods of work in California far in advance of those followed in any other section. Hence the reputation of our nurseries.

Now they have gone a step farther and every nurseryman has insisted on more careful selection of buds and root stocks. An indication of this careful work we give on cover page this week in the picture of one particular tree that may mean much to the history of California horticulture. Regarding this tree, William T. Kirkman, president of the Nurserymen's Bud Selection Association, writes:

"Apricot tree under investigation by Nurseryman's Bud Selection Association of California. The best actual bearing record turned in by a grower of apricots this season is on an individual Tilton in F. E. Mannel's six year old orchard at Shafter, Kern County. This tree bore 591 pounds of fruit. It is the aim of the Bud Selection Association to secure records year after year and propagate only from trees that are proving to be consistent bearers of superior quality fruit.

"The other photograph shows a limb from a Santa Rosa plum tree which has been selected with the aid of George Marchbank, horticultural commissioner of Madera County. This is apparently the best tree in a good Santa Rosa orchard. There are practically no plums on the tree that would not go into a three-four or four-four pack.

"We are endeavoring to get all of the nurserymen of California into the Bud Association, as you know. The

recently we have had no general citrus association at which growers meet to discuss their cultural problems and learn advanced ideas from each other.

To meet the need of this great industry the citrus growers answered a call issued by the management of the National Orange Show and met at San Bernardino last February. There had been several of these informal meetings held under direction of J. W. Jeffrey and Dr. A. J. Cook when they were at the head of the state horticultural commission; others under direction of the citrus experiment station at Riverside. The one held last February under direction of Dr. Webber of the state experiment station afforded opportunity to discuss the need of making permanent this institute. The suggestions immediately took definite form in organization and adoption of by-laws, providing that there should be held two institutes each year; the one in the summer to be movable, held from place to place, the other to be held in San Bernardino during the time of the National Orange Show.

The declared purpose of this institute is to advance the scientific and practical knowledge of the industry through the holding of public meetings, publication of reports and such other means as may be deemed advisable. Any person interested in these purposes may be elected to membership by a vote of the directors and by paying the annual dues of \$2 per year. R. S. Valle of the Riverside experiment station is secretary of the institute.

FOREIGN OLIVE CROP

Consular reports from abroad show the olive trees in flower at present. In Italy rain is much needed, but orchard conditions are better than at same date last year. In Africa the report from Algeria is "very good," but in Algeria, while flowering took place under good conditions, some difficulties are being experienced with insect pests.

PEACH GROWERS NAME PRICES SOON

Sales Manager Sturtevant Jr. of the California Peach Growers writes: "Stocks of 1919 crop dried peaches on the Coast are now exhausted. We have no prices at this time. We do not expect to name prices on the new crop for a few weeks yet. It now appears that the new crop of dried peaches will be about the same in tonnage and quality as last year."

DE LAVAL IRRIGATION PUMPS

High Efficiency Saves Power

Above are pictured the DeLaval Labyrinth Protecting Rings. The pump case ring on left, impeller ring on right.

These rings are so constructed as to eliminate all leakage and yet provide the greatest possible clearance. They are made of bronze and to standard gauges, and can be replaced without fitting. They mark the highest point of efficiency.

This is one of a series of advertisements explaining the different parts of the De Laval Irrigation Pump. Write us and learn what can be saved with High Efficiency Pumps.

A Portable Power Plant

The Fuller and Johnson Farm Pump Engine is an independent power plant that can be used for many purposes besides pumping. It will run separator, churn, fanning mill, corn sheller, feed grinder, washing machine, sprayer, or other light machinery. Can be attached to any pump without extra fittings. Delivers 270 to 2500 gallons of water per hour. Simple and economical to operate. Ask for catalog.

Buy a Kerosene Engine!

The rising cost of gasoline makes no difference to the owners of Fuller & Johnson Stationary Kerosene Engines. We can supply these engines in all sizes—3 H.P. to 25 H.P. Model "H" gasoline engines from 1½ H.P. to 5 H.P.

Almond Huller, \$415.00

Manufactured and Patented by
L. K. VAUGHAN, 172 Elm St., Woodland, Cal.

Some Smiles For The Farmer

Have you seen the Almond Huller that don't wear out the fingers and you don't have to stand at the stacker and see the meats going into the hulls as loss? With this machine you can hull or crack all the nuts and no waste at all and have time to go to all the fairs and no worry. Write for any information. 1-3 tons in 10 hours guaranteed.

PACIFIC NEW AND RENEWED PIPE SAVES MONEY
Renewed screw casing costs from one-half to two-thirds less than standard pipe. Large savings on standard pipe, fittings and valves, special fittings made to order. Pacific Pipe is thoroughly tested and guaranteed for 150 pounds working pressure; asphaltum dipped; serves every purpose. Let us save you money. Write

Promise of Good Apricot Prices

Apricot growers who are members of the California Prune and Apricot Growers, which claims to market 75 per cent of the prunes and apricots produced in California, will be paid from 18 cents to 33 cents a pound for their 1920 crop of dried apricots, according to prices named today by the board of directors of the association.

Prices to be paid the growers are, according to quality and size, Sun-sweet quality: Extra Fancy Moor-parks, 33 cents a pound; Fancy Moor-parks, 30 cents. Sun-sweet quality, all varieties: Extra Fancy, 30 cents; Fancy, 28 cents; Extra Choice, 26 cents; Choice, 24 cents. Growers' quality: Fancy, 26½ cents; Extra Choice, 24½ cents; Choice, 22½ cents; Slabs, 20 cents; Standards, 18 cents.

Though the tremendous export demand, which so strongly influenced last year's high prices, has completely collapsed, according to H. G. Coykendall, general manager of the association, the association has been able to name a slightly higher average

price for this year's dried apricots than last year.

In announcing the prices to be paid the growers, Mr. Coykendall said: "The growers are very fortunate in being able to sell their 1920 crop of dried apricots for an average price slightly higher than the one they received last year. It is entirely due to the association that a market has been developed capable of taking care of this year's crop of dried apricots at the prices named today. By good salesmanship and advertising, the association has built up a domestic market which will make up in great part for the almost entire failure of the export trade, upon which last year's prices were based."

"If anybody thinks that the association, through its 10,000 grower members, is not responsible for the market conditions which made possible today's prices, let him ask this one question, 'What price would the packers pay the growers for their dried apricots today, in the face of a dull market and no association?' The price would be so low as to be ridiculous."

Peach Popular

THE volume of peaches shipped to market surpasses that of grapes, cantaloupes, strawberries, pears, grapefruit and plums, and is exceeded only by that of apples, oranges and watermelons, according to figures compiled by the bureau of markets. Among the ten leading domestic products classed commercially as fruits, irrespective of length of season, therefore, the peach ranks fourth in average number of cars shipped yearly. The four year average number of cars of each of the leading fruits shipped annually is: Apples, 37,375; oranges, 35,000; watermelons, 28,600; peaches, 25,384; grapes, 22,300; cantaloupes, 17,500; strawberries, 11,950; pears, 10,070; grapefruit, 6,800; plums and prunes, 2,980.

The four year average of about 25,000 cars of peaches may be compared with an average of about 35,000 cars of oranges, 29,000 of watermelons, 20,000 of grapes, 18,000 of cantaloupes, 12,000 of strawberries, 10,000 of pears, 6,800 of grapefruit and 3,000 of plums.

Production Irregular

Owing to the uneven yield it is not easy to say whether production is increasing or decreasing. The total crop estimate for 1918, including both the commercial and general crop, was about half the average of the two preceding seasons, while in 1919 the estimate was two and one-half times that of the preceding year and larger than that of any year from 1916 to 1920. Some Northern states, particularly New York, suffered heavy losses from winter killing of trees during the past two or three years. New York led the states in peach production before 1917 and in that year shipped more than 7,000 cars, or one-fourth the total out-movement of peaches that year, but dropped to 1,057 cars the next year and shipped 1,434 in 1919. The official forecast shows a moderate increase in the New York crop this season.

During the past few years Georgia and California have kept far in the lead as peach shipping states, with combined volume equal to that of all other states. Formerly about nine-tenths of the great California peach crop was used for drying or canning. The increasing demand for market fruit brought out nearly 8,000 cars from California last year, or a little more than the Georgia shipments for the same season.

The general trend of shipping volume for the past four seasons has been downward in the East and North and upward in the South and Southwest. The Rocky Mountain section apparently is holding its own, with gains in Utah, but this season the crop in the whole Northwest is expected to be light on account of injury from cold weather.

The original commercial peach country, including Maryland, Delaware, New Jersey and adjoining sections, shows no decided trend in production, but the section is now of relatively

less importance in the market. The general crop forecast for the present season shows a decrease of about ten per cent for the whole country, with losses chiefly in the Southwest and gains in the North and Middle West.

Season Two Weeks Late

Beside the two great shipping states of Georgia and California, the other early peach shipping states are light in volume of movement this season, and time of beginning shipment is one to two weeks later than last year.

Texas, which shipped nearly 2,000 cars last year, has shipped none in car lots as yet and probably will have but few to spare on account of a peach shortage, amounting to a crop failure in parts of the state. Independent estimates made locally place the Texas crop at only two per cent of last year's, which would mean that very few cars will be shipped out of the state.

The movement just beginning from California is so far about equal to that of the early part of last season. The crop in that state was reduced considerably because of unfavorable weather but still compares favorably in size with previous crops, except that of last year.

The latest available estimate of the South Georgia crop shows probable movement about equal to that of last year. The present indicated yield is somewhat less than last year and less than early estimates of this season, but shipments last year were cut down before the end of the season because of rainy weather, damaged condition of the crop and shortage of ice for refrigeration. Many of the Elbertas had to be sent to local canners.

Early varieties of Georgia peaches have sold this season at 25 to 75 cents per carrier higher than a year ago and still farther in advance of early average prices of the preceding seasons. The Carman, a leading mid-season kind, particularly in northern markets, sold near the end of June, or two weeks later than last season's market opening for this variety, at \$3 to \$4 per six-basket carrier, compared with \$1.75 to \$2.75 a year ago, when the market was unsettled by offerings of much stock of poor keeping quality.

California early kinds, like Alexander and Triumph, have appeared in a few Western markets. Triumphs sold in Chicago July 1 at \$2 to \$2.25 per box. Last season, from June 17 to June 30, the range of early California varieties at auction in Chicago, Kansas City and Minneapolis was 80 cents to \$1.95.

A few Texas Early Wheelers were sold in June at \$4.50 to \$5.00 per six basket carrier, compared with early quotations of \$2 to \$3 a year ago. The local supply is light in the South Central markets usually held by these peaches, owing to peach crop failures in various adjoining states.

Consideration of price ranges in the various cities quoted in the paragraph above suggests that high averages of price are common in large

mental plants, and on the methods of their control, and by furthering co-operation between the scientific investigators and the manufacturers of chemicals and appliances, especially for the sake of effecting standardization and economy in the production and use of the means of fighting pests. Also, it expects to aid in the dissemination of scientifically correct information regarding the control of injurious insects and plant diseases.

BORDEAUX MIXTURE BENEFITS CITRUS BLAST

Of the ten or 12 sprays used in the Butte County farm bureau citrus blast control experiments in demonstration orchards, Bordeaux mixture has given the most beneficial results as reported by the farm adviser.

Not only has Bordeaux mixture helped in the control of the citrus blast, but it has helped to the extent of being almost a cure, and this is most gratifying to citrus growers in this county and all over the state.

This bacterial disease is widespread in Northern California, but it is not yet found in Southern California. No control measures were known and this is the first time any methods of controlling the disease have been tried out.

Dr. H. S. Fawcett, who is in charge of the experiment work, gave a report of his findings on the sprayed plots in the McCune orchard. Those trees which were sprayed all had less than five dead leaves per tree, while the check trees which were sprayed had from 20 to 40 dead leaves per tree. The spraying was done in the fall, during the early part of December.

Although one year's experiment will not give conclusive evidence, nevertheless, the indications are very hopeful, and with one more year of work very reliable information should be secured in reference to the control of this blast.

The following farmers have had citrus blast demonstration in their orchards and have given liberally of their time in helping with this experiment: Fred Cornehl, Joe Black, R. P. McCune of Wyandotte, Geo. Gates, and Dr. Middlehoff of Thermalito.

ERADICATION OF CITRUS WHITE-FLY AT BAKERSFIELD

For a number of years one of the citrus feeding species of whiteflies has existed on the Stockdale Ranch near Bakersfield. An attempt was made by the old state horticultural commission to eradicate the pest on this ranch, but without success. Viewing the occurrence of this insect at Bakersfield as a menace to the citrus industry in Southern California another attempt at eradication has just been completed through the cooperation of the county horticultural commissioner of Kern County and the office of pest control. Mr. Knowlton, the local commissioner, and Mr. Brannigan of the office of pest control have given the work their personal supervision and it has been painstakingly carried on. Approximately \$750 was spent by the county and the Stockdale Ranch. It is hoped that this will mark the end of the infestation, but the work will be followed up with frequent careful inspections.—Harry S. Smith, in charge of Office of Pest Control.

LANT PROTECTION INSTITUTE

At a recent meeting of the Arizona state horticultural commission, E. W. Hudson was elected chairman. Mr. Hudson has been a member of the commission for the past year and a half. He succeeded Hon. Andrew Kimball as chairman, who still retains a place on the commission as a member. Don C. Mote has been re-appointed state entomologist. W. H. Robinson was reelected secretary of the commission. Dr. Oscar C. Bartlett was reelected field entomologist and D. C. George succeeds himself as plant entomologist. Three new assistant entomologists were added to the staff. These are: R. J. Fiske, with headquarters at Stafford; Frank E. Todd, with headquarters at Yuma, and E. E. Russell, for the Santa Cruz Valley and Mexican border.

Everlasting drainage is a certainty with *Vitrified Salt Glazed Clay Drain Tile*; it never need be relaid. Acids and alkalis from fertilizers, water from salt marshes, or soil acids created by decaying vegetation, cannot soften or crumble it, cannot ever weaken and cave in its walls to clog the flow. *Vitrified Clay* is insoluble.

"Vitrified" means that its walls have been solidly melted together in fierce heat to make them hard and dense as a stone jug instead of soft and porous like a flower pot. This density prevents much damage by freezing and thawing. Air and water pass through the joint.

Increased crops pay for it in two or three years. And the tiled acres steadily grow in value as the soil becomes looser and more friable from unfailing drainage.

Lay to stay with Vitrified Clay. Sold by dealers everywhere. Booklet mailed on request.

Fumigation of Citrus Trees

IS IT possible to fill the bugs which infest citrus trees so full of prussic acid gas that they learn to like it and thrive upon it? In other words: "Are black and other scale pests of citrus trees becoming immune to the ordinary fumigation dosage?"

Years ago "Only black scale. Easily controlled" were common remarks. Today "The black scale is our worst citrus pest" is heard wherever citrus growers meet.

Last week they—300 of them—met at Covina because of call of Horticultural Commissioner Ryan and discussed fumigation.

R. S. Woglum of the United States bureau of entomology was the chief speaker. He presented data compiled from experiments and field observations made during the past season and mentioned various factors influencing the kill of black scale, such as off-hatch, temperature conditions, heavy cover crops, resistant scale, insufficient dosage, poor equipment and careless work.

He stated that the presence of heavy cover crops at the time of fumigation militates against efficient work by preventing the skirt of the tent from setting close to the ground and because the liquid gas, which reaches an extremely low temperature when leaving the pump nozzle, freezes on the cover crop and vaporizes too slowly to keep up with the tent leakage, thus preventing a high enough concentration to kill the scale.

"Liquid hydrocyanic acid is not a failure," said Mr. Woglum. "Some districts have had as good work done this past year with liquid gas as ever before in their history. In our own experience during the past three years we have in every case observed at warm temperatures exactly as good results with the liquid gas as with the pots. Series of trees side by side have been fumigated at normal temperatures under both systems, and in such cases if either way was to be favored, it was the liquid gas."

The following specific recommendations for fumigation procedure in the Covina and Charter Oak districts were made by Mr. Woglum:

Trees should be taped, not guessed; and dosed according to schedule.

Black scale should be in the immature condition when fumigated.

Use heavy dosages. Certainly not less than 88 per cent schedule; a 100 per cent as soon as the trees will stand this strength.

Fumigate as early in the season as the scale is in condition.

Where "off-hatch" is present, double fumigation is advocated. The first treatment should be early in the season. The second probably two to three months later, or as soon as eggs are all hatched.

Avoid having a heavy cover crop about trees while being fumigated.

Avoid winter fumigation, particularly at cold temperatures, if possible. Where winter treatment is necessary, practice daylight work.

Caution operator to prevent nozzle of pump coming close to tree trunk.

Results at temperatures below 500 degrees Fahrenheit average poorer than at higher temperatures.

Fruit injury increases with high dosage. A slight loss from pits is less expensive than a heavy loss from scale infested trees.

Do not fumigate trees that have been sprayed with Bordeaux mixture within a year; painting high upon the trunks and branches is also conducive to injury from fumigation with hydrocyanic acid gas.

Each grower to keep records of individual tree dosage; also of temperature.

Commissioner Ryan called attention to the abundance of scale at the present time due to favorable climatic conditions and presented figures compiled from reports of district horticultural inspectors, showing that 27,000 acres of citrus trees were fumigated in Los Angeles County last season for black scale, at an estimated cost of \$850,000, and that 2,000 acres were sprayed at an estimated cost of \$50,000.

Of 548 fumigated groves reported on to date, in approximately 60 per cent good to excellent results were obtained. Of 147 sprayed groves, good results were secured in 20 per cent.

J. R. LaFollette, foreman of pest control of Leffingwell Ranch, gave account of his three years' work on that ranch. This address will be given almost entire in a later Cultivator.

The effect of arsenical sprays on the flavor of oranges was discussed by Professor George P. Gray, chief chemist of the California state department of agriculture, who gave the results of investigations recently carried on here by his office in cooperation with the Fruit Grower's Supply Company and the office of the county horticultural commissioner.

He stated that the surprising fact has been established that the use of two well known proprietary sprays, sometimes applied to citrus trees in the effort to control black scale, results in a material reduction in the acid content of the oranges and affects the flavor to such an extent that the fruit is rendered flat and insipid.

The spray materials in question are composed of lead arsenate, soap powder and sulphur. In reply to a query put by one of the growers, Professor Gray stated his opinion that the arsenic in the spray was the cause of the loss in flavor.

Concerning Our College of Agriculture

MR. ROYCE'S article which was given in the California Cultivator of June 5, together with a letter by Mr.

Wing, has caused no little comment and has brought to the office heartiest of support for the college of agriculture and for the university; at the same time other comment which contains suggestions which may be of interest and of profit to Cultivator readers.

One communication we will not give. This has to do with a condition claimed to exist as to lack of incentive to the highest and best in spiritual or at least moral life. This condition, however, is not peculiar to California, as may have been noted by many of our readers, especially those who noticed a recent issue of the Literary Digest which quoted from addresses made to students by President Richmond of Union College, Chancellor Day of Syracuse, Dean Jones of Yale and President Hibben of Princeton. Strange as it may seem, these educators, in making the addresses to their classes and appealing for the proper attitude toward life's problems, charge to the late war responsibility for lowering our moral ideals.

Dr. Hibben

Today I have particularly in mind the danger of a loss to you of something of incalculable value. It is not the danger of missing something which you have never experienced, but of losing that which you have already possessed, that possession you shared in common with us all during the years of 1917 and 1918. There came to you then a peculiar elevation of spirit, when the world suddenly awakened to a realization that there was a cause to defend, challenging one's loyalty and commanding one's devotion, and that there was something to believe in, something to fight for, and something even to die for. There was no one of us who failed to experience this moral and spiritual exhilaration. In those days we lived on the high places of the earth and saw the vision and dreamed the dream of a new order of things in the world. The words "duty, sacrifice, service," were often on our lips and constantly in our thoughts. More than that, they were actually illustrated in the lives of most of the men now before me. The cause itself has been vindicated by arms, but its ideals have not been realized as yet in the days of peace. Too soon we

are tempted to forget past allegiance and loyalty.

President Richmond

There is evidence enough to show that for the moment at least we have reacted to a lower level. The magnificent spirit called out by the demands for sacrifice and heroism has flattened out into a passion for self indulgence and a mean competition of greed. It is a passing phase. We have too much faith in human nature to believe that we shall not recover. But we must not blind ourselves to the fact that the world over the mass of men and women are in the mood to barter their spiritual inheritance for a mess of pottage.

Dr. Day

When the average workingman can earn the living of seven days in two, it is a great temptation to loaf four days. It is not the rich oppressing the poor. It is the poor oppressing both the poor and the rich. It is getting money on false pretenses.

I would move an amendment on the profiteer price law: Fine the man who pays three times more than he can afford to pay. And if you are going to fine the traders for charging too much, fine the mechanic and workingman for exacting three times what their labor is worth simply because they can get it.

Dean Jones

It is astonishing how much faith many parents have that Divine Providence will bring up their children. They are becoming more and more indulgent. There is no longer insistence on the sacredness of the moral code. When something is twisted in a boy's life, if he gives you his full confidence, you may be practically sure that his trouble can be traced to some peculiarity, neglect, or blindness in his home training. Unfortunately, the training of parents is not always negative; the blind imparting of worldly ambitions is too characteristic of the American family.

Dean Jones places the responsibility and failure directly up to the parents, and there it belongs. There should be more oversight of our young. However, this does not entirely release our colleges from the duty before them. We will not touch this phase of the subject further but will give some of the comment brought out by Mr. Royce's former article.

R. R. Lockhart

Like a great many other alumni, I read the article "Concerning Our College of Agriculture" in the Cultivator with a keen sense of pleasure and with a feeling that at last someone had come to the front to initiate an active inquiry into ways and means for the development of a more efficient college of agriculture.

Not infrequently, when two or more of us, who have long since worn out the last remnants of our college corduroys and senior sombreros, come together; after we have found out what "Ed" is doing now, and where "Bill" is located, etc., the question arises, "Well, after all, what do you think now of the college of agriculture?" We remember the farm and what fine fellows and wonderful instructors "Tommy," "Daddy" True, Sam Beckett and others were. We still think them that, and in addition have added, due to some severe knocks in the school of experience, a larger respect and appreciation for what they taught us. We know now the handicaps of equipment and organization against which they contended and how they made up for it by greater personal effort and sacrifices. But the trouble was, especially in animal husbandry and in agronomy, that we didn't get enough of it. True, we spent four long years in college, but for the first two and one-half years we were taught farming on the campus at Berkeley, a place wonderful for that which it is intended, yet a place artificial in substance and life, and which is far removed from the atmosphere and the life in which farmers are wont to grow thrifty and prosperous. We plodded along through the fundamental sciences underlying the broader agricultural fields, yet failing in a large measure to appreciate the application of these to the practical. Don't mis understand me. I do not contend that students should not go to a place designed and adapted for study, nor that they should not study the fundamental sciences. But it does seem to

me that the present plan should be revised. Why not take prospective farmers early in their college courses to Davis, there let them see, let them discover for themselves what farming is, what livestock looks like in actual life, how plants actually grow and are cared for? Let them see why it is necessary to dig down to the underlying causes of why things have to have certain attention from their germination or inception on through their natural life to a successful fruition. Having then an intimate, even though superficial, idea of the actual animal or plant, by the developing of which at some future time they expect to make a living, let them go to Berkeley where lecture rooms and laboratories are provided and let them there dig out the scientific side of their particular specialty. But, above all, keep an intimate association between the practical money making and money losing farming and the theoretical side. Don't fill the student with theories innumerable and let him find their practical application by the sad knock of experience and by financial losses, resulting in discouragement and disgust with his life profession, rather point out to him in the field as he progresses the relation of theory to actual practice.

There is another side to the question. No one denies the value of the associations at Berkeley. Many value them more highly than their actual studies, and rightly so. For this reason, for administrative reasons, and for the reason that there are so many divisions and parts of divisions of the more scientific side of agriculture that can more easily be taught at Berkeley than at Davis, I do not see wisdom in the suggestion of moving the headquarters from Berkeley. Why not leave it headquartered where it is now with its connections and associations with the university as a whole, but have various branches of it located with reference to the type of farming in various parts of the state? Then let the student who is to major in animal husbandry go to Davis early in his college career and get that intimate touch and association that will make him a judge of livestock to compete with any. If there are certain things that he can be taught better at Berkeley, let him spend at least one year there. In a similar way let the citriculture student spend not over three years of his course at Riverside, the pomology student at Davis or San Jose, and so on. One can see eventually a branch in the north Coast counties where dairy problems of that section can be better worked out and taught than elsewhere.

The university and the college of agriculture are now overflowing their accommodations. Why not eventually have a branch in the central Sacramento Valley (Davis), the central San Joaquin Valley (Fresno), one in the South at Riverside and so on, where students of each locality can get in intimate touch with the problems of that locality as part of their college course?

The state must realize that its strength lies in its agricultural population. It will eventually take care of them and in the locality best suited to teach them that which will be of most value to them.

Let the college of agriculture be headquartered at Berkeley but do not have it limited to the bounds of Berkeley. Let it spread to the various agricultural community centers, yet let it still remain a part of the larger university.

Louis G. Sutton

I am very much interested in the suggestion to move the entire agricultural college to Davis. I believe that an agricultural college student should have an opportunity to be in close touch with the farm during his entire course. Your enterprise in bringing this matter to the attention of the state is commendable.

W. S. Guilford

I have read with a great deal of interest your article in the June 5 issue by R. P. Royce entitled "Our College of Agriculture."

There seem to be a great many reasons for moving the entire college of agriculture to Davis. The most important thing a boy can get from an agricultural college course is the actual contact with the college farm and with the men who have working

charge of the various departments. As I look back at my work in the Wisconsin college of agriculture, I am satisfied that I received far more benefit from Frank Kleinheinz, the shepherd; George Little, the hog man; Jimmie Hutton, the horseman; George Hutton, the farm superintendent, and Arthur Banks, the dairy herdsman, than I did from Professors Henry, Russell, Babcock and a lot more of the heads of departments in the institution.

I do not believe it is possible to maintain an entirely successful college of agriculture, except on a farm, and if it is to be moved, the quicker it is moved the better.

Roy E. Campbell

I have been much interested in the discussions of the college of agriculture of the University of California in your recent issues, especially that of June 5. As the writer is a graduate of several years standing, he feels that he can look back on his college course and see both its advantages and disadvantages much better than a graduate of this year. Great as the disadvantages may be under which the college is now laboring, the writer feels, and believes that most graduates will agree with him, that it would be a great mistake to separate the college of agriculture from the university and move it bodily to Davis.

Collier's Magazine recently ran a

series of articles on our American colleges by several of the most prominent business and professional men in the country. Diversified as their several interests were, throughout all the articles ran a similar thought, which was that the colleges should give the student a thorough training in fundamentals rather than specialized training alone, that he should be taught to think, to view things broadly, to have a keen understanding, as distinguished from mere technical training. The importance of the latter was readily recognized, but emphasis was placed first on a very thorough preparation as a foundation, and then on the proper technical training.

The courses in the college of agriculture at Berkeley are practically all founded on certain basic sciences, such as chemistry, botany, physics, biology, etc. These must be taken in order to lay the proper foundation for the advanced agricultural subjects to follow. Having taken these basic courses, the student is able to readily comprehend the whys and wherefores when he gets into agricultural chemistry, stock feeding, plant and animal breeding, etc.

Along with these fundamental elementary courses for the first two years are given others in economics, history, English, mathematics, etc., which are recognized as necessary in a balanced education. These elementary, and the so-called cultural

courses, go a long way toward training the mind and broadening the viewpoint, so the student is well equipped to tackle the more technical problems along the line he has chosen to follow, whether it be animal industry, fruit (Continued on Page 115.)

DUTY OF WATER

(Continued from Page 93.)

lower lands by seepage. Fortunately the alkali problem does not affect a very large area of citrus orchards at present. Careful attention to the economic use of water will doubtless delay and possibly prevent serious alkali effects in later years, while such effects might easily be expected to follow careless or extravagant use of water.

Many of the details, such as the length of time water should run in a furrow and the rate at which it should run, must be left to the individual irrigator. Each individual will likely find that his practice must be varied for each irrigation, depending upon the degree of dryness of his soil or the development of plowsole. The penetration of the plowsole and the prevention of run off are also rather individual problems. Thus it is that the experience of others is of most value to us, not when we attempt to adapt it in its entirety, but when it causes us to see our own problem more clearly or from a new viewpoint.

Your Rail-less Railroad

YOUR live stock and the produce from your fields, carried in freight trains to the cities, thunder past countless danger-signs with the warning, "Look Out for the Cars!" Each one of these marks the crossing-place of a country road—a road without rails, leading to railroad and town. Each one marks a farmer's right-of-way.

Since your farm is a 1920 enterprise, probably it is fitted with most of the following modern equipment—the telephone, good lighting and heating, a silo, a manure spreader, a cream separator, an automobile, an engine, a tractor.

But have your hauling problems found their proper solution? Are the time-losses and difficulties of a decade ago still impeding your endless carrying of farm loads?

Government statistics show that in

1918 alone, 350,000,000 tons of farm produce were transported to local shipping centers in motor trucks. The same national figures prove also that American farmers are the greatest users of motor trucks—among all industries. No progressive farmer can afford to overlook impressive facts like these.

Your name and address mailed to our office at Chicago will bring you descriptive folders that will prove interesting and instructive. Put an *International Motor Truck* at work on your farm and on the roads which are your right-of-way. Handle all your miscellaneous farm hauling with railway efficiency. The nine *International Motor Truck* sizes range from ¾ ton to 3½ ton. Keep in mind that these trucks have been made for years by the makers of good and trusted farm machines.

Harvesting Sweet Potatoes

THE growing of sweet potatoes has become an extensive industry in Texas within recent years. To meet the general demand for information as to most profitable handling of the crop, the Texas college of agriculture has just issued a bulletin from which we take the following points on harvesting, which will be of interest to the many sweet potato growers of this state:

Dig at Right Time

A great deal of success in storing sweet potatoes depends on the way in which the crop is handled in the field. Except for early marketing, sweet potatoes should not be dug until they are well matured, as immature stock is much harder to cure and to keep. Sometimes an early frost will injure the crop, but ordinarily the season in Texas is such as to allow full maturity. It is never safe to take chances on a late frost. Where a dry summer precedes a wet fall most growers are often inclined to delay digging until too late in the season. Where this is done there is danger that the potatoes will become frost bitten in the field. If the vines are merely frosted, the potatoes are still safe for storing, but they should be dug as soon as possible. On the other hand, if the frost has killed the vines to the point of injuring the tips of the potatoes, there is little chance of the crop keeping well. If this condition arises, the potatoes should be sold immediately for early use.

The natural yellowing of the foliage is usually a good indication that the potatoes are ready to be harvested. Another test for maturity is to cut several potatoes and if the cut surfaces become white and dry in a short time the potatoes are mature; on the other hand, if the cut surface remains moist and turns to a darker color, it is an indication that the potato is immature. Furthermore, the skin of the mature potato cannot be rubbed off as easily as that of an immature one.

Digging Hints

The potatoes should be dug as carefully as possible, avoiding all unnecessary bruising. For this purpose a plow with two rolling colters attached to the beam to cut the vines, and several steel prongs on the mold board to separate the soil and the vines from the potatoes makes a very handy implement for digging. A "middle buster" with rolling colters also does satisfactory work. A common mistake is made in not going deep enough with the plow, and as a result many of the potatoes are cut or bruised. The best time to dig is during warm, dry weather, since the potatoes, especially the bruised ones, are more likely to rot when dug while wet; besides, the potatoes dug during wet weather will be more watery, and hence harder to cure. However, in wet seasons the grower will often be forced to dig when potatoes are wet and muddy. Under these conditions sweet potatoes require extra care in that they must be dried quickly and the moisture not allowed to stay on the potatoes for any considerable length of time. Wet potatoes should never be stored in great bulk, but should be spread out in small quantities if possible. It is poor policy to dig the potatoes late in the field, as they may be injured by frost or rain. Neither is it wise to dig early in the morning when the ground is more or less cool and the vines wet with dew.

The best time to dig is after the sun is well up and not later than three or four in the afternoon, or until such a time that the grower will be able to pick up before night all that he has dug. It is not safe to allow the potatoes to remain exposed long to a hot sun, although a mild sunlight will help them to dry off.

Grading

The potatoes should be graded while being picked up. To do so will save time, labor and excessive handling. Some of the pickers should gather the No. 1's and others the No. 2's, and still others the bruised, the cut and the jumbo grades. Mechanical graders are being perfected, and no doubt they will play an important part in the fu-

ture in the proper grading of sweet potatoes.

Handle With Care

Potatoes should be handled with extreme care and as little as possible if they are expected to keep well. Where storing is done in hampers, baskets or crates, it is best to gather the roots in these containers and place in the house as soon as possible. They should never be handled in sacks or hauled loose in a wagon box. When the potatoes are hauled from the field to the

Cutting Labor Costs in Irrigation

EVERYTHING the farmer has to buy, from a jute sack to a 40 horse power tractor has gone up and up in price since the peaceful days of 1913. Feed and fertilizer, fuel and flapjacks have climbed to perches wholly out of reach of anyone not equipped with a step ladder and a grappling hook. But perhaps the most effective change in increasing the farmer's outlay is the increased cost and surprising scarcity of farm labor. There never was a time when labor saving devices were so essential to success. In these days the rancher who has so equipped his place with labor saving tools and machinery that one man can raise the crops and attend the stock that formerly required the labor of two is reaping a deserved reward for his foresight.

It is just as practicable to reduce the labor of irrigating by the use of modern equipment as that of plowing or harvesting. Old style wooden gates and flumes demand extensive repairs and labor once a year to keep them in working condition, and after a few seasons must be entirely rebuilt. They always leak more or less (generally more) and sometimes permit the flooding and scalding of valuable crops. Sometimes, in the dry season, they get afire, as a result of weed or brush fires creeping up about them, and hundreds of dollars worth of lumber and labor go up in smoke.

The shrinking, and warping which they undergo in dry seasons makes their water holding qualities more like those of a basket than a pail, and the swelling which ensues after the water is turned in makes wooden slides and flash boards stick and balk like an old fashioned barn door over a settling sill. There is an unconfirmed rumor that one farmer was moved to use unseemly language by the behavior of a wooden check under such conditions.

Wooden gates and flumes compare with the corresponding articles made of metal about as the wooden plow of

house they should be placed directly in a spring wagon and carried over the smoothest road, the aim, of course, being to avoid unnecessary shaking and jarring, which injures the potatoes. It is also necessary to fill the crates and to place the cover tightly on top so as to prevent jolting. If a spring wagon is not available, a deep layer of straw or hay should be made in the wagon box.

It is very important to prevent bruising, which is mostly caused by rough handling, because bruised potatoes are harder to keep, and even if they go through the storage period without rotting, they are practically unmarketable on account of their unsightly appearance.

ancient days compares with its twentieth century successor. Their operation calls for the use of twice as much time and strength and the results achieved are much more uncertain. Wooden irrigating devices should always be operated by careful and responsible men, whereas the opening and closing of metal gates, being easier and surer, may sometimes be left to cheaper assistants. When the owner of a small farm who has no hired help has to be away for a day or two, the working of a few metal gates, the heavier types of which are provided with hand wheels, need not be especially burdensome to his wife or half grown son.

Cast iron automatic drainage gates do away with all the labor connected with the drainage of lands which lie between the high and low water levels of near by ditches, rivers or bays. Attached to sections of corrugated pipe which run through the dike or levee, they readily swing open to allow the flow of water from the land, but close tightly when the water level in the ditch or stream is raised, and permit of no back flow. Once installed they will perform their work for many years with little or no attention from the owner.

The farmer with small or large acreage to drain or to irrigate, who makes no use of metal gates, adjustable irrigation dams and other articles which have been devised to lighten his labor is in a position similar to that of the one who refuses to see the advantages of a planting machine in place of hand dropping in the furrow, or of wire fencing in place of rails. The Biblical command to the worker whose tools were dull was to "Put forth more strength. Strike fiercely and many times." Californians get more results by holding them for five minutes on a grindstone driven by a gasoline motor, or by junking old style tools altogether and substituting modern devices that do the work themselves.

Organized Protection

CALIFORNIA bean growers, in fact, bean growers of the whole country, have had a real problem in disposing of their 1919 crop at a price which would pay for the labor of preparing the ground, cultivating, hoeing and harvesting. Profit has hardly been considered. The Eastern growers are talking of cooperation as a means of securing fairer prices and to that end will hold on August 17, either in Lansing, Michigan, or Chicago, Illinois, a meeting at which bean growers of the United States are asked to gather and devise ways and means of perfecting a nation wide organization.

Bean growers of California are looking to legislation for relief. In his address before the recent annual convention of the California Bean Growers Association, President Mendenhall touched upon every phase of the bean question that had to do with production. He said:

"We are confident that the growers in the main realize the necessity of an organization to protect the bean industry which means so much to the state and to each and every bean grower's prosperity.

"During the year investigation was made of the advantages of selling hand picked package goods under brands of the association; also the

cost and benefits of advertising. The possibilities of securing sacks at low cost for the growers were looked into, but it was not deemed advisable to enter into any of these activities, at least until such time as the association is in a stronger financial position, particularly with reference to surplus working capital which can be safely appropriated for these purposes.

"It is believed that a proper accounting system has now been worked out, and as soon as the bulk of the heavy work in connection with the handling of the large 1918 crop has been completed, a perfected system will be installed.

"Some study has been given to amending our present contract when the present period has run out, with the view of eliminating unworkable provisions, strengthening powers and widening the scope of the association's activities. One of the weakest points of our present contract is the right given the members to withdraw beans on April 1, 1920. This gives rise to complications in accounting and selling which are almost insurmountable. Even now some few members have not expressly stated whether or not they have withdrawn their beans as of April 1, which leaves the association officials in doubt as to just what course to take. The accounting in

such cases must also necessarily be held in suspense.

"I cannot conclude this report without commenting on the apathy of many of the members in reference to the request of the management for the legal consents for moving the offices from Stockton to San Francisco. This was a small matter, and yet the fact that many members neglected to send in these consents has caused extra expense and difficulties in connection with holding the annual meeting of the association. I trust that members will cooperate a little more promptly in the future in such matters.

"It has been the conclusion of the management that the association must necessarily give more attention to its organization department and the district field work than is the case with other associations. A bean crop may be raised on a particular parcel of land one year and then a crop may not be raised for three or four years. Hence, the areas planted to beans will constantly change and the actual bean growing membership will continually shift. Because of this condition it will be necessary in order to maintain a successful association to carefully canvass the bean sections each year during the growing season and prior to harvest in order to secure control of a sufficiently large volume of beans to make the association a complete success. This shifting condition and the changing proportions of the varieties raised makes the bean industry essentially different from the fruit, raisin and nut industries, where the orchards and vineyards are fixed, ownership stable and crops permanent.

"For these reasons it is very essential that we maintain the district managers and district offices. These officials can also be of much direct personal service to the growers by giving information and advice and keeping the growers more directly in touch with the affairs of the association.

"In order to secure the greatest measure of success we believe a canvass should be made in Southern California before the next harvest in order to secure a wider control of the industry. Requests have already been made by growers south of our present field of activity for membership in the association. It is felt also that farmers in the Los Angeles territory are quite familiar with association marketing methods and that extending the operations of the association in this section would not be difficult or expensive."

A NEW WEED PEST

During the past few years a serious weed pest has slowly but surely been extending over the southern half of California. In light sandy soils its multiplication has been rapid. It is called the "ground burnut" and its proper or botanical name is *Tribulus terrestris*, though the name "troublous" would have answered equally well.

The department of botany, University of California, writes:

"We have certain information that the so-called ground burnut" occurs within the borders of counties listed below. This weed is unquestionably becoming a serious pest in a number of places in the southern half of the state, and it would seem highly desirable that some concerted effort be made to insure its eradication: Counties of San Joaquin, Tulare, Monterey, Kern, Los Angeles, Imperial."

Added to this the writer last week saw thousands of these weeds growing in the western part of San Bernardino County, and it is safe to say they are becoming common in every county in the south half of the state. The plant grows flat along the ground, has a small, deep yellow flower and leaves resembling those of a vetch. A strong plant may become ten feet across, but this size is unusual. The chief distinguishing feature for recognition is the very symmetrical and somewhat attractive spiny nut. It is about a half inch across, of beautiful formal design suggesting a five pointed Greek cross. Often only flowers and leaves are seen above, but if the plant is turned over the maturing "nuts" will readily be found. This weed should be eradicated wherever found.—E. B.

The Milk Producers Association of Central California has withdrawn from the state association because it did not wish to join in the scheme for standardization of products throughout the state.

With this combination one man can plow 6 to 9 acres in 10 hours.

With this combination one man can plow 10 to 14 acres in 10 hours.

With this combination one man can plow 14 to 18 acres in 10 hours.

Relieve Shortage of Farm Help!

GOOD farm help is scarce. Conserve it by making the most of what man-power you have.

A Case Kerosene Tractor and the properly related size of Grand Detour Plow makes farm help more efficient—more productive,—and less costly in proportion to the results accomplished.

Just consider the advantages of having one of these outfits on your own farm. Don't forget the importance of being able to do your plowing rapidly when the soil is in the most favorable condition. Then consult the nearest Case dealer.

Remember, Case Kerosene Tractors and Grand Detour Plows are both built by the J. I. Case Threshing Machine Co., and give best possible results when used together.

Write for catalogs showing our great line of Power Farming Machinery.

Arizona Cotton Land

We offer for sale a few select tracts of Arizona Long Staple Cotton land, 160 to 640 acres, at \$40 to \$75 an acre. Some of the finest land to be found anywhere in all Arizona, close to railroad, absolutely free from alkali, hard pan or adobe; no better soil ever lay out of doors. Lies fine for irrigation and an abundant supply of water can easily be developed at depths of 35 to 70 feet on the different tracts. Will produce wonderful crops of cotton, alfalfa, fruits and vegetables. One good crop of cotton or one season's alfalfa crop WILL MORE THAN PAY THE ENTIRE COST OF THE LAND AND WATER PLANT. This land is easily worth two to three times the price asked, which is made for quick sale. We are ready at any time to show any of this land to bona fide prospective purchasers. Call or write at once if you wish to get some of this land being offered at bargain sale. It will not last long.

When Writing Advertisers Mention California Cultivator

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Camphor Culture

Have you any literature on your files regarding camphor culture and production? Could you advise where to write for same?—Subscriber, McFarland.

Write to Department of Agriculture, Washington, D. C. Some literature has been issued on the subject, dealing mainly with experiments made in Florida.

Bougainvillea Blasting

My bougainvillea, which bloomed a solid mass, is now turning yellow on the flowers. Is it time for this, or what ails it? Shall I spray for insects as I do my roses?—Subscriber, Perris.

As only blossoms are turning yellow it is evidently not affecting the whole plant and is therefore from an outside cause. It may be from sunburn in a very hot spell, but probably is due to "red spider." Would advise spraying at once.

Chrysanthemums Dying

I enclose root of chrysanthemum from plant four feet high, from one of many plants that have died. Can you tell the cause and remedy? I fed them nitrate of soda about four weeks ago.—Subscriber, Crockett.

The root system is perfect and neither roots nor stem show injury or infection from insects or disease. If injured by too much nitrate of soda it should have been manifest earlier than four weeks subsequent to application. We cannot suggest cause of death.

Corn Worms

Several growers who have asked about corn worms are advised to sprinkle arsenate of lead powder on the silk very soon after it appears. If it rains repeat the powdering. A pinch between the fingers is usually sufficient for an ear. The moth lays eggs on the silk, the young worm hatching and going down the silk mass to the ear, where it feeds on the kernels.

Rhodes Grass

I have just read an article in the California Cultivator, written by M. E. Bemis, in which article he mentioned Rhodes grass. I have 160 acres of land which I think well adapted to that grass—clayey, slightly alkaline, breaks up nicely when dry but runs together when wet and bakes when drying. I succeeded in getting a good stand of Sudan on ten acres of it a few weeks ago by keeping the land wet until it got through the surface. It is doing well and I believe I can get Rhodes grass up in the same way, but before planting a large area to it would like to know a few things about it. Is the cured hay equal or nearly equal to alfalfa as stock feed, and does it sell for approximately the same price? Will it kill it to irrigate it and let the water stand on it for a few hours when temperature of atmosphere is 100 to 110 in the shade?

Mr. Bemis answers: "I do not believe that where conditions are favorable for alfalfa and Sudan that you would find Rhodes grass advisable. While Rhodes grass has made big yields for hay or for silage, it could not compare with Sudan where conditions are favorable for the latter. Where there is some alkali it is quite probable that the Rhodes grass might do better, especially for pasture. The

chief advantage of Rhodes grass would be, as I mentioned in the Cultivator article, under adverse conditions such as a shortage of water, slight alkalinity or where a more or less permanent pasture is desired. Rhodes grass is somewhat on the order of Bermuda grass and would not have to be reseeded. It is propagated by seeds and by rootstock runners, somewhat the same as Bermuda, but is very easily eradicated and does not become a pest. In the Southern states, as you know, this has become a very popular hay and pasture grass. Prof. J. J. Thornber, botanist of the Arizona college of agriculture, speaks very highly of Rhodes grass. His observations, however, I take it, have been more under range conditions than in irrigated sections. At the station farm at Mesa in the Salt River Valley it has been found somewhat difficult to secure a stand, and it has not given results which would indicate that for irrigated sections like the Salt River Valley it would compare with the Sudan or alfalfa. In feeding value it would probably rank about with timothy, although I do not have the analysis. Being a non-leguminous plant, it would of course be deficient in protein. My suggestion would be that you try only a few acres, as there is no possible way that you could determine beforehand whether it would be a success or not, and you would not want to make a failure of 160 acres. Your method of irrigating the Sudan grass might work with this. Our usual practice here (Salt River Valley, Arizona) is to get sufficient moisture in the ground to bring the seed up. I should be inclined to try, if possible, thoroughly saturating the soil, sowing the seed as soon as the land was dry enough, and then running a corrugated roller over it to prevent baking as much as possible. I believe in this way you would succeed in making a crop, but you know your soil and climatic conditions better than I do and it might be that you would find it advisable to keep it as wet as you did your Sudan grass."

Sulphured Fruit

Is there any method for drying and preserving fruit such as apples, peaches, pears, etc., without the use of sulphur?—Subscriber, Beaumont.

Yes, some fruit growers prefer for their own use unsulphured fruit and dry either in sun or evaporator. Unless the fruit is cut very green and consequently of low quality, it will darken. Fully ripened peaches show very dark, sometimes almost black shade, hence are not marketable, but, as noted, preferred for flavor by some. We who "eat with our eyes," however, have formed a liking for the sulphured fruit. It is vastly more attractive; it has fine flavor, and, so far as we have ever heard, is perfectly healthful. We recently had short communication from a subscriber who maintained that he could not eat the sulphured fruit. This is a matter of individual decision, but as a commercial proposition we think sulphur will be used pretty nearly as long as California grows fruit. We find it far preferable to take our sulphur this way rather than as in boyhood days, when we were forced to take it with cream of tartar and molasses. We know of no substitute for the sulphur. A slight benefit is received if the fruit is put into the evaporator or into the direct sun heat as quickly as possible after cutting. It must be borne in mind

that there will also be much greater loss from souring and spoiling from fruit on the trays, especially if a streak of damp weather sets in, if there has been no sulphur used. The time required for drying will be about twice as great as where sulphur is used. This can be overcome somewhat by cutting fruit in very small pieces.

Wilt of Tomatoes

Will you please tell what causes tomato vines to curl up and die? Is there any remedy for this disease?—Subscriber, Owensmouth.

Presumably this is the regular summer wilt. If so, there is no help for it. See this department in former Cultivators.

Stock Beets

What month is best to plant stock beets? How long are they in maturing? What is the average weight of the beets? How often should they be irrigated? What variety is best for hog feed? What is the experience of your readers in feeding them?—Subscriber, Lemoore.

If ground can be irrigated the seed should be sown before the first cold of winter. If well started before that they will grow through the winter. If sown before first rain soil should first be irrigated. The average time to maturity is about four months, some varieties longer. They should weigh ten pounds each. Imperial, Half Sugar Rose and Golden Tankard are some of the good varieties; there are others. Winter beets should need no irrigation. If planted in February irrigate once a month during summer. One subscriber says he raises hogs without other food. We would not.

Summer Blight

Tomato leaves are turning black over all the field. What can I do?—B. Iguchi, San Fernando.

This is summer wilt, evidently, for which no remedy has yet been found. Spraying is of no use. Soil is a storage place for the fungus and either new soil for at least one season should be found for the tomatoes or another crop grown for at least one year.

Worms and Wilt

One-half of our watermelons die. What is the cause and remedy therefore? Also, something eats under side of melons and cucumbers.—M. Kamada, San Fernando.

Melon wilt is no doubt your trouble and an early spray with Bordeaux mixture would control it, but it is now perhaps too late. The eaters of fruit are probably millipedes or "wire worms." Lift the melons out of place, spray soil with Bordeaux mixture and replace melons. One treatment usually is sufficient.

Pruning Tomatoes and Berries

Will you please tell us in your valuable paper how and when to prune tomato vines; also raspberries, blackberries and dewberries.—J. W. H., Anaheim.

The summer crop of tomatoes should not be pruned, as all shade is needed. Pruning of winter tomatoes is done to let the sun into the thick vines only. This should suggest how to prune. It may be done at any time. Berries are best pruned in August and practice varies with individuals, soils, climate and conditions. The aim is to get rid of the oldest growth. Small growers pinch terminal growths while soft, others use shears, some sickles. All this is to restrict growth and cause heavy branching.

Irrigators on the west side of the San Joaquin Valley are talking West San Joaquin district. The idea is to cover lands in Merced, Fresno and San Joaquin Counties.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Judgment Does Not Outlaw

Will a judgment outlaw? — Subscriber, Sisquoc.

The party in whose favor judgment is given may at any time within five years after the entry thereof have a writ of execution issued for its enforcement. After that time, by leave of the court by motion or by judgment for that purpose founded upon supplementary pleadings, the judgment may be enforced or carried into execution. There is otherwise no limit upon the time of enforcement of a judgment.

Note Lost

What is the proper procedure in case a note and mortgage on real estate, duly recorded, have been lost? —Subscriber, Long Beach.

In the action to foreclose the mortgage, it may be set forth that the original has been lost, but in any case the original record of such instrument or a certified copy thereof may be read in evidence with the like effect as the original instrument without further proof.

Road Right of Way

Some time ago I gave a party verbal permission to cross my land. I have a sign on the way which he travels marked "Private Road." This man has given permission to another to travel over this road without asking me. He claims that he has put in \$600 in improvement on the road and that it is his road and that I cannot prevent him from traveling it. He states that if I attempt to stop him he will get three men to appraise the land and sell it at public auction. How long would the law require that he travel over this land in order to acquire a right? There is another old road formerly used by miners, but long since abandoned, except for occasional travel. Can this be called an open road?—Subscriber, Hemet.

The party passing over the road, claiming openly and notoriously and adversely to the owner to have that

right, and also exercising acts of ownership over the road by way of improvement and giving permission to other parties to travel thereover, would undoubtedly be presumed after the expiration of five years to have acquired such right of way. In order for the owner to resist this right it would be necessary for him to bar the way or bring an action either in trespass or in nature of an action of ejectment to establish his right to the land. The mere sign "Private Road" would mean nothing in this particular case, because with two or three parties using it it can still be a private road. The claims with respect to the appraisal of the road are only partially correct. The political code provides that a private road may be opened, laid out or altered for the convenience of one or more residents or freeholders of any road district. In order so to do, it is necessary that such resident file his petition in writing with the board of supervisors, setting forth the general route of the road and name of the person or persons over whose land it is to run. This petition must be accompanied by a bond approved by the board of supervisors double the amount of the probable cost of viewing and laying out the road and in addition that the bondsman pay all costs in case the prayer is not granted. On filing this petition the board of supervisors, if they deem it advisable, may appoint three viewers, one of whom must be a surveyor, to survey the road and submit to the board an estimate of the cost thereof, including purchase of the right of way and their views of the necessity. The owner of the land shall be notified at the time they are to view it. The road viewers thereupon report to the board of supervisors the details with respect to the road, the probable cost of construction, estimate of damage to the owner of the land, the names of the land owners, both those consenting and those who do not consent, the amount of damage claimed, and also the feasibility and cost of another route than the one petitioned for. The board of supervisors, after filing the report, set the day for hearing, give notice to the non-consenting land owners of the day of hearing, and on the date set hear

the evidence for or against the road and ascertain the amount of damage awarded to the non-consenting land owner, if the board deems it advisable to open the land. If the land owner does not accept the awarded damages within ten days it is to be deemed as rejected and the board of supervisors then may direct that condemnation proceedings be instituted in the superior court to condemn such right of way. In case the petition is not granted in any state of the proceedings the bondsmen of the petitioning party must pay to the person over whose land the road is sought the necessary costs and disbursements of such party in contesting the road. All such private roads, wherever practicable, must be located upon section or half-section lines. As to the old mining road, it is quite probable that it has long since been abandoned and your simplest proceeding there would probably be to fence it in.

AMERICAN SHIPPING

American seagoing ships of 1,000 gross tons or over registered for foreign trade or enrolled for the coasting trade, according to the returns of the bureau of navigation, department of commerce, on June 1, 1920, numbered 2,801 of 10,681,025 gross tons, of which 1,610 of 6,801,536 tons are owned by the government of the United States, represented by the United States shipping board and built with appropriations by congress. To these larger seagoing ships, smaller seagoing vessels, the Great Lakes fleets, and vessels on rivers and canals may be added, giving a total of approximately 27,900 vessels of 15,850,000 gross tons under the American flag. The precise figures for smaller vessels will not be available until the end of the fiscal year, June 30.

Practically all the weaving in Guatemala is done by Indians with home made wooden hand looms. In certain districts whole villages are devoted entirely to the weaving of native cloth, with one or more looms in every hut. Conversations with the principal importers tend to develop the opinion that the only reason the United States does not secure a fair proportion of this trade is because American manufacturers refuse to put up yarn in skeins of the size and weight desired by the Indians.

"TEST SPECIAL"

THE RUBBER BELT OF SERVICE

OUR FREE SERVICE DEPARTMENT

We maintain a Service Department for the benefit of the belt users throughout the Pacific Coast. We answer any queries regarding belt trouble.

See your Dealer.

Any dealer anywhere can buy "TEST SPECIAL."

WRITE TODAY, giving the R. P. M. and diameter of the driving pulley—also driven pulley and distance between centers of same, also give the rated horsepower of your motor or engine, and name kind of machinery you are operating. We will reply immediately giving you our recommendation as to kind of belt to use.

WRITE TODAY.

No matter how hard the drive or severe the conditions "TEST SPECIAL" Rubber Belt is one you can rely upon. It is made right.

All plies pull as one, each being a belt in itself. If chosen for the work for which it is intended "TEST SPECIAL" will give longer and better service than any rubber belt made.

Milking Shorthorn Bulls

I am offering four young bulls of serviceable age and choice eastern breeding at \$250.00 to \$275.00 each. These bulls are good enough to go into any herd and priced within the reach of all. Write at once for information.

Thos. Harrison

Santa Rosa, Cal.

IOWA THE CATTLE STATE

The value of the cattle in Iowa is greater than in any other state in the Union by far. It is stated that Texas has twice as many cattle as Iowa, but that the value of Iowa's cattle is double the value of the Texas cattle. Perhaps there is a reason.

There are over 5,000 breeders of purebred Shorthorns in Iowa, vastly more than of any other breed.

Think this over. It pays to grow Shorthorns.

AMERICAN SHORTHORN BREEDERS' ASSOCIATION
13 Dexter Park Ave. Chicago, Illinois

CARRUTHERS SHORTHORNS Bulls For Sale

Just now this herd can supply a number of exceptionally high class young bulls that are just the sort for range improvement. They are well bred, thick fleshed, heavy boned, and good colors—and they are priced to sell.

Carruthers' bulls will be found on many of the best ranges in the West—there is a reason.

We also have Berkshires.

Visit the farm or write for prices.

Tuberculosis in Dairy Cows: What It Costs

By Dr. J. P. Iverson

TUBERCULOSIS is caused by micro-organisms commonly known as bacillus or bacterium tuberculosis. There is no other disease known to man that affects more species of animals. Mammals, birds, reptiles and fishes are susceptible to the infection. While there are some species which present a higher resistance to the organism, there is none possessing an absolute immunity. Man is the most highly susceptible and statistics show that about one-seventh of the total human population die of tuberculosis. Of the domestic animals, the bovine is apparently the most susceptible, closely followed by swine. Fowls, horses, sheep and goats are also subject to the disease.

In its relation to man, the distribution depends to a great extent upon the close proximity of the inhabitants, while among the domestic animals the proportionate distribution seems to relate to the interest manifested in animal industry. There is not a nook or corner of the world which has not been visited by this infection.

Introduction of Infection

The infection gains entrance to the body through various channels. The lungs, which are so often infected, usually become so through the inhalation of dust contaminated with the organism. When the lungs are infected either in man or in animals they oftentimes cough up great numbers of the bacilli in the sputum, that when deposited on the ground, mixes with the dust, and other non-infected persons or animals breathing the contaminated dust in turn become infected. Another common avenue of entrance of the germ into the body is through the digestive tract, through the medium of infected foodstuffs. According to eminent authorities, the mucous membrane of the digestive tract of very young animals is extremely vulnerable. Infection also may gain entrance through the udder or genital organs, but these cases are rare. The unbroken skin resists the infection, but an abraded part will permit the entrance of the organism.

The tissues in the region infected, in their effort to resist the irritant produced by the bacilli, form small, characteristic nodular swellings, commonly known as tubercles. As the tubercle bacilli multiply and continue to throw out their irritant, the invaded tissues in turn continue to build up a wall of resistance, and in this manner the tubercle may grow to a considerable size. This battle continues until finally one or the other is conquered, and then the bacilli are either walled off and finally killed or they break through the impediment formed by the low resisting tissues and are carried by the lymph or bloodstream to various parts of the body where other tubercles are formed in a like manner. The toxins produced by large numbers of the bacilli are absorbed into the system and the vitality of the infected person or animal is gradually lowered, and death concludes the struggle.

With a knowledge of the dissemination of bacilli in the infected individual, it becomes evident that the organism may lodge in any part of the body. This fact should not be lost sight of when a post-mortem is performed on a carcass to determine the location of the lesions. The percentage of cases of tuberculosis presenting characteristic clinical symptoms is extremely low. This lack of diagnostic symptoms is often the reason for a serious spread of the disease in a herd before its presence is suspected. The usual slow and insidious method of development of the disease is one of its characteristic features, and for this reason its progress is often quite extensive before its presence can be detected without the aid of the specific diagnostic agent known as tuberculin.

Tuberculin

Tuberculin was prepared in 1890 by Robert Koch. He administered it to tuberculous patients with the hope that it possessed therapeutic value. The reactions obtained after its administration led scientific investiga-

tors to feel that a specific for tuberculosis had been discovered.

Later it was generally conceded that tuberculin possessed little therapeutic value, but the reactions following the administration of tuberculin into the tissues of tuberculous individuals gave to the world a diagnostic agent, which is regarded as one of the greatest achievements of modern science.

Tuberculin is prepared by cultivating the bacillus on specially prepared bouillon medium, grown usually for eight or ten weeks at body temperature. At the end of this period the medium is charged with the products produced by the growing culture. The culture is then exposed to moist heat and killed, and the whole product filtered. The filtrate is evaporated to the required concentration, which is usually one-tenth of the original volume and from this the diagnostic tuberculin is prepared.

A typical positive reaction after the application of the tuberculin test demonstrates to a high degree of certainty the presence of tuberculosis. The small number of cases in which the post-mortem does not reveal lesions may be attributed to the extreme sensitiveness of the reagent, which produces a typical reaction when the lesion is so small that it might escape attention in the course of a most careful autopsy. A small tubercle not larger than the head of a pin, located in the depths of a large organ or a remote lymph node, may produce as marked a reaction as a larger lesion. The intensity of the reaction is no indication of the extent of the tuberculous lesion, because quite frequently a minute lesion produces a pronounced reaction after the application of the tuberculin test.

Testing Various Animals

The application of the tuberculin test is not limited to any particular species of mammals or birds. It may be practically applied to any of them with equally accurate results when performed by one familiar with the technique.

Our efforts to eradicate tuberculosis have been devoted to cattle while, as a matter of fact, there are great numbers of swine and fowls also afflicted. To completely eradicate tuberculosis existing among domestic animals it is essential that we bear in mind that all are to some degree susceptible to the infection and all necessary precautions should be taken to prevent their exposure to the infection. Any species of mammal or fowl reacting to the tuberculin test should be at least isolated immediately from all others that are healthy and thereby avoid their becoming exposed. Some authorities contend the radical method of slaughtering all animals harboring the tubercle bacillus is the most effective method of eradicating the disease.

Economic Importance

The wide distribution of tuberculosis among our animal population causes serious losses annually. Just what these total in dollars and cents is hard to give in exact figures, since there is such a wide range in reliable statistics.

When the dairy herd becomes infected there eventually is a reduction in the milk supply. And again its presence in the herd may lead to cases of abortion and not uncommonly many cows finally die of the disease.

Purebred stock also come in for their share of the disaster when tuberculosis makes its appearance among them. The breeding of such stock represents the lifelong efforts of breeders for several generations. Through this continued scientific breeding such stock reaches a valuation of thousands of dollars and, since there are but few animals in such a herd, the loss of one by death from tuberculosis, or by interference of the reproductive organs from the same cause, diminishes or completely destroys the prospects for the future of those engaged in this field of animal husbandry.

Besides the losses in the herd, it is more than likely that young animals have been sold into other herds for breeding purposes, thereby giving a wider distribution of the disease. No doubt many ranchers have introduced

TESTIMONIALS

"Cows increased in one week 3 per cent in milk."

A. L. McCULLOCH, Alpaugh, Cal.

"I never saw hogs do so well or grow so fast as on this molasses ration."

C. H. HARTWIG, Yuba City, Cal.

"It has enabled me to keep my stock in better condition at less expense."

J. M. HENDERSON, JR., Sacramento, Cal.

"Have one calf that refuses to drink new milk—prefers skim milk with molasses. What do you know about that?"

R. HECKLEY, Santa Rosa, Cal.

"It has been a great advantage in getting the stock to clean up the roughage."

H. H. AMES, Chowchilla, Cal.

"One cow will turn down the choicest handfuls of alfalfa hay unless it has been 'Molassed'."

San Francisco, Cal.

this trouble into their herds by purchasing new animals with the thought of improving their stock, without first taking the necessary precautions to guard against tuberculosis.

The condemnation of carcasses upon slaughter by federal meat inspectors is quite considerable, amounting to 103,438 in 1919. Thousands of animals are killed by state and municipal authorities, as well as by private owners. The Year Book of the United States department of agriculture states that the percentage of tuberculosis among animals slaughtered at noninspected abattoirs is greater than that at establishments under federal inspection.

Bovine-Human

In 1882 Robert Koch discovered the bacillus tuberculosis. The discovery, together with its constant associations with tuberculosis of all the species, led to the conclusion that tuberculosis was transmissible from one species to the other. Later Koch advanced the theory that a difference existed between mammal and human tuberculosis. This led to world-wide scientific investigation along this line, resulting in the conclusion that they are so closely allied that it is impossible at this time to regard one as being separate and distinct from the other.

With all the available evidence it is safe to conclude that although, in the great majority of cases tuberculosis is transmitted from man to man, the dispensing with such articles of food as meat and milk from tuberculous animals for man, and especially so in the case of children, would indeed prove a rational sanitary measure. On the other hand, milk from non-tuberculous cows is recognized as one of the most wholesome and nutritious foods for young and old, and the liberal use of milk, as a food, is highly recommended.

Eradication.

Since tuberculosis has been proven by the foremost scientists of the country to be absolutely preventable, it behooves us to exclude from our premises and herds the germ or bacillus tuberculosis.

Many preventive measures are now in use, and while the method of application may vary according to surrounding conditions, all are based on the effort to prevent healthy and diseased animals from coming in contact with one another, as well as with infected foodstuffs and premises.

While government or state aid is a great help, the private owner is responsible for the admittance or non-admittance of tuberculous animals into his herd. As far as municipal measures are concerned, the establishment of meat and milk inspection is a great aid in the suppression of bovine tuberculosis. In the establishment of such a regulation, cattle owners and authorities in livestock sanitary matters are furnished with information regarding the existence of disease in the various herds and on those ranches from which butcher stock is obtained. The proper cooperation between livestock authorities and municipal meat and milk inspectors brings about the desired results. Hand in hand with municipal meat inspection we should have state supervision of slaughtering establishments and dairies. In this manner much information would come to light upon which it might be well for the state or the private citizen to act.

With regard to state measures, first of all the tuberculin test should be required for all animals introduced into the state, which is now being done in California. In this manner much can be accomplished by refusing to admit animals unless shown to be free from tuberculosis.

Each state should enact suitable laws to control and eradicate this disease. It should be borne in mind, however, that various local conditions may exist in one state that may not be found to exist in another. For this reason it appears that the enactment of laws for the suppression and eradication of tuberculosis must be worked out by each individual state in such a manner as to enable it to join with all other states in a united effort to insure livestock against the ravages of tuberculosis.

As long as tuberculosis is a matter which concerns the public expert advice and assistance should be given. In the distribution of free bulletins, pamphlets, circulars, etc., bearing upon the knowledge of the disease, a great

deal of good can be accomplished. Another avenue of prevention is through the supervision of breeding establishments, since purebreds are often the cause of a wide dissemination of the disease. This sort of danger would largely be done away with under sanitary supervision. The spread of the disease might be lessened further by having enacted prohibitory laws which would prevent unscrupulous dealings in animals affected with the disease. The federal government, through meat inspection in the abattoir, renders valuable assistance by detecting tuberculosis in animals and recording their place of origin. Such records also enable state authorities to avail themselves of the proper course to pursue in the prevention of a further spread of the disease and its eradication. Notwithstanding all that the municipal, state and federal measures contrive to accomplish, the chief factors in hastening the eradication of tuberculosis will be the proper hygienic measures carried out by the private owner.

A NEW WORLD RECORD FOR TOYON HOLSTEINS

Toyon Farm Association announces that Lady Aaggie Echo Hengerveld has completed her year's work with close to 1,200 pounds of butter from over 28,000 pounds of milk, thereby breaking the world's senior three year old milk and butter record. The previous butter record of 1,171.1 pounds was held by Jewel Pontiac Segis, and the previous milk record of 27,949.4 pounds was held by Eli Aaggie Fayne Johanna. Lady Aaggie's record has not yet been confirmed by the advanced registry office.

It is a matter of considerable satisfaction to Toyon Farm Association to have this world's record back in its herd. In 1917 its Ormsby Segis Marie held this record with 1,074.54 pounds of butter from 27,025.7 pounds of milk.

Lady Aaggie Echo Hengerveld unites the blood of great transmitting animals, being by a grandson of Aaggie Cornucopia Pauline Count and from a daughter of Sir Johanna Canary De Kol, the sire of Spring Brook Bess Burke 2d, the only cow in the world with three seven day records above 35 pounds in connection with three yearly records above 1,000 pounds of butter.

Bred along such high producing lines, it was only natural to expect a creditable performance from her, but to have her break a world's record under the conditions existing in this case shows her to be a remarkably persistent performer. Lady Aaggie was purchased several months after freshening from the A. E. Smith Company of Sumas, Washington. Unquestionably the long journey and the complete change of climate and environment had some effect on her total production. Any cow that can break a world's record under such conditions is a promising prospect for further and greater honors.

DECREASE IN CATTLE AND HOGS

A falling off in the numbers of cattle and hogs in the United States occurred during the first four months of this year, as compared with the like period last year, according to reports of special livestock reporters of the bureau of crop estimates, United States department of agriculture.

In the case of hogs the births during January, February, March and April were about ten per cent fewer than in the same months last year. The marketings have fallen off about 15 per cent; the farm slaughter was about the same in both seasons; but the deaths on farms this year are over 40 per cent heavier than last year to May 1. Taking into consideration both the births and the deaths (from all causes), it appears that there has been a relative reduction of about five per cent during the first four months of this year as compared with the trend during the first four months of last year.

The births of calves from January 1 to May 1 were about 22 per cent fewer this year than last year. The net disposition of cattle by marketings, farm slaughter and deaths was about nine per cent greater than last year; it appears that there has been a relative reduction of about six per cent in total number of cattle as compared with last year during the four months January 1 to May 1.

The De Laval Separator Works,
Poughkeepsie, New York.

The Factory Behind the

DE LAVAL MILKER

Wherever cows are milked, the name "De Laval" stands for quality and highest value to the user.

De Laval represents the utmost degree of service-to-user. The De Laval Company recognizes that when a sale is made, its obligation to the purchaser has just started.

These facts are important considerations when buying a mechanical milker.

The man who buys a De Laval Milker can ask for no stronger guarantee that it will give him the service claimed for it than the fact that it bears the name "De Laval."

The De Laval Milker is the only milker having an independent pulsation line, making possible alternating action at a fixed pulsation speed. It is uniform in action; and faster, more reliable, and more sanitary, than any other method of milking.

July 29, Conejo Ranch, Newbury Park.
July 28, Winsor Ranch at Los Angeles.

Hampshires
July 30, Conejo Ranch, Newbury Park.

Poland Chinas
August 21, Merced County Poland China Breeders' Association, Merced.
September 27, Hugh C. Shinn, A. J. Elliott and Alex D. McCarty, Tulare.
October 6, Kings Co. Poland China Breeders Assoc., Hanford.

Shropshire Sheep
August 11, Butte City Ranch.

Berkshires
August 11, Butte City Ranch.
August 14, Southwestern Berkshire Congress, D. J. Bastanchury Ranch, La Habra.

J. I. Thompson, manager of the C. Harold Hopkins farm, Davis, has recently purchased from Senator B. F. Rush, Suisun, the five year old red Shorthorn cow, Village Pride 2d. This cow is a daughter of Villager Omega, one of the good sons of the noted sire, Villager, and is out of a Queen of Beauty dam.

J. H. Rosseter of San Francisco has just sold his great two year old thoroughbred colt, Inchape, to Samuel C. Hildreth for the record price of \$125,000. Inchape is a son of Friar Rock-Rose of Gold and was bred in this state. He has started twice this year and his showing has been such that he is regarded as one of the greatest prospects of recent years.

Harvey M. Berglund of Dixon has decided to postpone the sale of Durocs that he had planned to hold during the early part of September. The sale will not be held until early next winter. In the meantime Berglund is busy fitting a herd for the fall shows.

Hollow Hill Farm, Colton, whose livestock management is now in the hands of B. W. Shaper, is to be made headquarters for top Durocs. A recent acquisition is the ten months boar by Mammoth Sensation, dam by King of Orions. For further foundation blood Mr. Shaper is to have an Ace of Pathfinder litter and likewise a Winsor's Giant Orion litter. Here of course is one of the oldest established herds of Guernsey cattle on the Pacific Coast. The 12 year old cow Caroline of Chilmark 24812 has just now dropped her

tenth calf, eight of them being heifers. One of her bulls is reserved for herd service. She has a record of 15,156.2 pounds milk in one year and 722.2 pounds of butterfat.

It is quite probable that Shorthorn exhibitors at the fall shows will again have to reckon with last year's sensational champion, Little Sweetheart, shown by T. S. Glide, Davis. She now has a lusty calf at side and herdsman Robertson has done a remarkable job of carrying her through. A number of competent judges have pronounced her better than at the same time last year. Glide will have out a full herd which in several ways will be considerably stronger than his 1919 string.

H. M. Barngrover, Santa Clara, has just sold the yearling Hereford bull, Edgewood 5th, by Patrician 5th, dam, Catharine; also two choice two year old heifers, Miss Tempter 21st, by Beau Tempter, and Miss Perfect 11th, by Don Perfect, to T. L. Raney of Toll House. Mr. Raney has recently joined the Hereford ranks. This is the fourth son of Patrician 5th to go to head registered herds.

E. C. Stone, secretary of the American Hampshire Swine Record Association, Peoria, Illinois, advises us that he is sending his assistant, E. M. Harsch, on a 15 day tour of California in the interests of the association. Mr. Harsch comes highly recommended as a man of wide experience in publicity work in the Hampshire field. His plans are arranged so that he will be present on Hampshire day at Conejo Ranch, July 30, where he will be glad to meet swine breeders.

W. W. Van Pelt, secretary of the Southern California Fair at Riverside, is quite jubilant as to prospects for all lines of exhibits for the big 1920 show. Some of the more notable improvements in the livestock section at the fair grounds are the widening of the horse barns, together with a roof elevation, concrete floors, wide alleyway in center, and realignment of stalls. Fred Hall as superintendent of horses is to be credited with working out this improvement. Superintendent Langdon of the swine section has secured ample show room under cover and has a new lineup of the pens. In the cattle department Geo. W. Thomas has everything coming his way just right.

The Conejo Ranch two days' sale catalogue on its front cover presents a scene of rural contentment, comfort and beauty that is another way of extending the glad hand of welcome to all visitors on this red letter occasion. The strong pedigrees presented are backed up by the high quality of the animals offered. Under the head of "General Information" this catalogue presents a brief statement covering every feature in which the prospective buying public may be interested. Sale at Conejo Ranch, July 29 and 30.

F. L. Hall of Perris has a fine bunch of purebred Percheron colts at his Rosecrest Farm this year. Hall believes there is a future for the big drafter. Percherons, Shorthorns and Berkshires are favorites at Rosecrest. The usual fall fair exhibits from this ranch will be met with this year.

In building up his big type herd of Poland Chinas at Arlington Mr. H. Christianson has used three outstanding big boars, Long Smooth Jumbo, President's Model and Tourist Master, the last named boar being a fine son of the noted Iowa boar Black Master of Jumbo bloodlines. President's Model is a very excellent son of King's Big Bone Leader, of grand championship fame. A fine line of this boar's get are to be seen in this year's crop of pigs. He will be seen at the fairs if not sold before that date. He will be a hard one to beat.

Burt Wilkinson of Falfadale Farms, Perris, is found to be strictly on the job with the big Durocs again this year. The big boar Great Orion Sensation Jr. is likely to develop a reputation as sire of the up-to-date type of Durocs as the show season progresses. There are some out-and-out good prospects in the spring litters, and in numbers to surprise visitors at that. Wilkinson will be willing to let the public see this line of young stuff at its best about fair time for the reason that along about February there will be

Third Annual Sale BUTTE CITY RANCH

Owned by W. P. Dwyer and W. S. Guilford

Butte City, Cal., Wednesday, August 11, 1920

60 Registered Shorthorn Cattle
20 Registered Berkshire Hogs

105 Registered Shropshire Sheep
10 Shetland Ponies

25 of the Registered Shorthorns are consigned by O. L. Raper, Glenn, Cal.
owner of the well known sire, Crescent Dale

THE SHORTHORNS—Will include about 15 good cows with calves at foot, all of breeding age in calf to Victor Stamford, Herman the Great, or Crescent Dale. The offering includes daughters of Hallwood Flash, Vermillion, Sir Type, Crescent Dale, Victor Stamford, Cedarlawn's Best, Victor Stamp, Count Glory, Hallwood Villager, and others of substantial and popular breeding. There will also be a most attractive lot of heifers, both bred and open, and a limited number of good young bulls.

THE SHROPSHIRE—Butte City Ranch has become justly famous for the quality of its registered Shropshires, a flock developed largely from foundation of Broughton, Wardwell and Cavendish breeding, and the present offering will consist of ram and ewe lambs, and breeding ewes that both breeders and beginners can use profitably.

THE BERKSHIRES—This looks like a most favorable time to buy good registered Berkshires, for it is the general opinion among many hog growers who watch developments carefully that prices have about reached the low point and advances may be looked for shortly. A splendid offering of young gilts and a very few boars will be made in this sale. Representing largely the famous Butte City Princess family.

THE SHETLAND PONIES—Everyone in ponydom knows the good quality of Butte City Ranch Shetlands, and many visitors at this sale will have an opportunity to see for the first time the famous show stallion General Boggs, now heading the Butte City stud. The pony offering will consist of 10 head of good ones to delight the hearts of the kiddies.

Sale Catalog Is Free on Request. Write for a Copy

Management

California Breeders Sales and Pedigree Company

J. M. Henderson, Pres.; C. L. Hughes, Sales Manager.

Auctioneers: Col. Ben A. Rhoades, Los Angeles; Col. Geo. W. Bell, Tulare

lined up a bred sow sale from Falfadale stock that is going to be an extremely interesting affair. Falfadale show herds will make the entire circuit.

Manager C. R. Thomas reports all preliminary work for the big Los Angeles Livestock Show to be strictly up to the minute. Speaking of the splendid prospects for an out-and-out fine horse show this year Mr. Thomas remarks that it "takes money to make the mare go," and they have got the money to do it. A purse of over \$7,000 in special prize money is quite a windfall when added to the regular cash prizes of the show. In addition to the large displays of pedigreed livestock in all departments there will be numerous special attractions in the way of steeple chases, running and driving races, as well as the society horse show at night.

On August 14 the Southwestern Berkshire Congress will hold a sale of purebred registered Berkshire sows and gilts on the D. J. Bastanchury Ranch, La Habra. This sale should prove decidedly interesting to the farmers and orchardists of Southern California as the animals to be sold come from some of the state's best herds and will be bred to boars that have already proven sires of recognized ability. Berkshires are celebrated for their ability to make satisfactory gains on most any kind of feeds and their ability to dress out with a very small percentage of loss. During the past year the demand for Berkshires has been greater than for a number of years preceding, and this is accounted for in part by their reasonableness in price and their prolificacy. It is a conceded fact among hog raisers that the Berkshire sow is not only prolific but is a good mother and will raise a large percentage of her pigs. Ben S. Rhoades of Los Angeles will be the auctioneer.

Segis Johanna De Kol of Edelweiss, a registered Holstein cow owned by John Saxer, Modesto, has completed official records of 31.68 pounds butter from 616.5 pounds milk in seven days, and 123.5 pounds butter from 2,326.9 pounds milk in 30 days. This is an exceptionally well balanced record, showing that desirable production of over 600 pounds milk along with the 30 pound butter record. Another member of the Saxer herd, Moorland Colantha Rose, going on test three months after calving, made 22.5 pounds butter from 529.5 pounds milk in seven days, also a well balanced record. Many breeders will be interested to note that the 31 pound cow mentioned above, Segis Johanna De Kol of Edelweiss, is a daughter of King Pontiac Netherland Segis, the herd sire formerly owned by Ernest Otto McClure, thus giving this sire two daughters above 30 pounds butter in seven days.

Vina Pietertje Hengerveld De Kol, owned by E. E. Freeman, Modesto, has now been on test 200 days and has to her credit 19,100 pounds milk and 750 pounds butter. She is going strong at present and promises easily to add another big record to the nice list made in this herd during the past year.

It is of interest to note who won the Holstein-Friesian Association of America prize money in the prize lists for production of milk and butter fat during the past year. California ranks fourth in the list of states as regards the number of prize winners, being below New York, Wisconsin and Michigan in the order named, all of which states have several times the number of registered Holsteins that California has. The California breeders and amounts of prize money won by them are as follows: Bridgeford Holstein Co., Patterson, \$295; W. J. Higdon, Tulare, \$259.50; E. E. Freeman, Modesto, \$255.25; Toyon Farm Association, San Francisco, \$236.75; A. W. Morris & Sons, Woodland, \$231; J. S. Gibson Co., Williams, \$108; H. E. Vogel, Fresno, \$65.50; Los Angeles County Farm, Hondo, \$54.25; Alex Whaley, Tulare, \$43.50; M. H. Tichenor, Palo Alto, \$42.50; Burr Farm, Los Angeles, \$35.75; Mrs. Annie Donders, Fresno, \$33; Bock Bros., Pacheco, \$32.50; Lee-man & Kilgore, Ripon, \$26.75; Fred Hartsook, Lankershim, \$20; E. D. Barry, Jr., Daggett, \$20; J. W. Benoit,

Modesto, \$20.25; Palo Alto Stock Farm, Palo Alto, \$14; G. M. Brown, Los Angeles, \$13; R. F. Guerin, Visalia, \$12; Gotshall & Magruder, Ripon, \$12; H. E. Cornwell, Modesto, \$11. Six other breeders won prizes from \$10 down to \$5. Rather the most remarkable feature of the California list of winners is the showing made by E. E. Freeman, Modesto, who

ranks third in the list in amount of money won. His herd is only a very small one in comparison with the other principal prize winners, and the records made in the herd last year place it among the best in the country regardless of size.

V. F. Dolcini, Davis, reports that his junior yearling Duroc boar, Choice

Wonder 3d, is developing in splendid form and that he will be ready for the state fair. Choice Wonder 3d is a boar of great size and scale, smooth and extremely mellow. Dolcini is not making any claims, but he seems to feel that the boar that beats him will be the grand champion.

Two-Day Auction

Famous Conejo Ranch

Registered Duroc-Jersey and Hampshire Herds

Thursday, July 29th---Duroc-Jersey Sale
Friday, July 30th---Hampshire Sale

For years the Conejo Ranch has been recognized for the high-class pure bred hogs in both Duroc-Jersey and Hampshire breeds that it has raised. At every stock show for the past few years, Conejo animals have been prominent in the championship and first-prize classes. Every year the standard of the Conejo hogs has been raised, with the result that this ranch today is able to offer a remarkable big type, preferred by all breeders.

Be Sure to Attend

For the first time Conejo Ranch hogs will be offered at public sale. The offerings in both classes will be carefully selected bred gilts and a few tried sows—the kind that make valuable foundation stock for farmers, fancy breeders and pork producers. Make arrangements to take in this sale. Lunch will be served at the ranch.

Giant Wonder

Conejo Prince

Great Breeding

The bred sows and gilts in the offering are bred to our famous herd boars:

A HEREFORD JOURNEY

Over the Fourth of July holidays it was my pleasure to accompany H. M. Barngrover, together with Wm. Briggs of Dixon, Alec McDonald of Davis and Mr. Raney of Toll House, all interested in Hereford cattle, to Mr. Barngrover's mountain ranch, Veramont Stock Farm, located in one of the prettiest mountain valleys of the Sierras, the Indian Valley of Plumas County.

We left Davis at eight o'clock Saturday morning and after a delightful trip over wonderfully smooth mountain roads and through the famed scenery of the Feather River country, found ourselves, before sundown, at Veramont Farm near Taylorville in Indian Valley. To all of us, accustomed to the heat and dryness of summer in the Sacramento and San Joaquin Valleys, the intense green of the mountain meadows, rank with the luxuriant growth of the native grasses, with aspen lined streams flowing through them, and skirted by the pine covered mountains of the Plumas forest, was indeed a revelation and a pleasure, and I dare say there was not one of us but, if he could, would have fain transplanted this scene to his own locality.

Veramont Farm consists of some 800 acres, something over 400 being of this rich meadow land in an arm of the Indian Valley. On these meadows the native grasses, alsike and white clover, supplemented with alfalfa and timothy, grow luxuriantly, and it is no wonder, with such feed in abundance, that local cattlemen claim that they can grow larger and better cattle here than elsewhere.

Mr. Barngrover's ranch is well stocked with a nicely selected herd of registered Hereford cattle. Under the guidance of Herdsman Harry Wilson we were conducted through the pastures and paddocks, and the various individuals topping the herd were pointed out to us. Mr. Barngrover has been using for several years a smooth, thickset bull, Patrician 5th, a grandson of Paragon 12th, and he has surely left his imprint on the herd. In addition to Patrician 5th, Mr. Barngrover is putting into service a two year old bull, Don Woodford, a son of Woodford 1st, a bull of great scale and wonderful quality for an animal of his size. His use will certainly increase the average size of the individuals in the herd. We were also shown some promising herd bull prospects, together with the animals in fitting for the fall shows.

After a pleasant half day looking over the ranch and cattle we made the return trip over the summit of the Sierras, through the Sierra Valley to Truckee, and home by way of Lake Tahoe, concluding an exceedingly pleasant and interesting three days jaunt.—H. H. Gable, Esparto.

THE BERKSHIRE AS A FARMER'S HOG

By Bruce S. Bennett

A buyer for one of the large Chicago commission firms remarked the other day that the "heavy lard hog" has seen his day. The reason ascribed was the many substitutes now on the market for lard. It would appear therefore that the hog to top the market should weigh from 200 to 225 pounds.

It is quite significant in view of the above to note the qualities of some Berkshire hogs killed in April. They had received no special attention and were the culls at one of the agricultural colleges in the Middle West. The killing reports on the five head read as follows:

Live Weight	Warm Dress	Cold Dress
Lbs.	Per Cent	Per Cent
225	86 2/3	84 4/9
194	89	86
154	89.90	87.6
250	86	84
185	83	81.6
Average	86.71	85

These dressing percentages are all the more striking in view of the fact that the hogs had been handled in the natural way with no attempt made to shrink them. They had been given a full feed in the morning and weighed soon after. This would appear rather conclusive proof that the Berkshire can be relied upon to dress out a high per cent of edible meat.

Therefore it is apparent why the Berkshire breeders claim that the Berkshire is a profitable farmer's hog. The sows are prolific and, what is of

greater importance, raise their pigs. The bacon is nicely striped with lean and the ham is solid and nicely marbled with only a small amount of fat. The Berkshire will at six to seven months reach 200 pounds and can be fattened on most any kind of feed.

VIEWS OF AN INNOCENT BY- STANDER

I saw an article in our paper, June 26, entitled "The City Movement," which interested me very much and prompted me to write.

It is only too true that the farmers, one by one, are giving up their farms and leaving for the cities. Can you blame them?

About six weeks ago my father had a two year old steer ready for market. The meat market offered \$35 only and said that was all they could pay, delivered. A neighbor boy bought the steer for \$37.50. After giving away the heart, liver, head, etc., and reserving the fat, he sold the meat at 17 cents straight and made a net profit of \$30.

The steer when dressed weighed little more than 400 pounds.

I am working in town and the cheapest of meat is not less than 35 cents per pound. How much excessive profits do the meat markets make? The city folks seem to think that the farmers are the only ones that are making anything and that they are getting rich. When they come out to work they expect the same wages they receive in town, board and room included.

Does it pay to raise grain (barley) at \$2.60 a hundredweight when labor is so unreasonably high?—\$2.60 now, threatening to drop even lower. Encouraging (?), isn't it?

The farmers almost have to mortgage their crops to pay the harvest hands. Where does the farmer come in?

I am not intending to "kick" the consumer—he has to face the H. C. L., which is indeed hard when there's a "middleman" between him and the producer. The farmer receives such a small sum for the cattle, hogs and other produce that it is a loss to him, while the consumer pays double and sometimes triple the price the farmer receives for the same article.—Reader.

IMMUNITY TO HOG CHOLERA LASTING

Immunity to hog cholera has been proved to be lasting. Pigs varying in ages from one to six weeks old were simultaneously inoculated and exposed to the disease during a period of from five to nine months. Without exception they were found to be immune to hog cholera.

No ill effects from the simultaneous inoculations were noted in the pigs and no difference was evidenced in the immunity of pigs from immune and nonimmune sows.

One week old pigs received ten c.c. of anti-hog cholera serum, together with one-half c.c. virus. Those ranging from three weeks or over received from 15 to 20 c.c. of serum and from one-half to three-fourths c.c. of virus.

In many cases when animals experimented with had attained weights exceeding 200 pounds immunity was tested by the injection of five c.c. of virus. No cholera resulted.

These experiments therefore prove that the simultaneous inoculation of young pigs is lasting and that immunity does not disappear at various stages of growth from weaning time until the animals have reached a weight of 50 to 60 pounds.—S. O'T.

CATTLE CREDITS

Cattlemen as well as sheepmen are hampered by the restriction of credit. Cattle loan companies have warned their borrowers to prepare to meet their obligations when due, and if this must be done there is only one way—to sell stock in excess of the normal numbers. That means the premature marketing of cows and calves which, with easier money, would be kept. The financial situation may have considerable to do with the numbers of cattle marketed before winter unless some relief is given to those who need credit.—National Stockman and Farmer.

California's land value is estimated to be \$3,875,000,000, and the population 3,575,000.

To Finance Wool Growers

The federal reserve board has restored confidence in the wool industry by suggesting a plan for financing the wool growers during the present emergency. By advance arrangement with the federal reserve board wool growers, bankers in the wool producing sections and Eastern wool markets, wool dealers, warehouse men, manufacturers and others interested in the wool trade held an all day session with the federal reserve board. The condition of the wool market caused by the recent cessation of purchases of raw wool was laid before the board and a full discussion was had of various plans for financing the industry until normal buying operations are resumed. Unlike most other crops, wool is marketed in the spring and early summer, and the marketing conditions prevailing during the past month have threatened great losses to wool growers, which might be disastrous. Such a condition, if it developed, might cause serious sacrifice of sheep on farm and range and result in reduced supplies of wool and mutton in future years. It was clearly shown that there was no disposition on the part of anyone to maintain artificial prices, but simply to make arrangements by which the temporary interruption of the wool market would be removed and normal marketing conditions restored.

The plan of action finally arrived at was adopted as a more simple and satisfactory way of dealing with the situation than the cotton loan plan of 1914 which had been suggested. At the termination of a conference between the board and a sub-committee consisting of bankers thoroughly familiar with the entire situation the

board authorized the following statement:

"A wool grower may ship his wool to one of the usual points of distribution, obtaining from the railroad a bill of lading for the shipment; the grower may then draw a draft against his bank for such an amount as may be agreed upon by the grower and the bank, secured by the bill of lading. The federal reserve act authorizes any member bank to accept a draft secured in this manner at the time of acceptance, provided that the draft matures in not more than six months from the time of acceptance. After acceptance such a draft bearing the endorsement of a member bank is eligible for rediscount or purchase by a federal reserve bank, provided that it has a maturity of not more than three months from the date of rediscount or purchase.

"It was suggested that the federal reserve board communicate with the federal reserve banks, pointing out that shipments of wool to points of distribution may properly be financed by acceptance in the above manner."

While the statement refers only to acceptances based on bills of lading, Governor Harding referred to the provisions of section 13 of the federal reserve act as to eligibility for discount of paper secured by warehouse receipts. At a later meeting of all interests concerned it was the unanimous opinion that the plan suggested above was practical and feasible and that no extraordinary difficulty would be encountered in the necessary financing to carry along the present season's wool clip until a normal buying market should reassert itself, which it was the firm belief of all would be within a very reasonable length of time.

Mules Needed on Southern Farms

"Good crops and high prices have brought wealth to the Southern farm in recent years," says D. W. Chittenden of the Missouri experiment station. "In consequence better grades of mules have been bought than formerly. The farmer is finding that the bigger, stronger mules, standing 15.3 hands and weighing from 1,200 to 1,250 pounds, will do his work enough better to pay him to buy that kind."

"But he isn't going to raise them. In the first place in some regions such as the coastal plain grass does not grow well. In other regions a very determined effort is made to keep out grass. The result is that in at least half, possibly two-thirds of the total area of Florida, Georgia, the Carolinas, Alabama and Mississippi pasture conditions do not exist.

"The South will not produce one-

tenth of its own work animals, in my opinion, so long as cotton and tobacco maintain their present high prices. Inasmuch as cash sales from an acre of tobacco in many instances exceed \$1,000 a year, and as such lands rent from \$150 to \$200 per acre per year it is hardly likely that any of it will go to pasture.

"Even the fertile and famous blue grass areas of Kentucky and Tennessee, which in the past have reared many magnificent horses, have yielded to the plow and been planted to tobacco and cotton, throwing all responsibility for a supply of work animals on Missouri, Kansas, Nebraska, Iowa and other horse and mule producing regions. The receipts of the St. Louis and Kansas City horse markets have been greater this year than ever before."

Hereford Breeders New Promotion Plan

A party of prominent Hereford breeders, who made a trip July 4 to the mountain ranch of H. M. Barngrover, were accompanied by Alec McDonald, who is in charge of the beef cattle herd maintained at the university farm, Davis. Now there is no denying the fact that the Hereford breeders of this state are very much alive. Indeed, they have a reputation for not overlooking any bets when there is a chance to extend the influence of their breed, but it remained for this party to put forth a new inducement to attract such a distinguished cattleman as McDonald to the fold of the Whitefaces. This canny Scotchman to date has successfully evaded any "entangling alliances," but there are those who "do say—" In full possession of the facts, the party set a trap for Alec by which they expect to kill two birds with one stone, or rather by which they expect to hasten the day when Alec signs up for life and at the same time becomes a Hereford owner. The daring Hereford owners have severally and jointly agreed to present Alec with one of the best Hereford heifers to be found in the state, if, on or before July 1, 1921, he has ceased to be a bachelor. Just now Alec is wavering between his love for single blessedness and Hereford cattle. No bets

are being placed as to who wins. In the meantime the Hereford breeders submit that no other breed association has adopted such progressive methods for extending their breed lines.

PIG CLUB WORK SPREADS

Six Duroc-Jersey sows were shipped into Cochise County, Arizona, two years ago to club members near Benson. The value to the community through the introduction of registered hogs is reflected through a letter from a Benson business man who writes the university agricultural extension service as follows:

"Kindly advise me by return mail price at which you can furnish a carload of sows similar to those shipped into the valley for pig club members."

The San Jose committee of cattle-men, after a long session with the executive and marketing committees of the California Cattlemen's Association in San Francisco, voted for the adoption of resolutions endorsing the association in urging an immediate renewal of the campaign to bring the association's membership to 100 per cent. It was agreed that two menacing factors in the beef market today were the slaughter of half fat cattle and diseased cattle.

Take Notice! Ye Big Type Poland Fanciers

We have 10 of these big yearling daughters of the old Grand Champion Superba safely bred for September and October litters to our big senior yearling boar Fortuna Bob, and these sows are for sale now. They will please and profit you. Act now.

Successful Dairy Meeting at Hanford

THE annual meeting of the California Dairy Council at Hanford July 14 and 15 proved to be one of the most successful dairy meetings held in this state in a long time. Nearly 2,000 interested dairymen, manufacturers and others were present. Secretary Greene had arranged a most excellent program, calculated to cover every phase of the dairy industry. Notwithstanding the fact that at the present time there is wide dissatisfaction over the state of af-

fairs facing the dairymen of California, there was slight indication of pessimism. As a matter of fact the attitude of the average progressive dairyman is one of determination to bring about a better situation largely through his own efforts. The dairymen realize that they can no longer expect to get by with old methods. Better bulls, better dairy practices, better marketing and a better understanding between all interested in the dairy business were stressed and made plain throughout the meeting.

C. L. Roadhouse, professor of dairy industry, University of California, had for his subject "Quality, the Greatest Factor in Increasing Consumption." Roadhouse declared that a wider use of milk and milk products was certain to develop as the consuming public came to a better appreciation of the importance of those products in the daily diet. He pointed out that while the future held the promise of a great demand for dairy products and it followed that the industry would get to a more stable basis, the dairy interests owe it to themselves and the public to produce those products on a quality basis. The public will then be willing to pay a fair price.

C. V. Castle, formerly with the University of California but now with the United States department of agriculture, spoke on the relation of production and consumption of dairy products to general agriculture.

E. F. Moran, attorney for the San Francisco Milk Dealers' Association, told the producers of some of the problems encountered in the city distribution of milk. Alfred McCann, assistant to the president of the National Dairy Council, told of the aims and purposes and accomplishments of the council. McCann urged the dairy interests to support both the state and national councils.

One of the most interesting addresses of the meeting came from Dr. Everett C. Beach, director of physical education for the Los Angeles city school department. Dr. Beach gave the results of the survey conducted some time ago among Los Angeles school children. He declared it was found that a large per cent of the children examined were not receiving milk in sufficient amounts. He further said that the lack of milk was not entirely confined to the children of the poorer sections. Dr. Ethel M. Waters, director of the bureau of child hygiene, California state board of health, further emphasized the place of milk in the diet.

Dr. Elwood Mead, professor of rural institutions, University of California, contributed an important address on "Planning Rural Development." Dr. Mead, who has been responsible for the success of the state land settlements, pointed out the part that dairying and other livestock activities must play in any permanent system of agriculture and made plain that the state, in the development of the Durham and Delhi colonies, recognized that fact and was encouraging in every way a wider use of livestock—and of good livestock.

The second day was featured by a big barbecue and an auction sale of bull calves. A Holstein calf donated to the dairy council by C. M. Blowers of Hanford brought \$200 from Denman and Hopkins of Sonoma. A calf from the A. B. Comfort herd was sold twice. The Sperry Flour Company paid \$250 for the youngster and then redonated him and he was sold again to the Shore Acres Dairy, San Leandro, for \$350. Wesley Clark of Hanford contributed a Holstein calf that was purchased by Denman and Hopkins for \$160.

One of the principal addresses of the second day was that of Dean H. E. Van Norman of the University farm school. Dean Van Norman discussed the present dairy situation and gave his opinions as to the probable future. He urged that dairymen improve their methods and put into practice the proven fact that better bred cattle can

and will make dairying more profitable. Van Norman pointed out that only through testing could one be sure of the cows that were really the profit makers. He also gave a demonstration of some of the more important points to keep in mind when selecting cattle for the dairy.

Dr. J. P. Iverson, chief of the animal industry division of the state board of agriculture, discussed the problem of bovine tuberculosis.

Other speakers were: Professor E. C. Voorhies of the college of agriculture; J. B. Lillard, state supervisor of agricultural instruction; Stanley B. Wilson, state board of education; J. R. Gallagher, Sonoma County farm bureau; Senator Silver of West Virginia, who represented the American Farm Bureau Federation, and Samuel H. Greene, secretary-manager of the California Dairy Council.

One of the most important steps taken at the meeting was the adoption of a resolution addressed to the board of regents of the University of California, asking that they make it possible for the university to secure at least two strong dairy experts for extension work. The dairy interests justly feel that the importance of their industry is sufficient to entitle them to the services of a strong corps of dairy experts.

The following men were elected to the board of directors: G. M. Brown, Los Angeles; Ed. H. Webster, El Centro; E. M. Dorman, Los Angeles; F. A. Robb, San Francisco; W. B. Hopkins, Petaluma; J. H. Guinn, Petaluma, and W. T. Wilson, Fresno.

The council is planning to hold similar meetings at various dairy centers throughout the state and it is probable that at least four meetings a year will be arranged for.

THE HOLSTEIN RECORD

The Holstein-Friesian cow Lady Aaggie Echo Hengerveld 323463 has broken the record for fat production in the senior three year class of the semi-official yearly division, by producing in 365 consecutive days 28,008 pounds milk containing 960.56 pounds fat. She freshened at the age of three years, seven months, 13 days. Her best seven days official production, made in the early part of the lactation period, is 684 pounds milk containing 25.49 pounds fat; while in 30 days she produced 2,894.2 pounds milk containing 97.268 pounds fat. During an official test, beginning 255 days from freshening, she produced in the division covering tests begun not less than 240 days from freshening 494.4 pounds milk containing 19.753 pounds fat. Her sire is Paul Aaggie Oakhurst 55387; her dam is Lady Echo Hengerveld De Kol 2d 159461. She was bred by Albert E. Smith, Sumas, Washington, and she is now owned by the Toyon Farm Association, San Francisco. In the senior three year class of the yearly division she displaces Jewel Pontiac Segis 229261, whose record for 365 days is 27,068.5 pounds milk containing 936.92 pounds fat. Computed on the 80 per cent basis, the equivalent butter claimed for Lady Aaggie Echo Hengerveld amounts to 1,200.7 pounds.

THE SILO

"The silo is a well know institution and is rapidly becoming popular with most Hoosier farmers, yet there are probably a few benighted individuals stuck here and there in the far corners of the state who are unfamiliar with its appearance and its virtues," suggests the Indiana Farmers Guide. "To such as these we commend the following description, written by a man in Colorado who styles himself Farmer Putnam:

"A silo is a hole, entirely surrounded by a wall, fur storin' cow feed. Sometimes the hole is in the ground; sometimes it is up in the air. To build a silo, first select a nice spot fur the hole, then build a wall outside of the hole, if you want to build up, or inside of the hole if you want a pit silo. Either kind is good, but you got to go about it different. If you can't put up a silo, put one down, but don't put it off.

"All kinds of material is good for silo buildin' exceptin' hot air. Good ones is made outen cement, concrete, cement staves, or slabs, holler tile, brick, stone, wooden staves, steel or two by fours. Most of the farmers has got the spot fur the hole picked out, but they hain't never begun to commence to build yet, fur some rea-

sons or others. Some hain't got the money, some cain't decide on the kind of silo, some sez it's too much work to haul the crop in and cut it up, some sez it makes the cows' teeth fall out, some sez it gives them holler horn and holler tail, some sez it makes the milk turn green, some sez the butter from the silage milk won't churn, some sez it makes steers scour, hawgs howl, and lambs limp. Anything to put off silo buildin'. I'm tellin' you folks better get busy and look into this silo business! It'll mean money fur farmers that wants to make beef, mutton or milk, and I know o some that feeds it to hawgs and lots of it is fed to hosses and mules. I wouldn't starve on it myself if I had to eat some good corn silage."

"The above sizes the situation up just about right. It is easier for some men to put things off than to get to work and do them. Procrastination has probably robbed Indiana farms of more silos than any other one thing. But now is the accepted time. As Putnam says, 'Better get busy.'"

HOLSTEINS POPULAR

The L. E. Prestage Holstein dispersion sale, held at his ranch near Porterville, June 24, was well attended and quite successful, but a number of local farmers were prevented from attending the sale on account of the rush in the harvest fields at this time, and many of the cows went for less than they are really worth.

Noticeable in the crowd were a number of men who only a few years ago failed to appreciate the difference between ordinary scrub cows and pure bred stock, but the good work being done by agricultural journals and farm bureaus is having its effect and farmers are gradually culling out the scrubs and breeding up their herds, whether of beef or dairy cattle.

Mr. Buttels of Wasco was a heavy buyer, Prince Coloma Segis, a two year old bull, going to head his herd at near \$1,500, and men who know stock speak highly of his merit. Mr. Buttels already has a good herd, and among other additions to it from the Prestage sale might be mentioned Butterfly Fairy, an especially good cow of proven worth, and Stratford Ruth Riverside, also a fine individual. These two represent an investment of about \$1,000.

A two year old bull, Segis Pontiac Butterfly De Kol, brought \$580, being added to the Sturgeon herd at Tulare. Another choice cow, Wayne Hengerveld Ornot, was taken by Joe Weisenberger of Poplar.

Jay Hayes; Mr. Kennon and others of the Porterville section selected choice individuals.

Mr. Prestage's son, E. L. Prestage, is keeping six of the best calves, two of them being daughters of Butterfly Fairy and Stratford Ruth Riverside.

FARM BUREAU FAT HOG SALES

Recent California farm bureau marketing sales of fat hogs have made very creditable showing in amounts received for San Joaquin Valley stock. The sale at Visalia on July 13 showed one lot of 68 hogs averaging 170 pounds commanding \$16.60; another lot of 79 averaging 181 pounds, \$17; one lot of only six hogs averaging 126 pounds netted \$15.75; two other lots sold for \$14.60 and \$12.45.

At the Tulare sale, same date, the high figure was for 200 pounders, which brought \$17.10, and the low figure for 300 pounders, \$13.95.

The Hanford sale on July 15 brought together 216 hogs. The highest price of the day was \$17.85 for 85 200 pounders. Another lot of 21 weighing 129 pounds netted \$17.75. One other lot of 56 hogs weighing 175 pounds brought \$17.25. The low price of the day was for a lot of 14 averaging 407 pounds, which brought \$15.

The Corcoran sale, July 16, resulted in 63 hogs averaging 186 pounds selling for \$17.70. Others in the same sale commanded from \$15.25 to \$16.70.

WEIGHT OF CREAM AND MILK

Milk with a fat content of two and one-half per cent at 68 degrees temperature weighs, when skimmed, 8.63 pounds per gallon. A ten per cent butter fat content of mixed milk and cream weighs 8.53 pounds. As a general rule, milk from three to five per cent butter fat weighs approximately 8.6 pounds per gallon.

Livestock News Notes

Other Livestock News Notes on Pages 106 and 107.

One of the first big sales of the fall season will be that of the Butte City Ranch, Butte City. The sale will consist of 60 head of registered Short-horns, including a goodly number of cows and helpers as well as a few young bulls. Part of the cattle will come from the recently established herd of O. L. Raper, Glenn. It will be remembered that Raper was the buyer last year of the bull, Crescent Dale. There will also be offered 100 head of Shropshire sheep that are said to be of a very high order. As usual about 40 head of Berkshires will be included and 20 head of Shetland ponies. The owners of the Butte City Ranch, Messrs. Dwyer and Gullford, last year adopted the policy of disposing of most of their annual productions in an August sale. The first sale was one of the most largely attended in the state and plans are being made to accommodate even a greater crowd this year. The event will be held August 11 and will be managed by C. L. Hughes of the California Breeders' Sales and Pedigree Co. Cols. Rhoades and Bell will be the auctioneers.

Mrs. E. A. Hardy, manager of the Anchorage Farm, Orland, has received word from Sycamore Farms, Pennsylvania, that Anchorage Star 29th has been selected for the view herd of Berkshires now on the way to South America. Anchorage Star 29th is a daughter of Star Leader and was purchased by Sycamore Farm two years ago. Recent sales from Anchorage Farm include a gilt carrying the service of last year's champion, Natomas Baron Duke, to E. F. Batten, Hood River, Oregon, and one to the Oregon agricultural college.

Mills Orchard Co., Hamilton City, has announced arrangements with Charles M. Talmadge of Salem, Oregon, to take over the management of its large herd of Berkshires. Talmadge, who is a director of the American Berkshire Association, is one of the best known Berkshire men in the country. For a number of years he was the owner of Silver Birch Farms and a breeder of Berkshires and Jerseys. The announced arrangements are expected to have an important bearing on the Berkshire industry of this state.

Dan Beeman, Holstein breeder of Woodland, has the honor of making the first livestock entry for the coming state fair. This will be Beeman's first show, too, and he has entered his three year old bull, Dean Fayne Segis, the aged cow, Johanna Hengerveld Capunna, and four young things.

H. A. Johansen, who breeds Poland Chinas on his ranch near Fresno, writes that he expects to show his junior yearling boar, Victory Bob, a son of last year's champion, Giant Bob. On June 16 he weighed 476 pounds, measured 68 inches long and stood over 37 inches high. Johansen will also enter a futurity litter.

J. H. Cook, Poland China breeder, writes that he has recently secured a ranch near Chico and has moved his herd from his former location at Paradise. Cook says that he has plenty of alfalfa and plans to increase the size of his herd very materially during the next few months.

W. M. Bray, Klamath Falls, Oregon, will disperse his entire herd of high class registered Holsteins at public auction, state fair grounds, Sacramento, on Thursday, August 26. The owner is an extensive lumber operator and had intended to build an elaborate breeding establishment at Klamath Falls but is called upon to develop a large operation in lumber in the East and must therefore sell the herd. The herd is headed by a son of the great Canadian cow, Zarilda Clothilde 3d De Kol, who is the only cow in the world besides Tilly Alcartra that has ever produced over 33,000 pounds of milk in one year, her records being 33,153.6 pounds milk and 1,194.17 pounds butter in 365 days. The sire of the herd bull is Aaggle Cornucopia Newman, head of the famous Colony Farms herd in Canada, he being a son of the former world's record milk cow Margie

Newman. Practically all of the females in the sale are bred to this royally bred bull, and he himself, with some of his young daughters, will be sold. C. L. Hughes, sales manager of California Breeders Sales and Pedigree Company, Sacramento, who will manage the sale, has just returned from Klamath Falls and states that this herd contains an unusually high class lot of individuals, including a considerable number of granddaughters of Margie Newman, also granddaughters of King of the Pontiacs and other well known transmitting sires and dams. The herd contains 50 head, of which 47 are females, with official records up to over 31 pounds butter in seven days and out of dams with records up to over 32 pounds butter

FAIR DATES

Sonoma County Fair, Santa Rosa, August 25-29. Secretary J. Francis O'Connor.
Patterson Fair, Patterson, August 26-28. Secretary T. J. Moe.
California State Fair, Sacramento, September 4-12. Secretary Chas. W. Palne.
Tulare County Livestock and Agricultural Show, Tulare, September 14-18. Secretary John A. Rollins.
San Fernando Valley Fair and Market, Owensmouth, September 15-18. Secretary Chas. L. Schufeldt.
Kings County Fair, Hanford, September 21-25. Secretary Frank C. Russell.
Ventura County Fair, Ventura, September 22-25. Secretary L. P. Hathaway.
Glenn County Livestock and Agricultural Association, Orland, September 27-October 2. Secretary E. A. Kirk.
Fresno District Fair, Fresno, September 28-October 2. Secretary Walter C. Ficklin.
Los Angeles Livestock Show, Los Angeles, October 2-10. Secretary C. R. Thomas.
Siskiyou County Fair, Yreka, October 5-9. Secretary Claude R. Gillis.
Southern California Fair, Riverside, October 13-19. Secretary W. W. Van Pelt.
Western Royal Livestock Show, Spokane, Washington, November 1-5. Secretary Bert L. Hilborn.
Pacific International Livestock Show, Portland, Oregon, November 15-19.

in seven days. The herd has passed two federal tuberculin tests without a reactor, and every female of breeding age except one has a calf dropped this year in the sale.

The agricultural and livestock exhibit at the Southern California Fair, which will be held at Riverside, October 13 to 19, will be a distinctive feature again this year. A tent 102 by 300 feet will be used for an exclusive agricultural and horticultural display. There will be nothing else in this big tent. Every community in Riverside County will have a display this year, which means that double the space will be used this year in the exclusively Riverside County display. There will also be more than double this space used in county displays as seven counties outside of Riverside County have indicated their intention of displaying their products.

MINERAL MIXTURES FOR WORMS IN HOGS

While the following remedy for worms in swine is not the most effective that can be administered, it may be fed without danger of poisoning, and the division of animal industry of the state department of agriculture recommends its use where parasitic eggs are numerous and the swine cannot be moved conveniently to non-infested areas; in such cases a remedy of this kind will prove quite efficacious; Pulverized charcoal, five pounds; air slaked lime, five pounds; hardwood ashes, five pounds; common salt, two and one-half pounds; sulphur, two and one-half pounds; pulverized sulphate of iron, one-half pound. Mix thoroughly and deposit in a dry place where pigs or hogs may have access to it.

California Lima Bean Growers Association recently held its annual meeting, listened to reports and elected new directors. C. C. Perkins was reelected president and W. H. Stiles, secretary.

Milk 365 Days 33153.6

Butter 365 Days 1194.17

is the only cow in the world besides Tilly Alcartra that has ever produced over 33,000 pounds milk in one year.

HER 5 YEAR OLD SON

sired by a son of the former world's record milk cow, Margie Newman, will be sold at public auction

State Fair Grounds, Sacramento, Cal.

Thursday, August 26, 1920

This offering is a complete dispersal of the choice herd of 50 registered Holsteins owned by W. M. Bray, Klamath Falls, Oregon, consisting of 47 females and 3 bulls, including one 7 year old cow with a record of over 31 lbs. butter in 7 days as a 4 year old, one four year old cow, and the balance all three year olds, two year olds, yearlings and calves.

TYPE—PRODUCTION—GOOD HEALTH

The type of the herd is unusually good, and the blood lines of the first rank. The herd has passed two Federal tests without a reactor, and every female of breeding age in the herd, except one, has a calf in the sale, dropped this year.

When Writing Advertisers Mention California Cultivator

CONDENSED

Buttermilk CONDITIONS CHICKENS

Supplying the food and tonic as it does in just the right proportions, LACTEIN is the conditioner of superiority.

And, our mere saying so does not make it such, but we are simply quoting what thousands of big poultry raisers tell us!

Pure buttermilk, processed and pasteurized, it keeps sweet in any climate—it furnishes a very high development of LACTIC ACID, so necessary to the organs and digestion of the fowls. And so economical in feeding—with tremendous results of benefit!

---and equally good for HOGS

LACTEIN CONDENSED BUTTERMILK is also of great value to the hog raiser. In the feeding of sows, the LACTIC ACID is most important in keeping the health and cleanliness of the sow's intestines—and it helps the sow produce more milk for its young. It is very beneficial for feeding weanlings—produces that health and tonic — which produces rapid, firm growth.

Just ask your dealer for Lactein today — let its economy be your investment of profit.

RHUBARB---Wagner's Giant Plant Now

July is one of the best months to plant. Growers who planted last July and August have already harvested over 15 tons per acre netting \$1,000 eleven months from planting. For further information write J. B. WAGNER, Rhubarb Specialist, 1550 East Villa St., Pasadena, California.

When writing advertisers, mention the Cultivator.

Summer Culling

By Jean A. Koethen

TWO kinds of culling are practiced by nearly all poultrymen. The first is what we might call general culling, which is practiced from the day the hatch leaves the egg till the old hens, worn out by long service, are sent to market. How many fall out by the way it would be hard to guess. Probably not a third of the pullets that enter on their laying career at six months or so live to a good old age. Some demonstrate their unfitness at the very start by delayed maturity; a few, even before maturity, exhibit defects of type or lack of vigor which make it evident they are better fitted for the pot than for the laying pen; others begin to lay promptly but lay undersized eggs for too long a period; still others make a fine start but stop to rest too soon. The careful poultryman notes the first symptom of unfitness and issues, without shrinking, the final mandate, "Off with her head!"

The second kind of culling is the special examination which is given in early summer to the pullets which have passed the general tests of winter and spring. If the pullets that began to lay promptly have been banded—that is, as many as could be detected—they will in most instances lead the class now. Early development is one of the best tests of vigor and fecundity.

"Long Distance" Laying

The heavy producer is the hen that lays longest before she molts. She must begin in good time and she must keep it up. As Professor Dougherty said at Van Nuys, a hen that has only 100 eggs to lay in a year can take her time about it. If she chooses to stop and molt in July there is nothing to hinder. She is not driven by her sense of much to be done and little time to do it in. The hen that has to lay 200 eggs by the end of her pullet year must delay the molt to do it, and so she lays on and on till November, perhaps till January. In nearly every heavy producing flock there are a few hens that have forgotten to molt at all in their first year. Ragged and disreputable looking, they concentrate on production. These are the hens to band for breeders, if breeders are wanted. If no breeding is done they may be profitable layers for several years.

The molting test is the most important and the easiest test in separating the layers from the boarders. Does a hen go into the molt in July? Off with her head. Does she begin to drop her feathers in August? To market with her. Has she stopped laying for any reason in June? The sooner she is eliminated the better.

Testing by Color

It is in May, June and July, when the hens are beginning to let up more or less in their laying, that the color test is applied. One poultryman I have met makes his first color test in May, a second in June and a third in July. Just as soon as the drop in production is noted the flock is gone over and the tint of shanks, vent, beak and earlobes noted. The hens which show decided yellow in shank and earlobe, pink around the vent, and a bright yellow color in the beak are the hens that have not been laying as heavily as they should. Just what is the grade of their deficiency is not so easily settled.

The theory is that a heavy layer lays the pigment out of her skin. The better the layer, the paler her color in early summer. At the university farm they are classified under three heads, pale, medium and yellow, but the boundary line between is one which it seems must be arbitrarily determined, that is, the hens with the palest shanks will be grouped together, as will those with the medium and those with the bright yellow shanks. Hens classified in this way at Davis showed a record of 160 eggs for the pale hens, 135 for the medium hens, and 129 for the bright yellow. There will in many cases be a difference in the degree of color in different portions of the body, and here is where the examiner must exercise discretion. He must, in fact, know his hens and consider every characteristic

before he can decide absolutely which hen to discard.

Here is the weakness of the color test. It is serviceable only for yellow legged birds and does not hold good for Leghorns with Minorca blood. Neither will it stand by itself as the molting test does. If a bird's shanks are yellow and her beak pale we must look farther before we decide. If shanks, beak, vent and earlobes are all pale, this may be sufficient proof of her fecundity. I use the word "may" deliberately because I doubt the efficacy of the color test by itself. There are too many "ifs" involved. Taken in connection with the molting test and the physical measurement test, it is a help and may serve to swing the balance one way or the other.

Pelvic Bones and Capacity

On the four Los Angeles County demonstration farms, whose records were very kindly loaned me by Mr. Eason, culling is done according to time of molting, the color test, and what is called "pelvic bone and body capacity." As these farms reached an average of 171.6 eggs per hen their methods are worth considering.

A great deal has been said about the pelvic bone test, and some have been inclined, perhaps, to give it greater weight than it deserved. It is based on the principle that the heavy layer must have pelvic bones so constructed that they permit ready passage of the egg. If they are stiff or curved in toward each other, they indicate either that the hen has not been a great layer or will not be—I am not quite sure which, for the two follow one another in a circle. If a pullet lays a great many eggs the pelvic bones become elastic and straightened from constant exercise, and the more elastic they become the more easily can she lay more eggs. Of this we may be sure, however, the greater the distance apart of the bones the more certain is it that the bird is laying heavily at the time of the examination, and it is fair to assume that a hen whose pelvic bones are stiff and close together in June, just at the close of the heavy producing period, cannot be a high producer. Thinness of pelvic bones at the beginning of the pullet year is held to be a reliable indication of the bird's capacity, since it is evident she is built on the right plan.

Distance from keel to pelvic bones is the backbone of the Hogan system of picking the layers. Whether it indicates anything more than abdominal capacity is a question which we need not discuss. Obviously, a great layer must have room for manufacturing eggs and for digesting the raw materials. A hen with a large abdomen has one qualification for production, whether she has any more or not. I noticed Professor Lloyd stressed the size of the abdomen rather than the distance from keel to pelvic bones. "In a heavy producer," he said, "the abdomen is large, full, soft and warm, and should just fit comfortably into the palm of the hand. If it is hard, it shows internal fat. If it is hard and puffy, as if filled with liquid, something is wrong."

Coordinate All Tests

The thoughtful poultryman will not be satisfied with any one of these tests. He will coordinate them all. The molting test is the surest. If a hen begins to molt in July, and if her shanks are a brighter yellow than is to be expected in a heavy layer, and if, on examination her abdomen is found to be hard and her pelvic bones stiff and not over two fingers' width apart, she may be condemned without probation. If in June a wilted comb indicates that any layer is no longer laying, and if examination reveals too yellow shanks, a too hard abdomen, and stiff pelvic bones, it is evident she is unprofitable.

Culling the commercial flock is a good deal like pruning a rose bush or thinning the peaches on your favorite tree—it is safer to let somebody else do it. The owner is almost sure to err on the side of leniency. If a hen is doubtful he gives her the benefit of the doubt.

The ideal is just in the opposite

direction. Sacrifice the innocent, if necessary, but let not a guilty hen escape. Sending a fair layer to market is not nearly so serious a matter as keeping a slacker in the flock. It is just because owners of good looking flocks have been too tender hearted to sacrifice a hen that might possibly pay her board that the average of production in California is 120 eggs or less instead of 150 eggs or over. It is better to own 500 producers than 1,500 loafers.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, June 28, 1920.

Report for week ending June 25:

The most prominent feature of the thirty-fourth week of the laying contest at Storrs is the fact that a pen of Rhode Island Reds owned by Pinecrest Orchards, Groton, Massachusetts, has relegated to second place a pen of Barred Rocks owned by Jules F. Francais, Westhampton Beach, Long Island. Jules F. Francais' Barred Rocks have been the leading pen in the contest for the past five weeks, but at no time during this period did they have a lead of more than 14 eggs on the pen of Reds from Groton.

With the oncoming of warm weather the removal of the male birds from the flock will be found advantageous in that it will not hinder egg production and the sterile eggs which the hens produce will keep much longer and will not deteriorate so quickly in transit.

The three best pens in each of the principal varieties are as follows:

Plymouth Rocks

Jules F. Francais (Barred), 1,428; Oneck Farm (Barred), 1,407; Merritt M. Clark (Barred), 1,333.

White Wyandottes

Mrs. R. W. Stevens, 1,216; Patrick F. Sullivan, 1,170; Applecrest Farm Co., 1,164.

Rhode Island Reds

Pinecrest Orchards, 1,441; Jacob E. Jansen, 1,275; Deer Brook Poultry Farm, 1,267.

White Leghorns

George Phillips, 1,360; Richard Allen, 1,351; E. A. Ballard, 1,342.

Miscellaneous

A. E. Hampton (Black Leghorns), 1,316; A. L. Anderson (R. I. Whites), 1,302; H. P. Cloyes (Buff Wyandottes), 1,190.

NATIONAL EGG LAYING CONTEST

By T. W. Noland

The 300 contest hens at the Missouri poultry experiment station at Mountain Grove laid 5,137 eggs during June, or an average of 17.12 eggs per bird. Pen S. C. White Leghorns, owned by Homer Collins, Ozark, Missouri, won the cup again by laying 119 eggs, making three months in succession that this pen has won the cup.

Ten Leading Pens for June

S. C. White Leghorns, Missouri, 119 eggs; S. C. White Leghorns, New Jersey, 118; S. C. Reds, Missouri, 117; S. C. White Leghorns, Missouri, 115; S. C. Anconas, Missouri, 112; R. C. Brown Leghorns, Kansas, 112; S. C. White Leghorns, England, 110; S. C. White Leghorns, Missouri, 108; S. C. Reds, Indiana, 106; S. C. Anconas, Missouri, 105; Barred Rocks, Missouri, 105; Black Minorcas, Missouri, 105.

Ten Leading Pens to Date

Barred Rocks, New York, 875 eggs; White Wyandottes, Missouri, 843; S. C. White Leghorns, England, 842; S. C. Reds, Missouri, 835; S. C. Reds, Alabama, 825; S. C. Reds, Missouri, 813; Barred Rocks, Canada, 805; Columbian Rocks, Missouri, 799; S. C. White Leghorns, Missouri, 780; S. C. White Leghorns, New Jersey, 779.

Five Leading Individuals to Date

S. C. Red, Missouri, 213 eggs; Barred Rock, New York, 204; S. C. White Leghorn, England, 194; S. C. Red, Alabama, 190; White Rock, Idaho, 188.

The Arizona Cattle Growers Association, together with committee from the State Wool Growers Association, has been urged by Arizona's governor not to oppose fair fees for leases on grazing land.

Poultry Queries

Conducted by J. A. Koethen

Soft Shells

Our Leghorn pullets hatched January 10 began laying at four months and eight days. Every morning I find one or two soft shelled eggs on the droppings board. They have oyster shell and gravel before them all the time, sprouted barley in the morning, wheat and kafir at night, dry mash in hoppers, all the green they will eat. Can you tell me how to keep them from laying these eggs?—Subscriber, Redlands.

When pullets begin laying so young they are quite likely to lay a good many soft shelled eggs. Your best course would be to put them on a conditioning mash consisting of 95 per cent bran and five per cent bone meal. This will check production and give them a chance to mature. If they had access to granite or limestone rock that might help, but maturity is the main thing.

Double Yolks

From 22 pullets we get some days four or five double yolked eggs. Can this be prevented? Which is the best commercial mash? They have quite different formulas. — Mrs. M., Redlands.

It may be your mash contains more yolk material than material for whites. In that case you could advantageously add bran. Most proprietary mashes are improved by adding from ten to 50 per cent of bran. I cannot say which one is best. They are all in general use and the formulas are changed so frequently that one does not know today what they may contain tomorrow. Some of our most successful poultrymen mix their own mashes according to the formulas sent out by the poultry division at Berkeley. A postal card will bring you the latest formulas recommended. Address: Poultry Division, College of Agriculture, Berkeley. A typical formula contains 6 quarts bran, 1 quart corn meal, 2 quarts ground barley, 1 quart alfalfa meal, 1 quart soy bean meal, 1 quart beef scrap, 1 pint coarse bone meal.

Diphtheritic Roup

A yellow scab forms in the throats of our chickens and chokes them. Can you tell me what to do?—Subscriber, Overton, Nevada.

This is diphtheritic roup, a disease very nearly akin to diphtheria in human beings, and sometimes called dipbtheria. Harrison and Streit advise burning out the membrane with hydrochloric acid (50 to 75 per cent) or silver-nitrate. Salmon recommends washing the throat with hydrogen peroxide, diluted one to three times with water. You would have to use this with a cotton swab. The following solution for a spray is recommended by Dr. Sanborn: Extract of witch-hazel, 4 tablespoons; liquid carbolic acid, 3 drops; water, 2 tablespoons. I should not spend very much time doctoring diphtheritic roup. Kill and bury deep, then clean up thoroughly, is the best prescription.

Barley for Turkeys

Can turkeys be raised successfully on barley stubble? Will the beards hurt them?—Subscriber, Gardena.

Barley stubble is all right. Some very successful turkey raisers feed barley as soon as the birds are ready for a general grain ration.

Intestinal Worms

My young pullets hatched in April and weighing only about two pounds are badly infested with intestinal

worms. In the bowels of a single fowl we find from one to three dozen worms about four inches long and the size of a broom straw. The chickens have an abundance of succulent greens daily, and I have fed ground pomegranate bark, but with no apparent effect. Can you suggest a sure remedy?—Subscriber, Los Angeles.

There seems to be nothing more certain than the remedy used at Davis and recommended by Dr. Beach, pathologist of the poultry division. This is tobacco dust, mixed with the dry mash in the proportion of one pound of dust to 50 pounds of mash. This is kept before the birds three weeks, and then no tobacco is given for three weeks. If the worms have not disappeared at the end of six weeks, the dose may be repeated. Dr. Beach claims that this will rid birds of worms even on infected ground, but it would certainly be safer to move them to clean ground.

Mischievous Chicks

My White Leghorn chicks six weeks old pick each other till they bleed. I think they would eat each other up if I did not remove the hurt one. I feed Suregrow mash, a buttermilk substitute, and wheat in the head.—Subscriber, Hemet.

It looks as if something were lacking in the ration. How much meat scrap does the mash contain? Chicks this age need a good deal of protein—20 per cent meat scrap is not too much. If you do not know just what the mash contains you might cook liver or some other cheap meat occasionally for the chicks or, better still, change to the laying mash. A mash that suits baby chicks is not strong enough for birds this age. Then I would feed some kind of corn, either cracked Indian corn or kafir or milo instead of the chick feed. Two grains are better than one. Wheat is all right but you need another grain with it. I know nothing about the buttermilk substitute you mention. It may contain protein and it may not. With a mash containing 20 per cent beef scrap, wheat and corn and plenty of green feed your birds ought to do well without buttermilk at this age. If you can get them out on range they will not have time to pick each other.

Emergency Solder

Hemet subscriber makes this suggestion for mending drinking pans in an emergency: Put in a little tar and hold close to the fire to melt. In a few minutes the hole is mended. This is useful when town is a long way off and the pan needed at once.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

The thirty-third week of the California farm bureau egg laying contest ends with D. B. Walls of Petaluma leading with a total of 1,496 eggs. B. F. Rose of Santa Cruz has taken second place from the Enterprise Poultry Ranch of Chino with a count of 1,436 against their 1,425. Hen number 16, belonging to D. B. Walls of Petaluma, is leading with a total of 199 eggs. Hen number 281, belonging to P. Pasquale of Inglewood, is a close second with 185 eggs.

For the past week the flock laid 1,354 eggs, a percentage of slightly over 57.

High pens for the week are: Bel-lows, 53 eggs; Stalling, 51; Gibson, 50; Gray, 49; Binney, 48; Gibson, 47; Peck, 46; Neef, 45; Schlink, 45; Brown, 45.

Poultrymen wishing to enter the next contest, which is scheduled to start October 1, should apply at an early date to the manager of the contest.

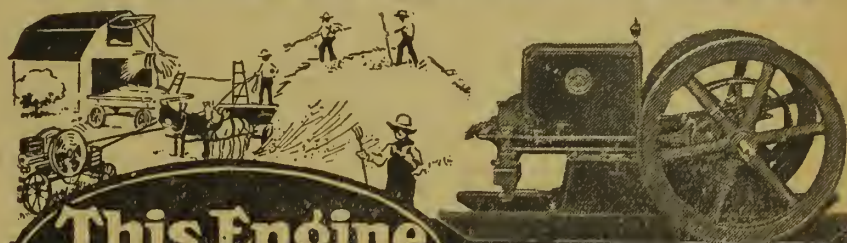

Dependable Power

Down to the last drop "Red Crown" is high grade gasoline. It is made to meet the requirements of your engine. Look for the "Red Crown" sign before you fill.

GOVERNMENT LAND

300,000,000 Acres Free Land in U. S.—Send for free descriptive circular of our 100 page book THE HOMESEAKER which tells you where this land is and how to acquire it, or send \$2.00 for book direct. The Homeseaker, Dept. M, 336 S. Broadway, Los Angeles, California.

LATE POTATOES SHOULD BE PLANTED LAST OF JULY

Potatoes intended for planting should be left scattered out in a shed to develop sprouts. About three weeks is long enough in warm weather. They should not be in direct sunlight. Seed should be soaked in corrosive sublimate for 1½ hours before sprouting. A 1 to 1,000 solution is advised. Formaldehyde may be used if used before any sprouts appear. It may kill sprouts if these are developed. The corrosive is not so severe. Potatoes should be planted during the last of this month.

KEROSENE EMULSION

Kerosene emulsion will destroy lice and their eggs on animals.

Dissolve by boiling about one-quarter of a pound of common laundry soap in one gallon of soft water. When the soap has all dissolved and the solution is still hot, pour into it two gallons of kerosene and stir the mixture vigorously. Take one part of the resulting creamy emulsion and add eight to ten parts of soft warm water. This can be used as a spray or applied by means of a stiff fibered brush.

Dr. C. C. Woodbury has been chosen as head of the conservation bureau of raw products recently established by the National Cannery Association at Washington, D. C. Dr. Woodbury has been for some years director of Purdue University agricultural experiment station at Lafayette, Indiana.

Southern California seems to be getting along fairly well as to dogs for it is reported there will be \$100,000 worth of them exhibited at the Southern California Fair.

CONCERNING OUR COLLEGE OF AGRICULTURE

(Continued from Page 99.)

raising, or experimental work. Most of these courses are given in the other colleges at Berkeley. If the college of agriculture were moved to Davis it would be necessary not only to provide buildings, equipment and staff to teach the many agricultural courses but also to teach the more numerous elementary and so-called cultural courses now given at Berkeley.

The training of the lawyer and doctor has been mentioned and compared with that of the farmer. Both the law and medical student spend a far longer time in elementary preparation before contact with the courts or medical practice than does the agricultural student. In fact neither of the former begins to get into anything like "practical work" in his university course until about the time the agricultural student is graduating.

The actual knowledge gained is not always the most important part of a college course. The really big things are the broadening of the viewpoint, the making of character, the training of the mind, giving one the ability to think out problems and arrive at definite conclusions, to distinguish between pure theory and good practice, etc.

These things are gained, not only by the studies pursued, but by the associations with fellow students and instructors. A college community such as that at Berkeley is very cosmopolitan, and much is learned from the daily contact with its men and women gathered together from all walks of life and all parts of the globe.

Mr. Wing's argument, supported by Mr. Royce, seems to be something like this: Send the college of agriculture student up to the farm at Davis for four years with the cows. This is exactly what should not be done, especially with the boy raised on the farm. He should be gotten entirely away from that for some time, then he will begin to appreciate it and be all the more anxious to get back. Why are the boys leaving the farms and going into the cities? Because to the boy raised on the farm it has been mostly drudgery, long hours, little freedom, and too intimate contact with the soil. Get him away from this for a while, and on returning home during his vacations he will begin to sit up and take notice. Having gotten some of the theory and scientific facts from laboratory and textbooks, he will begin applying them in practice. He will begin to see the beauties of nature and to appreciate the satisfaction of having produced something. He will begin to see the advantages of the independent life of the farmer, and these new ideas will overcome his old conceptions of drudgery. As a consequence he will return to college with greater enthusiasm for his work and a greater desire to return to the farm.

Of course this may not apply to the city boy, but his lack of farm experience is his misfortune and not the farm boy's fault. The bulk of the farmers will always come from the country, and not the cities, and the city boy will have to make up his lack of farm experience during vacations or some other time. If compelled to go to a college of agriculture at Davis, many farm boys would balk, but going to the University of California at Berkeley has a great appeal.

The college of agriculture is much more than an animal industry school, and all branches must be provided for. Following Mr. Wing's and Mr. Royce's argument, the citrus or subtropical fruit raiser might equally well argue that the college should be moved to Southern California where the student could get four years' practical training in the orchards.

My understanding of the reasons for founding the Davis school differ from that offered by Mr. Royce. It was realized that there should be an agricultural school for boys who had not gone to high school, and who when they realized the need for further studies, felt they were then too old to go. Hence the Davis farm school was founded, not as a protest against the type of instruction given at Berkeley, but primarily for these older boys who lacked the requirements to take the college agricultural course. I understand the Davis student averages several years older than the high school student.

It is now possible to spend three

semesters, or one and a half years, at Davis, beginning with the first half of the junior year. It also should not be overlooked that the student can and should get practical work and experience on the farms during the long summer vacations.

We all recognize the big handicap the college is working under in the lack of adequate funds for salaries and equipment, but this state would exist regardless of where the college was located. What is not so generally realized is the critical lack of land for agriculture at Berkeley. The college formerly had the use of the plot of ground west of Hilgard Hall. This consisted of several acres and was used for experimental purposes, both research and teaching. However, this plot has been taken by the military department for a drill ground so that now the college has practically no land for such purposes.

The following solution of the problem has been offered and seems to be an excellent one: First, restore this plot of ground to the college of agriculture to be used as formerly. If the military department needs more land for drilling it can be obtained by moving the athletic fields off the campus to some location in West Berkeley. This will raise a howl from the athletic adherents, but many Eastern colleges have their athletic fields off the campus and the same could be done at Berkeley. Second, acquire more land in the Berkeley hills to be used by the animal industry and forestry departments. This would enable the students following these subjects to get more practical instruction. Third, acquire a tract of agricultural land of at least 100 acres within an hour's ride of the campus. This would be used for experimental work, teaching and demonstrations of agricultural practice. These three suggestions, if carried out, would enable the students to get more of the practical training now felt to be lacking, and still the desirable features of the college at Berkeley would be retained.

No doubt objection will be made on account of the expense, largely by those not interested in agriculture, but the expense would be small compared with the benefits, and it would be much less costly than moving the entire college to Davis. The agricultural interests of the state should concern themselves in their college and if necessary force the adoption of some measures to remedy the present not entirely satisfactory conditions.

INDUSTRIAL RESEARCH LABORATORIES IN AMERICA

A bulletin just issued by the National Research Council lists more than 300 laboratories maintained by industrial concerns in America, in which fundamental scientific research is carried on. Industrial research laboratories have increased notably in number and activity, both in America and Great Britain, since the beginning of the war, because of the lesson vividly taught by the war emergency. It was only by a swift development of scientific processes that the Allies and America were able to put themselves in a position first to withstand and then to win a victory over Germany's science backed armies and submarines. And it is only by a similar and further development that America and the Allies can win over Germany in the economic war after the war, now being silently but vigorously waged.

CANARY ISLAND ONIONS

Onion seed, though a minor crop from the standpoint of total agricultural production, is of considerable interest to Texas onion growers, and from 80 to 90 per cent of the crop is exported to the United States. According to growing and exporting interests the production this year will be small.

Plantings last October for the crop to be harvested this summer were 50 per cent smaller than a year previous, owing to lack of contracts and the high prices of seed onions. Exports to the United States and Porto Rico in 1919 amounted to 72,000 pounds. The weather has so far been favorable, and should it continue so until June the yield should be proportionally though not actually larger than last year.

Fowler, Fresno County, reports its first ripe Thompsons shipped on July 8.

WATER HYACINTH IN CALIFORNIA

Ethelbert Johnson of the California department of agriculture has been investigating the water hyacinth situation in the state and reports:

"An interesting sequel to an article in the March Monthly Bulletin was the information from a number of reliable sources that the water hyacinth already was established in California. Investigation by the California department of agriculture, with the assistance of Commissioner Fred P. Roulard, disclosed an infestation of the pest in the Centerville bottoms in Fresno County, located in such a situation that in a season of floods it could be readily carried into the Kings River.

"The question arises, How did it get there? The only plausible theory is that it was either deliberately planted in the slough by someone enamored with the oddity of the plant and the beauty of its bloom, or that it was introduced into an aquarium, its growth becoming so rank that it was thrown out into the slough as trash. This is exactly the manner in which it is supposed to have been introduced into Florida and the Gulf states, where millions of dollars have been spent in ineffectual attempts to eradicate it.

"Its present growth gives every indication that it is well adapted to conditions in the San Joaquin Valley. Our florists tell us that it has been introduced into water gardens in all parts of the state for the past 30 years. There may be no harm in having the plant in an aquarium where it cannot possibly gain access to our streams, but we have no assurance that someone ignorant of its dangers may not again allow it to get into some of our waterways and canals on which the irrigated districts of the state depend. It may be well to follow the advice of Florida's plant commissioner and secure the immediate destruction of all water hyacinths in California. This is a fearful pest and California can better afford to expend a million dollars now in eradicating the thing than to have to put up with it for all time. It eventually will ruin the great majority of beautiful lakes and similar places in California, to say nothing of the damage that it will do in irrigation and drainage canals and in navigable waterways."

Reports from Douglas, Nogales and other sections in the south part of Arizona indicate that the range pastures are drying up to some extent and stock are losing weight. Along the upper Gila, however, the range is good and particularly favorable inasmuch as stock have access to the bottom lands which are irrigated to some extent. Throughout most of the state stock and ranges are in good shape and cattle and sheep are doing well.

Arizona stockmen have made complaint that the stockmen of Utah have polluted one of the streams rising in Utah and flowing into what is known as the "Arizona Strip," being that portion of Arizona lying north of the Grand Canyon. This matter is being threshed out by the attorneys general of the two states, with the possibility that it may be taken to the United States supreme court for final decision.

Census enumerators have just returned from a four months' trip in the north part of Arizona, taking a census of the Indians on the Navajo reservation. They find the number of Indians on the reservation to be 7,844, which is more than twice as many as had been estimated for this reservation. The Navajo reservation covers an area of 1,500,000 acres.

Additional power is to be developed from the Salt River project in Arizona. This power will develop about 5,000 kilowatts and will be used largely for pumping purposes. It is hoped by this that 100,000 acres additional will be brought under irrigation.

What is said to be the highest price ever paid for raw desert land in acreage tracts has just been paid for a full section south of the Salt River Valley of Arizona. The price was \$70,000. This was state land.

Swine growers are pleased at top prices of \$17.10, secured by California Farm Bureau Marketing Association at its recent Tulare sale.

The Cultivator Patterns

BE SURE TO SEND SIZE

3286. Bathing Suit—Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-48 inches bust measure. A Medium size will require 3 3/4 yards of 36 inch material. Price 10 cents.

3297. Girls' Dress—Cut in 4 sizes: 8, 10, 12 and 14 years. A 10 year size will require 3 3/4 yards of 40 inch material. Price 10 cents.

2770. A Simple Apron—Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42; and Extra Large, 44-48 inches bust measure. Size Medium requires 5 yards of 36 inch material. Price 10 cents.

3289. A Cool Dress—Cut in 5 sizes: 2, 4, 8, 8 and 10 years. A 6 year size will require 2 3/4 yards of 36 inch material. Price 10 cents.

3287. A Pretty Dress—Cut in 7 sizes: 34, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 2 3/4 yards of 27 inch material for the bodice and underwaist, and 5 1/2 yards for the skirt. The width of the skirt at its lower edge is 1 1/2 yard. Price 10 cents.

3300. Girls' Dress—Cut in 4 sizes: 8, 10, 12 and 14 years. A 10 year size will require 3 3/4 yards of 27 inch material for the bodice and 2 3/4 yards for the skirt. Price 10 cents.

3280. Ladies' House Dress—Cut in 7 sizes: 34, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size will require 6 3/4 yards of 36 inch material. The skirt measures 1 1/2 yard at its lower edge. Price 10 cents.

2815. Child's Play Suit—Cut in 5 sizes: 2, 3, 4, 5 and 6 years. Size 4 requires 1 1/2 yards for the waist and 2 3/4 yards for the rompers, of 27 inch material. Price 10 cents.

THE STUBBLE FIELD

By Anna Lenington Heath

The stubble field at daybreak
Wears many a dewy gem
Whose glowing, lustrous beauty
Would grace a diadem.

The stubble field at noontime
Is a field of the Cloth of Gold,
More royal far than France's mead
Where met two kings of old.

The stubble field at sunset
Glow in a wondrous light,
The glory of God lies on it
As softly comes the night.

CAST

THE auctioneer glanced at his book. "Number 29," he said, "black mare, aged, blind in near eye, otherwise sound."

The cold rain and the biting north-east wind did not add to the appearance of Number 29, as she stood, dejected, listless, with head drooping, in the center of the farmers and horse-dealers who were attending the sale of cast army horses. She looked as though she realized that her day had waned, and that the bright steel work, the soft well-greased leather, the snowy head rope and the shining curb were to be put aside for less noble trappings.

She had a curiously shaped white blaze, and I think it was that, added to the description of her blindness, which stirred my memory within me. I closed my eyes for a second and it all came back to me, the gun stuck in the mud, the men straining at the wheels, the shells bursting, the reek of high explosive, the two leaders lying dead on the road, and, above all, two gallant horses doing the work of four and pulling till you'd think their hearts would burst.

I stepped forward and, looking closer at the mare's neck, found what I had expected, a great scar. That settled it. I approached the auctioneer and asked permission to speak to the crowd for a few moments.

"Well," said he, "I'm supposed to do the talking here, you know."

"It won't do you any harm," I pleaded, "and it will give me a chance to pay off a big debt."

"Right," he said, smiling; "carry on."

"Gentlemen," I said, "about this time a year ago I was commanding a battery in France. It was during the bad days, and we were falling back with the Hun pressing hard upon us. My guns had been firing all the morning from a sunken road, when we got orders to limber up and get back to a rear position. We hadn't had a bad time till then, a few odd shells, but nothing that was meant especially for our benefit. And then, just as we were getting away, they spotted us, and a battery opened on us good and strong. By a mixture of good luck and great effort we'd got all the guns away but one, when a shell landed just in front of the leaders and knocked them both out with their driver; at the same time the gun was jerked off the road into a muddy ditch. Almost simultaneously another shell killed one of the wheelers, and there we were with one horse left to get the gun out of the ditch and along a road that was almost as bad as the ditch itself.

"It looked hopeless, and it was on the tip of my tongue to give orders to abandon the gun, when suddenly out of the blue there appeared on the bank above us a horse, looking unconcernedly down at us.

"In those days loose horses were straying all over the country, and I took this to be one from another battery which had come to us for company.

"I turned to one of the men. 'Catch that mare quick.'

"In a few minutes we had the harness off the dead wheeler and on the newcomer. Pull? Gentlemen, if you could have seen those two horses pull!

"We'd just got a move on the gun when another shell came and seemed to burst right on top of the strange mare. I heard a terrified squeal, and through the smoke I saw her stagger and with a mighty effort recover herself. I ran round and saw she'd been badly hit over the eye and had a great tearing gash in the neck. We never thought she could go on, but she pulled away just the same, with the blood

pouring off her, till finally we got the gun out and down the road to safety.

"I got knocked out a few minutes later, and from that day to this I've often wondered what had happened to the mare that had served us so gallantly. I know now. There she stands before you. I'd know her out of a thousand by the white blaze; and if there was a doubt there's her blind eye and the scar on her neck.

"That's all, gentlemen; but I'm going to ask the man who buys her to remember her story and to see that her last days are not too hard."

She fell at a good price to a splendid type of West Country farmer, and the auctioneer whispered to me, "I'm glad old Carey's got her. There's not a man in the county keeps his horses better."

"Old Carey" came up to me as we were moving off. "I had a son in France," he said, "in the gunners, too, but he hadn't the luck of the old mare"—he hesitated a moment and his old eyes looked steadily into mine—"for he'll never come back. The mare'll be all right, sir," he went on as he walked off, "easy work and full rations. I reckon she's earned them."—London Punch.

THE 300TH ANNIVERSARY OF AMERICA'S ORIGIN

THE year 1920 is doubly significant historically. It marks the 300th anniversary of two important events which led to the founding of the Republic of the United States of America. One is the signing of the Mayflower Compact and the landing of the Pilgrims, and the other is the meeting of the first American legislative assembly.

On November 11, 1620, in the cabin of the Mayflower, a tiny bark lying off the Massachusetts coast, a little band of liberty loving men from "Brittania" entered into what history has styled the Mayflower Compact. This agreement bound the 41 adult males in the ship's company into a civil body politic for the better ordering, preserving and furthering of their mutual ends. And it provided for such just and equal laws and offices as should be necessary for the general good of the colony.

Ten days later, so records Dr. Charles W. Eliot's inscription on the Pilgrim Memorial Monument at Provincetown, Massachusetts, "the Mayflower, carrying 102 passengers, men and women and children, cast anchor in this harbor 67 days from Plymouth, England.

"This body politic, established and maintained on this bleak and barren edge of a vast wilderness, a state without a king or a noble, a church without a bishop or a priest, a democratic commonwealth the members of which were straitly tied to all care of each other's good, and of the whole by every one.

"With long suffering devotion and sober resolution they illustrated for the first time in history the principles of civil and religious liberty and the practice of a genuine democracy."

Meantime, uninformed of the Pilgrims, fellow colonists of Captain John Smith had met at "James City" (Jamestown), Virginia, for the first American legislative assembly. On July 30, 1619, they had thus broken ground for the foundation of the present democratic form of government in the United States.

This year (in 1920) these events are being commemorated in the United States, in England and in Holland. In August, the origin of the Pilgrim movement will be celebrated in England. And early in September meetings will be held in Holland in memory of the Pilgrims' sojourn in that country.

In September a "second Mayflower" will set sail from Southampton, England, to follow to the American shore the path taken by the original Mayflower. (But this second Mayflower will be modern and therefore much more seaworthy than her smaller predecessor.)

This boat, carrying many prominent people of England, Holland and the United States, will anchor in Provincetown Harbor in late September. Its arrival will perhaps mark the crown-

80 Glasses From One Package

A package of Hires Household Extract—25c at your grocer's, a yeast cake and some sugar. These will make 40 pints or 80 glasses of the best rootbeer you ever tasted. And it's so easy to make.

The actual juices of roots, barks, herbs, berries—and pure cane sugar make Hires Household Extract pure and healthful.

ing dramatic episode of the entire Tercentenary celebrations.

These events will not be celebrated in the United States by the citizens of Massachusetts and Virginia alone, nor solely by the New England and South Atlantic states. Communities throughout America are planning to take this opportunity to review the "foundation upon which the United States rests," and to reemphasize those principles which these ancestors established, and which their sons, their followers and their followers' sons have handed down to us through our form of representative government.

America is appropriating from national and state treasuries hundreds of thousands of dollars to be used in plans for the commemoration. One plan is to erect, overlooking Plymouth Harbor, a colossal statue of Massasoit, the Indian chief who befriended the Puritan pioneer. Another is to set the Plymouth Rock, which in 1741 was raised above the tide, in its original position.

Seventy American cities, including New York, Chicago and Boston, have started plans for their celebrations of the Tercentenary. The Sulgrave Institution and the American Mayflower Council have been active in coordinating these plans.

THIS WEEK'S PATTERNS

Cool clothes for hot days! First and foremost comes an exceedingly pretty bathing dress that follows the lines of the present mode, with long wrinkled basque, like waist, sailor collar, short sleeves and Roman border on skirt which adds much to the appearance. In dark green wool or jersey it will seem first cousin to the cool green waves.

3287 is good style, "chic," as the style writers would put it, with the flat front effect and wideness at the hip which give the characteristic lines of the present mode.

The girls' dress, 3297, shows the same lines and in addition an added touch of quaintness that reminds of grandmother's little girl days. Made of a checked gingham or voile with white bands around neck, sleeves, and skirt pockets, embroidered in matching or contrasting colors, it would be original and individual. A very effective handling would be a gray check or plaid with bands of white embroidered in persimmon.

The little middy and skirt opposite are the thing for beach or mountain or vacation days at home, and then again for fall school days. White Indian head or duck are the most popular materials for this blouse, and blue serge or black and white check are almost always used for the skirt. Both of same material in navy blue Devonshire or similar heavy cotton would save washing and be always attractive.

Another good apron and house dress are shown in 2770 and 3280.

Two irresistible frocks for small folks, one for sister, one for brother, are pictured in 3289 and 2815. Yesterday we saw at the beach a quaint little frock on a dainty little girl, made on a model similar to 3289. The body material was of soft buffy yellow with lavender band around skirt, collar, belt, cuffs, collar and pockets outlined with heavy black cotton in a conventional braiding design. A pretty black Milan straw hat completed the picture. The small boy's jumper-bloomer-overalls combination in 2815 is so different and quaint that if one hasn't a small boy of one's own, one is apt to look about among one's acquaintances for just the right small boy to fit the little suit one's fingers are itching to make.

SEVEN POINTS IN CLOTHING THRIFT

How can the family or the individual best maintain the clothing standard demanded without spending more money or time than should be allowed? Marion Weller of the home economics division of the Minnesota state university offers the following suggestions which, when applied, should enable the consumer to answer the question:

First: Make a budget, or a plan for spending.

Second: Take stock of clothing on hand, especially of all garments that are worth remaking, repairing or cleaning.

Third: Learn some of the textile

facts that will help to make the buying of new fabrics more interesting. Learn also some of the simple textile tests that may be used in the home.

Fourth: Buy the fabrics that are more or less standard in quality and color. You will get the most for your money.

Fifth: Watch for and take advantage of special and out of season sales.

Sixth: Learn the best ways of taking care of clothing. Prolonging the life of clothing is one of the best means of conserving.

Seventh: Knowing how to sew is one of the most effective means of reducing the expense of clothing. If the mother of a family cannot sew, then the daughters should by all means learn.

If all the clothing of a family has to be purchased ready made, not only is there the added expense of making, but the material will not wear as well fabrics purchased by the yard for much less money. Buy only the dress or suit that is simple in style and of good material. If kept in repair it can, with only slight alterations, be worn several years.

WORTH READING

An expressman has been moved to write to the editor of Dumb Animals some common sense and humane advice for shippers of livestock:

"All through the winter I witnessed examples of cruelty to animals in transit. In most cases the shippers themselves were guilty. Half size crates and baskets were too often used to confine full size animals. Sometimes the station employees pitied the little animals enough to take time from their own duties to exercise them. It is certain they always gave vent to their feelings.

"Again, rabbits, puppies, etc., were continually sent from the Far West to New England. During the cold spell in February scores of valuable pets died in express offices or in the cars. Cold or hunger were given as the reasons. Is it not surprising that human beings will send a crate of rabbits from Colorado to Maine and not provide sufficient food for the trip? And then they wonder why 'Bunny' died!

"The express company does not provide food en route. When an animal travels a long distance and arrives safely it is because some rough, kind hearted workman gives it food from his own dinner pail. More than once I have contributed, and I'm not the only one.

"If this article is printed, it may strike the right nerve along the spine of a careless, ignorant shipper."

VALUABLE BREED

The minister delivered a sermon of but ten minutes duration—a most unusual effort for him.

At the conclusion of his remarks he explained: "I regret to inform you, brethren, that my dog this morning playfully ate the portion of my sermon that I have not delivered. Let us pray."

After the services a man who was a member of another church shook the preacher's hand heartily and said:

"Doctor, I should like to know whether that dog of yours has any pups. If so, I want to get one to give to our minister."

BOTH ARRIVED

A group of workmen were talking politics, when one of the disputants turned to a friend who had remained silent during the argument.

"I ain't a-goin' to say," said Bill doggedly. "Me and Hennerly Green thrashed it out once before."

"What did you arrive at?" asked the first.

"Well," said Bill, "Hennerly, 'e arrived at the 'ospital an' I arrived at the police station."

TEAM WORK

It ain't the guns or armaments, nor the funds that they can pay, But the close cooperation that makes them win the day;

It ain't the individual nor the army as a whole,

But the everlasting teamwork of every bloomin' soul.—Kipling.

Smoked, painted ceilings may be cleaned by washing with cloths wrung out of warm water in which soda has been dissolved

PUNK THOUGH PUNCTUATED

Would-be Contrib.—I don't see why you reject my story. Isn't it punctuated properly?

Editor—Oh, yes; but as far as I can see there isn't any other point to it.

NO TRICK AT ALL

"I am in a great hurry," said the bald headed man as he climbed into the barber's. "Can you cut my hair if I leave my collar on?"

"Sure," replied the barber, as he glanced at the shiny dome; "even if you leave your hat on."

ONLY THING HIS OWN

"I wonder will Smithers always allude to his wife so lovingly as 'my own'?"

"Well, she is his own. Everything else in his home he is paying for on the installment plan." — Pearson's Weekly.

IN CASE OF A BUMP

"Why did you turn out for that truck? According to the traffic rules you had the right of way."

"Yes," answered Mr. Chuggins, patiently. "But the truck had the right of weight."

NOT ALWAYS

"Talk is cheap."

"Is it? Well, you just try expressing your opinion of him to a policeman when he pinches you for speeding."

NOT GRATUITOUS

The meat, mostly bone, was thrown on the scales.

"Look here," remonstrated the man, "you're giving me a big piece of bone."

"Oh, no, I ain't," said the butcher blandly. "Yer payin' for it."—Scotsman.

"Thank you" often pays big dividends.

HE HAD IT

in honor of a visit to his plant by the governor of an Eastern state an automobile manufacturer once had a complete car assembled in something like seven minutes. Some weeks after this feat was heralded in the daily papers the phone at the factory rang vigorously.

"Is it true that you assembled a car in seven minutes at your factory?" the voice asked.

"Yes," came the reply. "Why?"

"Oh, nothing," said the calm inquirer, "only I've got the car."

Gold is valuable only because it is scarce.

Are You Taking Good Pictures?

If not let us tell you why. We are experts in photographic work of every kind and will give you prompt and careful service. We do enlarging and color work. Send us your roll. We will develop it, print the pictures and return them to you in the shortest possible time consistent with good service. We will help you to get the best results with your style of camera. Our stock of cameras and supplies is complete. We can furnish anything you need from the little box Brownie to the finished Graflex. Write us your wants.

Belgian hares, live, 13@17; old, 9.

LIVESTOCK

Los Angeles, July 20 — Weighed and delivered off cars without food or water: Hogs (hard-grain, 125 to 175 lbs., 15.50; 175 to 225 lbs., 16.50).

Cattle (on foot, gross weight): Steers, good, 8.50@9.00; medium, 8.00@8.50; cows, good, 8.00@8.50; medium, 7.50@8.00; bulls and stags, 6.00; calves, 125 to 150 lbs., 12.00; 175 to 225 lbs., 11.50.

Sheep—Ewes, 8.00@8.50; lambs, 11.50@12.00.

POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock, July 20, by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk. There may be slight fluctuations during the day's trading.

New stock: Supplies liberal, market steady: Local Early and White Rose, No. 1's, mostly 2.25@2.40; No. 2's, 1.00@1.50 per lug, according to size; 100 lbs., sacked, No. 1's, 5.75@6.00.

Carlots: Supplies liberal, market unsettled, sales to jobbers, new stock White Rose No. 1, sk. mostly 5.50@5.75; lug, 2.00@2.25.

Onions: New stock, Coachella Valley: Supplies practically exhausted. Stockton District: Yellows 1.50@1.75 per 100 lbs., sacked.

Carlots: Demand and movement slow, market steady. Sales to jobbers—Coachella Valley: Supplies practically exhausted. Stockton: Sk. Yellows 1.35@1.50; sk. Reds 1.25 per cwt. Garlic: lb., 20@25.

VEGETABLES

These are the actual prices obtained July 20 by the Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Beans: Ky. Wonder, 6@8; Limas 10@14 lb.

Beets: Doz., 35@45; sk., 2.25@2.50.

Cabbage: Supplies moderate, market strong, movement good, wide range in quality. Best mostly 3¼ per lb., per field crate, best 3.00@3.75.

Carlots: Supplies of shipping stock light. Demand good, movement limited, market steady, few sales. Carloads f. o. b. usual terms—Cannonball and Winningstadt, per ton, mixed cars, 50.00@55.00.

Carrots: Doz., 35@45; sk., 2.40@2.75.

Corn: Local, 75¢@1.25 per box.

Cucumbers: Market steady; local, best, lug, 60@80.

Egg Plant: Best, lb., 12@15.

Lettuce: Local, cr., best, 80@90.

Carlots: Supply moderate. Quality generally poor, market steady. Few sales mixed cars mostly 1.75 per crate.

Peas: Northern, lb., 9@12.

Spinach: Doz., 20@30; lb., 2.

Squash: Local summer, large lugs, 60@85.

Tomatoes: Imperial and Coachella, supplies liberal, market weak; cr., best, 1.60@1.90; local lugs, 1.50@2.25.

Turnips: Per dozen, 30@40; per sack, 1.00@1.25.

DECIDUOUS FRUITS

These are the actual prices obtained July 20 by the Los Angeles wholesalers in sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk.

Apricots: Local lugs, 1.50@1.85.

Bananas: lb., 10¢@11.

Blackberries: Supplies light, per crate, mostly 4.50@5.00.

Cantaloupes: Market weak, supplies moderate, quality and condition wide range. Imperial Valley: Standards, best 3.75@4.25; ponies mostly 3.50@3.75. Local: Quality and condition good; standards 4.00@4.50.

Carlots (Direct wire from Phoenix, Arizona): 26 cars shipped. Temperature past 24 hours—Maximum 110, minimum 80, clear. Hauling light, decreasing. Quality and condition generally good, some poorly netted. All consigned.

Cherries: Supplies moderate, market firm; various varieties, best, mostly 18@25 per lb.

Grapes: Thompson Seedless, lb., 14@15; Malaga, 12@14.

Peaches: Local, best, lug, 1.50@2.25; Northern, lb., 8¢@10.

Plums: lb., 7¢@10.

Raspberries: Cr., 4.50@5.00.

Strawberries: Cr., 4.50@5.25.

Watermelons: Supplies liberal; lb., 2@3.

CITRUS FRUITS

Grapefruit: California, per box, market pack, 2.25@2.75; special packed brands, 2.25@3.50.

Lemons: Market unsettled, wide range in prices. Local Stock: Packed, 3.50@4.00; loose, 1.25@2.25; lug, mostly 75.

Oranges: Supplies liberal, market firm. Valencias: packed special brands, 12¢@15.50@6.00; 150's and 170's 5.75@6.25. Local packed, second grade, 2.50@4.00. Packing house culls, 1.00@2.00 per lug.

HONEY

U. S. Bureau of Markets, July 16:

Moderate wire inquiry. Demand moderate, movement limited, market dull, little change in prices. Carloads f. o. b. usual terms: White Orange and White sage, 19@20; Light Amber Sage, 17½@18½; Light Amber Alfalfa, 16½@17½; Hawaiian Light Amber, 15½.

Hamilton & Menderson, July 7, in Western Honey Bee: Honey market disorganized, through the reduction in price at New York by a Los Angeles marketing association. Prices to producers: White orange and sage, 18½@19; light amber sage, 16@17; light amber alfalfa, 16. Comb honey—So little offered as not to make a market. Beeswax, 40.

A. I. Root Co., July 5, Western Honey Bee: The honey market is still quiet. The demands of Eastern markets are below normal. Prices paid to producers: Comb honey, approximately 6.50 per case of 24 sections. Very little offered. Extracted—Amber, 15; light amber, 16@17; water-white orange, 19. Beeswax — 38 cash, 40 in trade.

HAY

Alfalfa Growers of California under date of July 24 says: The market for alfalfa hay continued firm throughout the week at full previous prices. We sold all the hay listed this week at these current prices by our members for nearby deliveries and could have placed more. Buying is of a general and healthy character, steady and well distributed in respect to volume and number of buyers. There have not been so far this season many competitive offerings from other states at prices attractive to California buyers in comparison with those of California hay, and it looks more and more as if such offerings and shipments would be considerably lighter this year than usual.

We quote from the Chamber of Commerce, Phoenix, as follows: "The acreage of alfalfa in the Salt River Valley has been reduced very largely. Some three or four years ago we had approximately one-half of our acreage in alfalfa, at least 125,000 acres. While the acreage of land under cultivation has increased also during the past several years, the acreage of cotton has increased to such an extent that the alfalfa acreage has been reduced very largely and at the present time our acreage is believed to be about 40,000 acres, with about 15,000 acres of alfalfa and Bermuda and Johnson grass mixed, which is used almost wholly as pasture. The acreage of alfalfa throughout the state is about 118,000. This is a decrease of about 50,000 acres from last year."

During the week ending July 17 there were received 1,500 tons on the Los Angeles tracks of all grades (300 tons of which were left over), as compared with 1,700 tons for the week ending July 10.

Southern Prices:

Choice alfalfa	41.00
No. 1 dairy alfalfa	36.00
Standard dairy	33.00
Stock hay	29.00
Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:	
Tame Oats	25.00@27.00
Barley	18.00@24.00
Alfalfa	26.00@32.00
Barley straw	3.00@10.00

GRAIN AND FEEDS

A little weaker, especially in spot stuff. There is a great range in price because of vast difference in quality.

Grain Exchange prices bid July 20:

Corn: Yellow, bulk, 3.93½	
Barley: Carlots, 2.73½@2.81¼	
Kafir: Eastern No. 3, 2.70	
Milo: Eastern bulk, 2.83½	
Bran: Kansas, 57.00	

San Francisco Markets

San Francisco, July 20, 1920.

BUTTER

Quotations made daily by the San Francisco Wholesale Dairy Produce Exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by the wholesalers to producers are eight per cent less.

POULTRY

Wholesale prices are:

Leghorn, 21@23; large, 27@38; roosters young, 45@50; old, 18@20; broilers, 32@37; fryers, 37@38; turkeys, live, 37@40. Ducks: Indian Runner, 21@23; Pekin, 22@25. Squabs, 55@60; pigeons, doz., 2.35@2.50.

Belgian hares, live, 15@17; Jack rabbits, dozen, 1.50@3.50.

LIVESTOCK

Western Meat Company prices are:

Cattle: Grass steers, No. 1, weighing 1,000 to 1,200 lbs., 9½@10; do, 1,200 to 1,400 lbs., 9@9½; do, second quality, 7@8; thin, 6@7. Bulls and stags: Good, 4@5; fair, 3@3½.

Cows and helpers: No. 1, 8@8½; second quality, 6@7; common to thin, 2@4.

Calves: Lightweight, 10½@11; medium, 9@10; heavy, 8@8½.

Lambs: Milk, 11@11½; yearlings, 8@8½.

Sheep: Wethers, 7@8; ewes, 5½@6.

Hogs: Weighing 100 to 150 lbs., 15½; 150 to 225 lbs., 16; 225 to 300 lbs., 15½; 300 to 400 lbs., 14½.

Virden Packing Company quotes prices on livestock, weighed and delivered off cars at its plant, South San Francisco, as follows:

Cattle: Good steers, 1,000 to 1,100 lbs., 10@10½; top steers, 1,100 to 1,200 lbs., 9@9½; top steers, 1,200 lbs. and over, market price; good cows and helpers, 8@8½; No. 2 cows and helpers, 6½@7; good fished, 100 to 150 lbs., 15½; 150 to 225 lbs., 16½; 225 to 300 lbs., 15½; over 300 lbs., 14½; under 100 lbs., 14½.

Calves: Light, 13@14.

Hogs: Top packer, hard and well finished, 100 to 150 lbs., 15; 150 to 225 lbs., 16; 225 to 300 lbs., 15; over 300 lbs., 14½; under 100 lbs., 13½.

Ewes: Full wool, 6½@7.

Wethers: Full wool, 7½@8.

Yearlings: 9@9½.

ONIONS

Onions: New reds, 50@75; whites, 75 cr.; green onions, 1.25@1.50. Garlic, new, 10@12½.

POTATOES

River, cwt., 4.50@5.00; fy., 5.25@5.50; Sweets, No. 1, 10@12 lb.; No. 2, 4@6.

VEGETABLES

Wholesale selling price:

Beans: Lb., String, 8@10; Wax, 2@5.

Cucumbers: So., 60@75; Bay, 1.75@2.25.

Corn: Sack, 2.00@5.00.

Eggplant: Livingston, 9@10; So., 5@8.

Okra: bx., 1.00@1.25.

Peppers: Bellis, 10@15 for large, 5@9 for small; Chilli, 6@8.

Peas: Lb., green, 5@7.

Radish, 7@9 doz. bunches.

Spinach: lb., 4@5.

Squash: Summer, Sacramento, lug, 75@1.00.

Tomatoes: No. 1, 1.00@1.25; No. 2, 50@60.

DECIDUOUS FRUITS

Apples: Red Astrachan, Los Angeles lug, 75¢@1.00; wrapped, bx., 2.25@2.75; Crab, 1.25@2.00.

Apricots: Imperial Valley, Los Angeles lugs, 4@8 per lb.; 1.00@1.50 per crate.

Bananas: lb., 8@10.

Blackberries: Dr., 35@50.

Cantaloupes: Ponies, 2.00@2.25; standards, 2.50@3.00; flats, 90¢@1.15 box.

Cherries: Black, 1.50@2.00 per drawer; blacks, 10@20 lb., according to quality; Royal Annes, lb., 10@15.

Currants: 50@65 dr.; 4.00@7.00 ch.

Figs: 1.00@1.25 for white and Brunswick per box of one layer; two layer, 1.50@2.00.

Gooseberries: lb., 5@7; English, 15@17½.

Loganberries: Red, dr., 50@65.

Peaches: Boxes, 75@150.

Pears: Madeline or Dearborn, lugs, 2.25@2.75; small, 1.00@1.25; Bartlett, No. 1, 3.50@4.00; No. 2, 2.00@2.25.

Pineapples: Doz., 3.00@4.25.

Plums: Apex, 1.50@1.75 per crate; Beauty, 1.50@1.75; Climax, 1.25@1.50; Clyman, 1.25@1.50.

Raspberries: dr., 60@75; cr., 1.50@1.75.

Strawberries: Large, 75¢@1.00; small, 50@65.

Watermelons: Imperial Valley, lb., 2@3.

Honey Dew: cr., 1.50@2.00.

CITRUS

Box: Lemons, standards, 2.50@5.50; lemons, 1.25@2.00; grapefruit, 2.00@2.50; navel oranges, 4.00@6.00.

BEANS AND PEAS

California Bean Growers Association, San Francisco, July 17.

There has been no material change in the California bean market since our last report to you and we do not look for much activity until the latter part of this month or, perhaps, next month. Quite a little interest has been shown recently in California Pinks but the White varieties have been very inactive. The trade here is offering for shipment at about the following prices:

Large Whites	6.15@6.30
Small Whites	5.75@6.10
Pinks	6.65@6.75
Cranberries	6.75@7.00
Black Eyes	8.25@8.50
Red Mexicans	8.25@8.50
Red Kidneys	14.00@14.50
Bayos	10.25@10.50

HOPS

1919 crop, 85¢@1.00 per lb. Prices to growers for 1920 crop, 65¢@80 per lb.

HONEY

Reported by Rafael & Wing in Western Honey Bee July 5:

Small lots of honey are beginning to arrive, and prices show a tendency to weaken. Buyers are buying only for their immediate needs. Reports from different Valley points tend to show that the crop will be much better than last season. Bees are in better condition than at the same time last year. Several large lots of Hawaiian honey are offered, with no takers.

Prices to producers as follows: White orange, 20; light amber orange, 18@18½; light amber alfalfa, 16@17; amber, 14@15. Beeswax, 40@42.

GRAIN

Wheat: 4.20@4.35.

Oats: Red feed, 3.00@3.15.

Corn: California Yellow, 3.65@3.75 per cental; California milo maize, 3.50@3.65.

Barley: No. 1 feed, 2.75@2.85.

HAY

Under date of July 17, A. W. Scott Co. says:

Receipts past week 2,346 tons. None is being taken into storage by consumers and purchases are only made for daily requirements. Prices in the country are much easier than last week as baling progresses. Service on the railroad is improved and with the light shipping seems to move about all that the demand

calls for. Reports from the country are to the effect that markets at various points are in the same dull condition as is the San Francisco market. Not much hay is as yet moving into country warehouses. Alfalfa has been quite a bit weaker and sales at from 1.00@2.00 per ton less than last week have been reported through the country districts. A little export hay has gone out from this port during the week, but trading has been on close margins and in small quantities to various ports of consumption.

We quote today wholesale prices in carload lots (old crop) as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.)

Old Hay: Prices nominal. Old straw nominal.

New Hay:

Wheat hay (light 5 wire bales) 26.00@28.00

Tame Oat hay 26.00@28.00

Wild Oat hay 20.00@22.00

Barley hay 20.00@23.00

Alfalfa hay first cutting 20.00@25.00

Alfalfa hay second cutting 24.00@28.00

Alfalfa Growers of California quote prices for Northern Districts:

No. 1 dairy alfalfa 33.00

Standard dairy 32.00

Stock hay 28.00

Citrus Markets

Los Angeles, July 21, 1920.

Valencias are still in keen demand and good prices are prevailing in every market.

Lemons are being shipped in larger quantities than for some months but price is still most unsatisfactory.

Shipments

transportation authority who has been representing the American Farm Bureau Federation at the recent interstate commerce advanced railroad rate hearing, present at the meeting.

Arrangements are being made for the grain and livestock interests to meet in separate sessions. The American Farm Bureau Federation is not directly engaged in marketing commodities, but its purpose is rather to assist through its various agencies all real farmers cooperative movements. It does stand unqualifiedly for the development of a unified marketing program serving the interests of American agriculture. If all elements are ready to give their best and receive the other parties' best, out of this conference will develop the greatest marketing movement yet accomplished. Any attempt at exploitation will be out of order. Hotel reservations may be made in advance through the American Farm Bureau Federation, 5 South Wabash Avenue, Chicago.

RAMBLES ALONG RICE PADDIES
(Continued from Page 91.)

From figures given to me by John P. Ryan, superintendent of the Glenn-Colusa district, I gathered the information that in the Glenn and Colusa irrigation district there are approximately 47,000 acres; in the Provident irrigation district (P. B. Cross), between 22,000 and 25,000 acres; in Glenn-Cordova-Princeton, 8,000 acres; in the Williams district, 9,500 acres; small independent districts along the river, 5,000 acres; District No. 108, 15,000 acres; Jacinto, Delevan-Compton-Zumwalt, and small districts, some of them irrigated from wells, enough to make a grand total of considerably over 100,000 acres. Thirty sacks to the acre, 100 pounds to the sack, six, possibly eight, cents a pound, gives an idea of the wealth being brought to California by these fields, many of them on lands formerly considered worthless.

In 1915 California produced 960,000 bags of rice; in 1916, 1,929,000; 1917, 2,520,000; 1918, 3,300,000; 1919, 3,500,000; this last from about 140,000 acres of land. As shown above the Glenn-Colusa section alone has this year planted nearly 100,000 acres. How much plantings in other sections will increase this I cannot say, but if the water continues, last year's production must be wonderfully increased.

FRUIT GROWERS TO HAVE SHIPPING POINT INSPECTION

At a meeting of deciduous fruit distributors with officials of the state department of agriculture on June 1 a committee of fruit men was appointed to act with F. W. Read, specialist in standardization, in formulating a plan of action for the present season. At a meeting of the committee it was agreed that the principal shippers of deciduous fruits would underwrite the plan to the extent of fifteen to twenty thousand dollars to start the work. The federal bureau of markets has consented to assist in paying the salary of an assistant to Mr. Read in the work of organizing the shipping point inspection service.

A ruling from the office of the attorney general holds that the director of agriculture through the office of standardization may issue certificates as to the quality and condition of fruits and vegetables at the shipping point and that such certificates may state that "this certificate is receivable as prima facie evidence of the truth of the statement contained therein in all courts in the state of California."

WHO GETS THE MONEY?

Permit me to call your attention to two documents that have a bearing on the two editorials in your issue of June 12, headed, "Reducing Food Prices" and "What's the Idea?" "The relation between wages and the increased cost of living; an analysis of the effect of increased wages and profits on commodity prices," submitted as evidence to the United States railroad labor board, reveals many important statistics bearing on the subject of "Reducing Food Prices." The evidence was generally not mentioned by the newspapers. However, the New York World said the evidence is "incontrovertible unless the corporations of the country want to take the position that their own financial

statements are false." See the "Nation," June 12, page 796. As one example, see the evidence relating to the packing industry. The average annual percentage of profit on capital stock increased from 14.4 in the years 1912-14 to 36.9 in the years 1916-18. The advance in the wholesale price of beef was over 12 times as great as the total labor cost of the products. Take shoes: In 1914 profits absorbed nearly half the price paid by the consumer; all the labor from the hide to the finished shoe absorbed less than one-sixth of the cost to the consumer. In 1917 labor absorbed only one-ninth.

I am calling your attention to this so that you, as an individual, regardless of the policy of your paper, may, if you so desire, ascertain the facts as to labor's share in increased prices. A tremendous volume of misinformation on this subject is now current in all sorts of publications. The result of the situation desired by those engaged in this propaganda would be as unfortunate for the farmer as it would be for other producers. The basic idea is that of imperial Rome: "Divide and rule." Protected by mutual distrusts, the large parasitic class hopes to continue to levy tribute on the producers. Now my definition of a producer is as wide as life itself. Any one who contributes in a useful way to the work or play, the love or religion of the human individual, is a producer. He who lives by exacting a toll from the earth's treasures as they are transferred, in one shape or another, from one individual to a different individual, is a parasite and can be eliminated. The machinery of distribution does not need them. In fact, the machinery cannot function freely until the tollgatherers are removed.

But I must stop. I had intended no dialectics or information about "incentives" or "reward" or "savings." I simply wanted to tell you about the two articles and let you do your own thinking.

The document that is of interest in connection with the editorial, "What's the Idea," is the statement showing the distribution of government expenses compiled by Dr. Rosa mentioned on page 27, Literary Digest, June 12, 1920. The farmer can readily ascertain from this that out of every \$100 he pays the government (either directly as income tax or indirectly), the government spends 63 cents (about) on agriculture, one cent in looking after the interests of labor and \$93 on war.

Apologizing for the unintended length of this letter and assuring you that I have an active interest in farming, though not at present working on the farm because of circumstances beyond my control, I am, A. Lewis, Los Angeles.

KEEP EGGS COOL

Statistics show that from one-fourth to one-half the eggs produced during the summer months are a partial or total loss, says H. L. Kempster of the University of Missouri college of agriculture. Heat is directly or indirectly responsible for enormous losses. Heat causes germ growth, embryo and mold development, increases evaporation and causes eggs to become bad in a very short time.

Nearly all losses due to heat can be avoided by the ordinary conveniences that the average farm provides. This is especially true provided the farmer keeps roosterless flocks. If the farmers would take the same care of eggs that they do of butter and cream before and during the time it is taken to market there would be little loss because of heat. Any temperature above 70 degrees causes eggs to start deteriorating. Even under the best of conditions eggs should be marketed at least once a week.

Eggs should be collected daily and should be cooled as quickly as possible. A sweet, fresh basement which is cool or a cyclone cellar makes a satisfactory place to store eggs. They may also be kept cool by placing them in a bucket and lowering into a well. Avoid storing in a musty basement, keep away from flies and remember that the above suggested conditions are better than a room in the house.

CONSERVING MOISTURE

"I went 20 miles on a gallon yesterday."
"That's nothing. I went two months on a quart."

VALUE OF INOCULATION

We believe that there are circumstances in which inoculation of leguminous seeds may result in material increase of crops and more rapid up-building of soils. There is little question that there are circumstances, however, where lands have grown leguminous plants for ages and artificial inoculation may be very slight or possibly nil in effect. The Butte County farm bureau has been making some tests, and the last issue of the County Farm News reports:

About 30 test plots of the use of inoculation bacteria on leguminous seeds were planted in the county this year as farm bureau demonstrations to determine the value of the inoculation of cover crop seeds, etc. These experimental plantings all had adjacent check plots planted with uninoculated seed. To date almost all the reports which have been turned in show no beneficial results of the use of inoculation bacteria. However, it is not fair to draw positive conclusions this year, because the small rainfall did not produce a normal growth of cover crops. These demonstrations must be repeated before definite results can be secured.

A number of alfalfa seed inoculation experiments are being tried by farm bureau members in various parts of the county and the results of these demonstrations will be known later in the year.

Only by planting check strips of inoculated and uninoculated seed can the real value of inoculation be determined.

FISH FERTILIZER PLANT IN LOWER CALIFORNIA

According to a recent report from Consul Burdett, a new fish fertilizer plant, financed by American capital, is ready to start operating at Sauzal, near Ensenada, Lower California, Mexico. In 1918 the territorial government of Cantu, at a cost of \$80,000, erected a plant at Sauzal to convert kelp into materials for use in powder manufacturing. However, the war ended just as the plant was ready for operation.

The building, machinery and pier were acquired by American capital, which has remodeled the plant, installed additional machinery, and is now ready to operate it as a reduction plant producing fish meal fertilizer and fish oil as a by-product. Later it is intended to install a cannery to pack the edible fish.

The plant has a present capacity of 150 tons of fish per day. Schooners operating in Mexican waters off the Ensenada coast will catch the fish and deliver it at the company's pier. The more valuable of the edible fish will, naturally, be sent to other markets in San Diego and Los Angeles because of the high price paid there, while the lower grade fish will go to the fertilizer plant.

Skagit County Fair, Washington, August 9-14.

SORGHUMS MAY BE POISONOUS

Under the name, "sorghum," are included sweet sorghum or sorgo, milo, kafir, broomcorn, kaoliang, feterita, Sudan grass, etc. Some of these plants, and possibly all of them, may be poisonous under certain conditions. The poison is prussic or hydrocyanic acid.

In the dry land districts conditions are favorable for poisoning. When cane or kafir has made a stunted growth for two or three weeks before frost the most poisoning occurs. After it has been cured by cutting or frost it has never been known to kill animals.

A few mouthfuls of kafir on an empty stomach have been known to kill a cow in ten minutes, says Dr. Glover of the Colorado agricultural college. Prussic acid forms in the stomach very quickly from the presence of a glucoside in the corn which is acted upon by a ferment.

Conditions for poisoning have been found in quite a number of both native and domesticated plants, and it is quite possible that in many cases where animals have died mysteriously without the presence of either infection or any known poisonous plant, that some plant capable of developing prussic acid is responsible.

Farmers should know the conditions under which poisoning is liable to occur and take no chances. Acute cases are so rapidly fatal that the animal is usually dead before remedial measures can be adopted.

IT DOES LOOK IT

Meiba went with her parents to a cafeteria for dinner the other day. When the tot saw her mother going around with the tray she called out: "Muvver, do you has to work for our dinner?" D. J. T.

Watch the late sown lettuce, turnips, etc., for green aphids. This insect may be kept in check by spraying with some of the tobacco preparations. The treatment will have to be repeated several times to get all the insects.

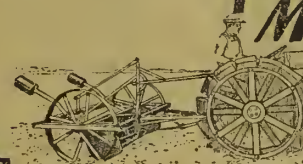

Iris may be set out this month and next. There are many fine varieties to choose from now-a-days.

Move More Dirt at Less Cost

with a **Compton** one-man **TRACTOR SCRAPER**

Operated by the tractor driver from the tractor seat. One man does it all. Moves more dirt with less power. The 5 foot size does the work of 3 or 4 four-horse scraper teams. Saves enough time, horse-feed and labor to pay for itself in a few days. A size for every tractor. Prices from \$215 to \$335.

Send for descriptive circular and price list.

How it Happens

that SPERRY ^{DRIFTED SNOW} FLOUR
is always the same

TO begin with, it doesn't *happen*. It's just a natural, inevitable result of marvelous accuracy in making. This scientific and practical care and skill enter into the making of Sperry Drifted Snow Flour every step of the way, from the selection and proper proportioning and thorough blending of the various wheats to the very sewing of the sack in which it comes to you.

Chemists test Sperry Drifted Snow Flour at every stage of its making. And finally when each milling is finished, repeated tests are made in the baking laboratory further to "prove perfection absolutely perfect." Then, and not till then, is Sperry Drifted Snow Flour permitted to go to your grocer for *your* service.

Ask your grocer for Sperry Drifted Snow Flour—"The Standard since 1852"—and see that you get it!

No. 5

Aqueduct of Anderson-Cottonwood Irrigation District

The Story of Hank Wise

Hank Wise conceived the idea of mixing saw dust with the feed for his cows. Each day he increased the amount of saw dust and decreased the feed. But just as he reached the point where he was using pure saw dust, his cows died.

Here's a curious fact: The ranch owner who gets along with "just any kind of silo" is in the same class with Hank Wise. He may not know it, but he is really losing instead of saving.

The improperly constructed silo leaks air; air prevents fermentation and results in spoiled silage unfit for feed; the cost of this spoiled silage may equal the difference between silage and dry feed. Thus it is costing the ranch owner just as much to feed silage as dry feed plus the cost of the silo.

How much better it is to own a dependable Simplex Silo—dependable because it is built in accordance with scientific requirements. There is no leakage in a Simplex because there are no end-joints—the one-piece staves take care of that.

There are no air pockets nor honey-combing of the inner wall—the smooth surface of the Clear Oregon Pine (Douglas Fir) takes care of that.

The Simplex is always in a true circle, always proof against twisting, warping and collapsing — the Crissell Tangent Top, Patent Interlocking Anchorage System and steel hoops take care of that.

In short, the qualifications of the Simplex are summed up in the words of the agricultural experts who pronounced it "scientifically correct."

Wouldn't you prefer to be sure with a Simplex than to take chances, particularly this year when the saving of feed is so vitally necessary?

THE WHEEL OF THE PAPEC with its six fans and small pipe throws and blows a steady stream of silage with a force much greater than a cutter with four or less fans.

The Need of a Better Livestock Program

By R. P. Royce

THE present season is proving a disastrous one for many men in the livestock business. On every hand can be heard complaint. Generally speaking, abnormal scarcity and high priced feed, insufficient and inefficient labor and unsatisfactory markets are the principal factors making for the pronounced dissatisfaction.

be, forced to liquidate their holdings in an effort to stop the heavy drain on their resources. Deplorable as the situation is, an analysis of the problem can hardly fail to lead to the certain definite conclusion that out of the present mess and muddle must come a readjustment of our livestock

of the state and nation than the production of livestock. Our very existence is dependent upon the stable and profitable business of livestock production. The growing and handling of livestock is not going to be permitted to go "to pot." Our people must have milk and meat and wool. Of equal importance is the primary

equally fundamental—no man or set of men will continue their efforts in any business in which there is no profit. If the consuming public believes otherwise, it is due for a sad, sudden, emphatic awakening. Let the present liquidation continue—and it is not confined to California—the public will wake some morning with an empty milk bottle and a long series of meatless days ahead of it. When that time comes there will be a mad scram-

Steer Profits and Losses

In reference to the above chart, Wallace's Farmer says: "The steers which were marketed in June were fattened on corn that cost \$1.63 on a Chicago No. 2 basis. As the average of ten years, it has required the value of \$3.3 bushels of such corn to convert the feeder weighing 1,000 pounds in December into a 1,300 pound fat steer for the June market. This past December 1,000 pound steers cost \$91. The total cost of a 1,300 pound steer finished in June was about \$226.70. The selling price was \$15.30 a hundred, or \$198.90. The loss for June was about \$27.80 per head, as compared with a loss of \$56.40 per head for May and \$45.87 for April."—Engravings from Wallace's Farmer, Des Moines, Iowa.

Surely such a set of conditions as are facing producers are calculated to try the stuff that men are made of, and there can be no doubt but that many men are being and will continue to

activities to a new and safer order of things.

Fundamentally, we can be sure of this: There is no business of greater importance to the continued welfare

role livestock must occupy in the matter of soil fertility. Therefore, given a thoroughly sound and primary business, we have the one basis for a permanent business. But this is true, and

ble for the short supply and prices will advance accordingly.

Now the average livestock man is put up on just about the same specific (Continued on Page 134.)

Hog Profits and Losses

The above chart shows in a very graphic way the ups and downs of the hog market, based on Chicago prices for hogs and measured by the ten year average corn equivalent. For example the ten year average June price for pork was equivalent to 12.1 bushels of No. 2 corn. Last June hogs averaged \$14.65 per hundred at Chicago. According to the chart they should have brought \$19.81.—Engravings from Wallace's Farmer, Des Moines, Iowa.

Citrus Insect Pest Control

By Ernest Branton

THE third annual citrus spraying and fumigation school of the Los Angeles County farm bureau was held in the Pomona high school Friday, July 23, presided over by Robert H. Neely, county vice-president. The subject for the forenoon was spraying for citrus pests, and, for the afternoon, fumigation of citrus pests.

The first speaker, though not on the announced program, was Farm Adviser Hodgson, who briefly outlined the work of the farm bureau and farm adviser resulting from transferring a portion of the activities of the United States department of agriculture and state college of agriculture to farm bureaus. Thereby these departments may get in close personal contact with the farmer, bringing the school or educational plan close to him instead of his having to apply to these far away general headquarters.

Red Spider Control

This subject was first treated by Rollin La Follette, superintendent of pest control on the Leffingwell ranch, Whittier. We quote: "This pest first made its appearance in 1895. Its life cycle is 35 to 40 days. Its presence

is indicated by pale silvery foliage and pale color of the fruit, being worst in the tops of the trees. When in sufficient numbers it gets on lemons in storage, especially at the stem end. Our experience has been that the oil sprays are not satisfactory. The lime-sulphur spray is better and is most effective in the hottest weather, at

75 to 80 degrees. Dry sprays are cheaper but less efficient than liquid sprays. We use 75 feet of hose and spray guns, the latter being far preferable to rods. The force turns the leaves over and so reaches both sides. Two men work each outfit, a driver-sprayer and a second sprayer. The material is applied at 250 to 275

pounds pressure. It is mixed in lots of 100 gallons at a time and one man will mix eight lots a day. Sometimes but one spraying a year is necessary, but for best control one in the fall and one in spring or early summer is advised. To sum it up, success comes from spraying two to three times a year, keeping machines in good condition, keeping experienced help, mixing your own sprays, applying first in (Continued on Page 126.)

Where Hydrocyanic Acid Gas Is Manufactured

Agricultural News Notes of the Pacific Coast

Northern California

Sonoma County fair will be held August 23-29.

Shasta County farm bureau fair will be held October 1-2 at Redding.

Alameda County farm bureau has established a branch office at Livermore.

The California Almond Growers Exchange has enlarged its San Francisco headquarters.

The Sacramento River is declared to be the lowest ever known at this season of the year.

Alameda County hay balers report crop running much heavier than earlier season estimates.

Fruits for exhibition at the coming state fair are being placed in cold storage in Sacramento.

The Apple Growers Union of Sebastopol has named \$2.75 per box as opening price on Gravensteins.

The board of supervisors of Lake County has agreed to support volunteer fire fighting companies.

Lake County irrigators are circulating petitions asking for the formation of a county irrigation district.

Students contemplating entering the University of California are expected to file applications prior to August 2.

Opening prices on Gravensteins have been named by the Apple Growers Union of Sebastopol at \$2.75 per box f. o. b.

The Prune and Apricot Growers Inc. has named opening prices on apricots, which may be found on market page this week.

The Sacramento Valley Seed Company is beginning the shipping of seed peas which have grown on a thousand acres in the Sacramento Valley.

One sheep herder, driving 600 sheep from Corning to their summer range, arrived with only seven head, the remainder being scattered and lost.

The Poultry Producers warehouse at Petaluma received more than 2,000 cases of eggs a day during April and May, 42 per day more than during same period in 1919.

The chamber of commerce of Sacramento is throwing its influence with the rice growers in the effort to have them enjoined from taking water from the Sacramento River.

Tehama County farm bureau market department recently held its first open sale of fat stock. Four cars of hogs and one of cattle were sold, hogs going at \$14.50 and steers at \$10.50.

Chico chamber of commerce has elected officers of a fair association and appointed committees to stage an agricultural fair. Allison Ware is president and Frank D. Durfee is secretary.

Gravenstein growers in the Sebastopol section of Sonoma County report fruit sizing and coloring better than usual. Growers are making a special point of holding fruit till full maturity before packing.

Eldorado County pear growers are taking steps to protect the brand of their pears in the shipping of "frost ringed" fruit. They are insisting that these frost marked pears shall be plainly distinguished from others under regular brand and labeled "Frost Marked." This mark does not injure fruit but is a blemish affecting appearance.

Central California

Fresno is muzzling all dogs because of rabies.

The Peach Growers Association plant at Clovis is being remodeled and enlarged.

Turlock fat hog auction scheduled for July 20 has been postponed until August 4.

The close of the apricot season in the Santa Clara Valley saw green fruit selling as high as \$110.

Kings County has planted this season a considerable acreage to Lovell, Muir and Elberta peaches.

Watsonville cannery has closed its run on cherries, having a larger season than any preceding year.

Terra Bella is building its second citrus packing house, which will be ready for the 1920 Navel crop.

The state fish and game commission has planted 50,000 trout fry in the streams of Santa Clara County.

Santa Cruz County apple growers report tussock moth and leaf roller exceptionally prevalent this year.

New settlers are arriving on the second unit of the Delhi Colony. Walter E. Packard is superintendent of the settlement.

Fresno's plum shipping season has closed with by far the greatest shipments of any season. Prices range around \$200 per ton.

The California Associated Olive Growers is suing former President Martin for \$12,000 because of deal with another corporation.

The new plant of the California Peach Growers is equipped with "practically peeled" machinery and other most improved and up to date appliances.

Fresno reports 90 per cent peach crop. Packing houses are now handling the fresh fruit and canneries are operating on peaches at Selma, Reedley and Fresno.

The chamber of commerce of San Jose has taken steps to build a large number of new homes for fruit workers and others who wish to locate in the Santa Clara Valley.

Tulare County reports field mice working havoc in some of the orange orchards, especially those which have heavy mulches of weeds or straw on the surface. Commissioner Collins is taking up the matter.

Sales Manager Sturtevant of the California Peach Growers has just returned from Eastern market centers and reports dried fruits which were returned to the East from Europe are practically cleaned up, so they will have little effect on this year's buying.

Commissioner Collins of Tulare County reports transactions for the past year and gives particular attention to the fumigation campaign made against the gray scale. The season was opened on the night of July 21, 1919, and continued till October 1. Nearly 2,000 acres were treated on 135 different properties.

In the campaign conducted by the California Peach Growers Association to gain control of fig acreage of this section, \$350,000 has been subscribed. Five hundred thousand dollars is required before the peach growers association will take over the fig crop. This will give them a 75 per cent control of the acreage in the district.

Southern California

Indio is erecting cotton gin.

Citrus growers discussed fumigation at Pomona last week.

The Japanese own 2,000 acres of land in Ventura County.

Walnut growers are discussing effect of dusting with tobacco extract.

A serious forest fire devastated the range back of San Jacinto and Hemet.

The cannery at Placentia, Orange County, will soon be in full swing on tomatoes.

The Cypress farm bureau center of Orange County holds its first meeting this week.

Orange County board of supervisors has appropriated \$1,500 to encourage the county fair.

Work is beginning on a \$15,000 walnut packing house at Lankershim, Los Angeles County.

The Holly Sugar Factory at Santa Ana, Orange County, is building cottages for its employees.

A La Habra, Orange County, hay producer recently saw a stack of 15 tons of hay go up in smoke.

Manager Churchill of the Lima Bean Association reports the association as doing a business aggregating \$5,000,000.

Independent walnut growers of Santa Ana, Orange County, are talking of organizing a new walnut association.

Coachella Valley has order for 500 bales of short staple cotton middling grade, December delivery at 36 cents per pound.

Orange County's board of supervisors has unanimously agreed to the continuation of the farm bureau budget another year.

Dairymen of Orange County recently met at the farm adviser's office and decided to continue cow testing association work.

Orange County's shipments of Valencias were 100 per cent greater during the month of June than the same month last year.

Packing and shipping of the season's dried apricots is now under full swing. The fruit is much larger and heavier than last year.

Roy Campbell of the United States bureau of entomology at Alhambra is investigating onion thrips depredations in the Coachella Valley.

San Fernando Valley, Los Angeles County, has shipped its greatest output of potatoes. The spuds have been averaging to growers about \$2,000 per car.

Church people of Covina, Los Angeles County, are counting all their Sunday laid eggs for two months to sell for aiding poor children to have an outing.

Malaga grapes of the Coachella Valley ripened so rapidly this season that great difficulty was experienced in securing sufficient help to handle them in the short season.

Field fires recently destroyed some \$6,000 worth of standing grain near Hemet and the insurance company carrying the risks made payment in full on policies carried.

Orange County sugar factories report the present season as probably having the longest run. The campaign will open about August 5. The beet acreage is greater than last year.

The Coast and General

Dairymen of Stephens County, Oregon, are organizing a cow testing association.

Lewis County, Washington, is now harvesting its greatest supply of cascara bark.

Thurston County, Washington, has just appointed its first county agricultural agent.

A new union depot, which has been dreamed of for many years, seems likely to be realized now before long by Phoenix, Arizona.

Dates for the Northern Arizona fair have been definitely set for October 14 to 16. The fair will be held at Prescott and is the eighth annual event of this kind.

Forest fires have been raging to a damaging extent over a part of the Coconino forest reserve of Arizona. A number of forest fires have also occurred in Santa Cruz County.

Extensive improvements have been made on the Indian Hot Springs resort in Graham County, which will make this one more of the natural wonders of Arizona which will be worth visiting.

The long staple cotton crop in the Salt River Valley of Arizona, which had a late start, with conditions in consequence somewhat below normal, is now looking better with prospects excellent for an average crop.

Weather reports show that the usual summer rains of Arizona have been thus far conspicuously absent. Only in a few localities have there been any. The ranges are beginning to dry up and water will soon become short in many places.

The valuation of the mines of Arizona for the year 1920 has been fixed at some \$25,000,000 less than the valuation for last year, which was \$414,236,636. Railroads this year are rated \$101,064,350, an increase of \$1,000,000 over last year.

W. S. Norvell, water commissioner for Arizona, has received applications for water appropriations sufficient to irrigate 276,231 acres of land. A large number of these applications are pumping propositions, although 26 reservoirs are contemplated.

Yuma Valley, Arizona, reports loss of a million dollars because of lack of labor in harvesting last year's cotton crop. An association is now working to secure a labor supply for the coming crop, but some laborers are demanding as high as \$10 per day.

During a recent storm on the Navajo Indian reservation one of the medicine men was struck by lightning and was unconscious for four days. Instead of the "stars" that one is presumed to see at such times, he claims to have had visions of a big storm, with floods. His story has frightened the Indians so that many have fled into the higher lands, taking their sheep, cattle and other belongings.

A cotton growers tour was staged by County Agent H. C. Heard of Maricopa County, Arizona, Saturday, July 10. About 30 autos with nearly 100 farmers traveled some 30 miles, visiting five fields of cotton which had been handled in different ways or were on different types of soil. The object of the tour was to show by object lessons the correct method of handling the water for irrigation in order to prevent a too excessive growth of cotton stalks and leaves and to increase the number of squares.

Three Years Fumigation on the Leffingwell Rancho

THE Leffingwell Rancho is composed of about 350 acres, the greater part of this being lemons, some 24 years old and the rest 14 years old. About 200 acres is held by individual owners in small tracts, but the fumigation is still carried on by the rancho through the lemon association, which includes all of the acreage of the original ranch.

The only scale pest that we have in quantity is the black scale. In the Whittier region it hatches in June and July, so that fumigation starts the last of July or the first of August and continues into the winter months, at which time the second hatch is fumigated for, there being two generations a year in that region. We also are blessed with a few patches of red scale, but this has not as yet become a serious pest on the ranch, so only the control of the black scale will be considered.

Up to two years ago the equipment consisted of a string of between 60 and 70 45 foot tents. Lately we have added a string of 34 foot tents, which are used partly on the ranch and partly in outside work.

In former years one of the sub-foremen in the packing house who had some knowledge of fumigation, during the summer when work was slack in his own department, used to handle the fumigating crew under the supervision of the ranch foreman. During the past three years a man has been secured to devote all his time to pest work and he has in turn had charge of fumigation and the string of tents.

The 350 acres was divided off into blocks, ranging roughly from five to 20 acres and as a rule fumigated in these units. The blocks were inspected from time to time as to the amount and condition of scale, the idea being to hit about half the ranch each season, thus getting along with doing about 150 to 200 acres a year.

With only this amount of acreage to cover a season it would seem a very easy matter to hit the scale in just the right condition and thus secure an excellent kill, and such was the case for several years. We got by fine by fumigating half the acreage one year and the other half the next. But on checking up the records we found that there were certain blocks that had been fumigated for the past four or five years still showing considerable smut on the fruit. Even with a small acreage to do each season and careful watching we were not able to clean these groves up so they would go every other year.

This was the method followed during 1917, when about 140 acres were done in August and September, using the old method and sodium cyanide as a base for the gas. Although this work was very carefully done it showed up so poorly that half of it had to be done over again in 1918. This was due to the fact that the scale was so uneven it was impossible to find a time when a commercial kill could be obtained. It was not even possible to do the work every season and keep the trees clean so no fruit would go into the house unsmutted.

Fumigated Twice a Year

So during the season of 1918 we put in practice a little different method. We went over the blocks in the spring and picked out those that needed fumigation and again did the work in Au-

By J. R. La Follette, at Covina Citrus Meeting

gust and September, fumigating about 185 acres. Then we followed this up closely for the next two months and started in November to go over those that had shown up dirty again, finishing in February a total of six blocks, or 80 acres. Now it is interesting to note that this acreage had all been fumigated the year before and most of it the year before that, while other blocks were getting by with one fumigation every two years over the same period. This seems to prove that it was not a case of poor work, but a scale condition that had been in evidence for several years. This may look like a prohibitory expense and one that can only be carried by the large grower, but wherever we fumigated black scale twice within the year we found we did not have to do it again the next season, thus making an average of one fumigation a year after all, and since the trees and fruit are clean for the next 18 months you see we were money ahead. This would be a paying proposition even if the grower had to go out and borrow money, for the advantage of having a clean grove, healthy trees, more fruit and better fruit, to say nothing of dodging a bill for hand washing of fruit, would more than offset the extra expense.

Moreover, once these blocks were cleaned up we were able to get along on a fumigation every other year. I think this is a point that should be emphasized because I know of several groves in our vicinity that were fumigated last year and owing to a bad off-hatch condition a kill was not obtained. The owners could not be persuaded to hit them again in the winter when the second hatch came on and as a result the orchards have been dirty all season, injuring the trees and fruit. They will now have to be fumigated this summer and are in such shape that it is very doubtful if a kill will be obtained. Seemingly it would have been much better to have gone ahead and given two fumigations, even though it looked like a very heavy expense.

I think this is a point that should have great emphasis. I will admit that conditions vary greatly throughout the citrus districts and that there are places where two fumigations a year have not made a clean up, but I do know that on the Leffingwell Rancho we have been very successful in following this method and have been financially ahead by so doing. I also recall several examples of good red scale cleanups by giving two fumigations a year in our district.

Liquid Gas

Coming down to the season of 1919, we undertook several new methods of handling the work which might be of interest. In the first place we changed over to the liquid gas, and I might say in connection with this, since I have heard that several localities have been rather dissatisfied with the results obtained, that we have been well pleased with the kill we obtained and I think it is the general opinion of those in close touch with the work around our end of the county that the kill throughout the district has been the best obtained for years.

In comparing the cost of material on several blocks for 1917, when the

cyanofumer was used, against 1919, when liquid was the method employed, I find an increase of about 15 per cent in the cost of material. That is, trees that in 1917 cost 17 cents for material, last year cost 20 cents. When we stop to analyze these figures I do not think they will seem out of proportion in comparison to the rise in cost of other materials in the last two years. Of course, the trees had made a slight growth in that length of time, but I do not think this had as much to do with the increase as the loss from evaporation in handling the liquid gas. I think this has been much greater than many of us realize or thought it would be at the beginning of last season when its use became so general.

Last year we stored our gas in a ventilated room and kept the place wet down with a hose. This year we think the matter of keeping the temperature down to reduce evaporation so important that we contemplate the use of ice and the packing of the drums in shavings.

Daylight Fumigation

Another radical departure from the old and beaten path of the past was daylight fumigation. Daylight fumigation is a topic in itself and I do not feel in a position to go ahead and discuss it much in detail. I do think, though, you might be interested in the work we did on the ranch along that line last season and the results we obtained. I will not contend that the methods we used can be applied this season with the same results or that they could be used in another locality successfully. However, I do think they are a basis to work on for further development of daylight fumigation, and we intend to use them in that light.

Out of the 165 acres fumigated last year on the ranch 115 were done in the daytime. The first work on a commercial scale was done in October, beginning on the first day of the month. At that time we shot a 19 acre block of lemons, working from 1:00 in the afternoon on through the evening. The temperature ran anywhere from 70 to 86 degrees and the humidity from 23 up to 70. Incidentally we found throughout all our daylight work that the humidity had very little to do with the resulting kill or the amount of burning obtained on the trees. These tents were left on from 30 to 40 minutes during the daytime and along toward evening the time was lengthened up to one hour, after sundown. To handle this we used a double string of tents, 60 in all, and carried 30 of them every 30 minutes until after 4 p. m., then picked up the rest and left them on the full time. The dosage was kept at 77 per cent throughout the entire time. In this case you see the exposure was cut only.

The trees in this block varied greatly in size on account of resetting, being anywhere from two to 24 years old. This made it difficult to get a uniform dosage.

The results of this work, so far as scale kill was concerned, were excellent, but some trees burned in the tops on the south side where the sun's rays hit directly on the tent. This burning, so far as we were concerned on the ranch, was insignificant, as it was all

on foliage that had to be pruned out, sucker growth, and there was no fruit damage in any way. Also, the kill was much better than we had ever obtained by night work on the same piece.

A few days afterwards we tried daylight work on a block of oranges, starting in the morning after the dew had dried off and continuing until evening. This time we used a full string of 45 foot tents, 55 in number, leaving them on 50 to 60 minutes, dropping the schedule down to 66 per cent when the temperature got up above 62 degrees. We found that we got less burning than in the lemons but the kill did not seem to be as good.

This might indicate that a heavier dosage for a short time gives better results in daylight work than a light dosage for the longer time, although I would not want to go on record as making a positive statement to that effect.

Winter Campaign

This finished up our first campaign on the ranch and no more work was attempted until the last part of December, when the winter campaign was started on blocks that we were not able to get to in the summer when the scale was right. This work was all done during the daytime and the only hindering feature was the morning dews that sometimes hung on until 8:30 or 9 o'clock, and low temperatures in the mornings. In this work the temperature ran from 50 to 88 degrees on January 17, which was the hottest January day on record.

We followed more or less the practice of leaving the tents on 45 minutes and using a 100 per cent schedule at all temperatures under 75 degrees. Of course this varied some, depending on the condition of the sky and was left to the judgment of the man running the machine. When the thermometer got up above 75 degrees we cut our dosage to 88 per cent.

This time of the year it is not so important to watch the length of time the tents are on so closely.

In February we even used a schedule of 111 to 122 per cent for red scale in the daytime, with temperatures that ran as high as 78 degrees, but this was on very tough trees and at a time when the scale were very resistant.

All our winter work gave an excellent kill and a higher average, I think, than that done in the summer. This was due to several reasons: The fact that it was done in the daytime when we had the aid of the heat from the sun acting both on the scale and the gas; the condition of the trees, they being much more resistant at that time of the year and able to stand higher dosages of gas; the condition of the scale, as they grow more slowly in the winter and seem easier to kill than in the summer. We noticed that we could kill scale in the rubber stage that we could not touch at night in the summer time. The men were much more satisfied to work in the daytime and covered a lot more ground than at night. In fact, I know we would have experienced a lot of trouble holding crews through December and January when it was cold and damp at night and many orchards had cover crops to contend with.

Taking everything into consideration, our daylight work during the winter months was very satisfactory, but I do not think that the experience can be taken and applied directly to work this time of the year with safety, although I am not saying that it cannot be done.

In conclusion, I think the following points are of the most importance and the ones responsible for the results we have obtained:

Covering a small acreage with our tents each year so as to do the work when the scale is in the best condition.

Fumigating twice in one season, if necessary, to clean up off-hatch conditions that cannot be controlled with one fumigation a year.

Daylight fumigation, especially during the fall and winter months when the trees are more hardy and the scale easier to kill.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

THIS WEEK'S COVER

The Cultivator camera was roaming around in the extreme northern Sacramento Valley recently, and in southern Shasta County it was brought to bear on the aqueduct crossing the old bed of a river in the little city of Anderson. The waters of the Sacramento taken from the river in the town of Redding and carried underneath a part of that town through a half mile tunnel, are distributed by this, one of the newest of irrigation systems in California, the Anderson-Cottonwood district. These waters are distributed over lands in the Redding, Clear Creek and Churn Creek sections, and other rich lands around the towns of Anderson, Cottonwood and Bail's Ferry. To reach the Churn Creek section these waters are carried over the Sacramento River in great pipe lines swung under one of the Sacramento's many bridges. This irrigation district was organized in 1914 and completed in 1917. Its cost has been practically \$1,000,000, and it covers 32,500 acres of land. The greatest use of the waters of the district this year will be upon rice lands, this being the first year of rice culture in a large commercial way in Shasta and northern Tehama Counties.

The aqueduct shown on the cover

has been built after many miles of canal had been excavated, carrying the water up canyon and making many turns, necessitating such a waste of water in the loose gravel formation that the concrete structure was afterwards built, resulting in the saving of a vast quantity of water.

THE BIG JOB

Ex-Governor A. J. Wallace expresses himself thus emphatically on the Japanese question:

"If the population of Japan must have more territory for its overflow it must get it in some undeveloped area and that must be in some continent other than America. The gentleman's agreement is a decided failure and the picture bride menace must cease without delay. The big job before us is not to persuade citizens of California that California is not for Asiatics, but to teach the national legislature, the great East and Central West what the Japanese invasion really means."

WORTH A THOUSAND EACH

California realty is now declared to have reached a valuation of \$3,875,000,000, a per capita wealth in real estate of approximately one thousand dollars.

LEMONS

The lemon grower is getting his'n—"his'n" referring to red ink.

A year ago he was hopeful. Even in January it was suggested that when warm weather came the California lemon grower would get justice and at least a fair price for his product. The months passed; warm weather came; and the price continually gets no better. Just now it is getting no better fast.

Of course, we are referring to the California lemon grower. The hapless man on earth today, so far as finances add to happiness, is the Italian lemon grower. His fruit is coming into New York in a perfect flood. Nearly 200,000 boxes are now in the docks or due to arrive during the next 30 days.

The half cent a pound tariff makes their entrance most easy. The rate of exchange, which is holding down American exports, works to the advantage of the foreigner in the matter of our imports. Every dollar paid by Americans to the Mediterranean grower is practically four dollars to the grower in his own country. This is resulting in the American grower getting off the earth so far as lemon production is concerned. This is not an overstatement of the case nor a pessimistic view, but an expression in plain English of the situation now confronting many a Californian.

A lemon grower recently in this office stated that complete ruin faced him and many another lemon grower unless a change could be brought about. Lemon men fail to see any politics in the present situation but are demanding relief. If the country wishes to make its purchases of lemons from Mediterranean sections it may continue present methods of treating the lemon industry. If, however, it can realize the truth that there are times when the Mediterranean cannot meet the country's needs and feels that home production has certain advantages, we should meet the situation with something besides brass band music and front porch addresses.

Presumably the next session of congress will not be able to agree on any very definite plan for protecting American homes, but after March 4 there should be a fighting chance for real Americans.

We have spoken only of lemons. There are beans, and the bean grower has had his troubles. There are walnuts, raisins and other dried fruits, every one of which will have to compete with the flood from countries where the laborer is not expected to give to his children high school education, nor even to have a taste of meat more than about once a week.

AIN'T IT THE TRUTH?

The meat packers have an organization to which they have given the very dignified title, "Institute of American Meat Packers." From time to time the institute issues a statement concerning the meat and livestock situation. The reports are prepared very carefully and written in a vein of bland frankness suggesting a philanthropic concern for the producer. Ordinarily the information conveyed has been known to the producers for months and usually means nothing. We imagine the reports are never intended to create mirth, but occasionally one reaches our desk that does stir our sense of humor. To wit, a recent report:

"During nearly every month of 1920 producers lost money on cattle and many packers reported losses on beef. Prices of hogs and pork products are substantially lower now than at this time last year, due largely to diminished exports. The decrease in slaughter indicates that as a result of these losses some producers have cut down their herds and may restrict production. Such a situation would be an economic misfortune for both the livestock producer and the public. Past experience has been normally that higher prices for meat animals, and hence for meat, have followed restricted production, after which the consumer again restricted consumption. The ratio of livestock to population for the last 20 years, with the exception of one or two of the war years, has been constantly decreasing.

In some quarters world crop conditions and the price trend in corn and hay are interpreted favorably to producers of livestock. Those holding this view point out that lower prices for grain obviously would reduce the cost of raising livestock."

After frankly stating that "during nearly every month of 1920 producers lost money on cattle and many packers 'reported' losses of beef, which will logically lead to restricted production, the institute frankly gives the opinion that "such a situation would be an economic misfortune for both the livestock producer and for the public." In the face of the fact that the packer sets the price to the producer (all arguments to the contrary notwithstanding), and that price caused cattle to be marketed at a loss, they at least had good taste enough not to include themselves in the "economic misfortune" to follow restricted production. If the producer has failed to register a profit on cattle to date we fail to see where he will increase his "economic misfortune" by getting from under a losing game.

In the meantime, the packer wins either way production jumps.

We quite agree that lower feed costs will reduce the cost of raising livestock, but we feel rash enough to gamble a slick jitney that a profit for the producer will not necessarily follow, that is, unless the packers fail to run true to form and do not seize upon cheaper feed as a club to hammer down prices.

It's a great game if you don't weaken!

PREPARING FOR GREAT SHOW

Guy H. Hall, a representative of the National Association of Tractor and Implement Men, has arrived in California and is perfecting plans for the greatest show of farm implements, machinery and power. This will be the sixth great show under Mr. Hall's

Planning a Great Show

President Rainey of the Tractor and Implement Dealers Association of Southern California and Manager Guy H. Hall of Kansas City planning for the great National Tractor and Implement Show in Los Angeles.

supervision. There are to be only two shows held this year. Mr. Hall came with big ideas and a resolution to carry them out, but has been surprised and pleased at the unanimous support given him by local tractor and implement people, so that he is assured this united effort will result in a magnificent opportunity for California producers to become informed on today's necessities on an up to date California ranch. The labor situation, greater economy in production, and the need of the world as never before for food, impel to using this opportunity to the limit.

Mr. Hall is accompanied by Mr. Stewart of the Potts-Turnbul Advertising Agency, also of Kansas City, who will handle publicity.

CITRUS INSECT PEST CONTROL

(Continued from Page 123.)

the autumn when temperature is 85 to 90 and the greatest number of insects and fewest number of eggs are in evidence."

The next speaker was E. L. Prizer, who told of red spider control in the Chula Vista district of San Diego County, having a frontage on San Diego Bay nine miles south of the city. "Some of our orchardists spray; others allow the red spider to run its course. Three parasites work on the spider, a matter so important that I made a study of it for nine months. I found in some cases one-half of the spiders were destroyed in 12 days after appearance and all were gone in 30 days, and of the orchards examined 18 were clean. Spraying or fumigating upsets the normal relationship of parasites to spiders and defeats the good work they might do. We have found distillate spray most effective for it kills some of the eggs. Spraying in the Chula Vista district is not generally advisable, though one may occasionally prove profitable. I believe the same amount of time and money expended in keeping the orchard in prime condition is a better protection. To sum up: Predatory insects do control red spider, and fumigation kills the beneficial insects. We have had poor results with lime-sulphur, success with distillate. Do not spray in most active growing season when much foliage is young and tender."

In the discussion following the question was asked: "Are these predatory insects generally distributed over this end of the state? It was answered in the affirmative by Prizer and Quayle. The former acknowledged that the temperature at Chula Vista does not range high enough to make sulphur effective, as it needs 80 degrees, and at Chula Vista it seldom goes above 70. It was asked if arsenic mixed with the sprays would prove of value and answer by Professor Quayle was that arsenical sprays are of no value in combating red spider.

Dry Dusting

Ralph E. Smith, formerly plant pathologist with the University of California, spoke of the possibilities of the dry dusting method for the control of insect pests. "All know that nicotine will kill walnut and other aphids. The only problem is how best to do it. At first we tried tobacco dust, but it was not uniform in strength, so we turned to nicotine in 40 per cent strength, combined with a proper carrier. For some pests we use a very light carrier, as lime; for others a heavier one, as clay. For worms we are using arsenate of lead. The dust spray is superior to liquid sprays in several ways. With the latter where two to four tons of water was hauled about we now use 50 to 100 pounds of dust. Of course work with the latter is faster; also machinery used may be cheaper than for liquids. Two objections to dust spray for red spiders have been urged: low temperatures of some districts, rendering it comparatively less effective; and disagreeable effect on eyes and noses of pickers. For citrus aphids, which are bad in coastal districts, it should prove effective and economical but is needed in stronger doses than for walnut aphids and should be used early, as soon as aphids appear. Citrus thrips are easily killed by nicotine, as are all thrips."

Horticultural Commissioner Ryan was the next speaker and showed several charts and statistical tables to illustrate his statements. He said eradication is impossible, therefore control is the proper word to use. Scales of all sorts are very prevalent now for the weather has been favorable to their development. In 1917 we had a hot spell that killed a large per cent of them, but weather conditions in 1918-19 favored their development and increase. When weather conditions kill much scale fumigation removes nearly all the remainder and

the orchardist is highly pleased with the results. When conditions are bad for the fumigator a much larger percentage of live scale remains and the orchardist says fumigation is not sufficiently effective. It has been found by careful examination that in 61 per cent of fumigated orchards in Los Angeles County it was highly satisfactory, but in only 18 per cent of the sprayed groves was eradication approached."

J. D. Culbertson, assistant manager of the Limoneira, was next called upon to learn what means are taken by him to control red spider, but after mention of general conditions he referred answer to Sam Essig, in charge of their pest control department. The latter said they were still in doubt of the necessity for spraying, that they have blocks never sprayed for spider which yet are in good condition. At times the pest has been very threatening, but they let that period slip by and the orchards came out all right. There may be times and conditions where spraying is advisable. Fumigation is very destructive to predatory insects.

The Fumigation Phase

In the afternoon R. S. Woglum, in charge of fumigation investigations for the United States department of agriculture, read a paper on "Fumigation Developments During the 1919-1920 Season." He said some complaints were lodged that fumigation was ineffective and that liquid gas was not as good as the pot method or the cyanofumer. But that view is wrong. The last three years have been very favorable to the pests, but the 1919 fumigation work was very good, and charts shown proved his statements. Black scale has one principal hatch each year, occurring for 1920 just now. Fumigate early. Trees will not stand dosage required to destroy either eggs or mature insects.

Fumigate twice for "off hatches," once early and again two or three months later. Temperature is a considerable factor, high temperatures being favorable to fumigation. On the sunny side of a tree it was found 99 per cent were killed; on the shady side but 93 to 94 per cent. On one side the temperature was about 90; on the other only 70 to 74. Cover crops are a deterrent to liquid gas fumigation.

Scale in some sections and under some conditions are hard to kill. (Are they becoming immune?) Dormant scale is very hard to kill in cool weather. There was a difference of six percent in the kill between September and February under the same tent with the same dosage. The former was 99.9 and the latter but 93.94 mortality, following cold weather. Winter dosage should be increased, for it has been found that a 100 per cent schedule in winter is less effective than a 75 per cent schedule during summer. Use of liquid gas is superior to former methods. Fumigate before irrigations rather than after. Pointers: Use tape for determination of dosage; don't guess. Fumigate black scale while immature. Use heavier doses. Fumigate early, and twice in seasons of "off hatches." Avoid cover crops under tents. Avoid winter fumigation. Don't let nozzles get close to trees. Don't fumigate for at least a year after using Bordeaux.

Professor H. J. Quayle was on the program to open discussion on the Woglum paper, but said the latter had completely covered the field and left him in the predicament of the farmer who started to town with a wagonload of loose apples in wet weather. The farther he went up a long hill the worse conditions were, the horses stopping to rest more and more often. At last they could go no farther. On looking back the farmer saw the tailboard had come out and the apples

all run out on the mud. He simply said: "Stuck, b'gosh and nothing to unload."

But the professor did not quail. He said poor results often came from inattention to details—have everything ready. Make dosage heavy. From June to January scale is most resistant, therefore fumigate lemons from January to June. With oranges avoid periods when fruit would be injured. The heaviest foliaged trees need heaviest dosage. For *Coccus citricola* the best time to fumigate is from July 15 to August 1. Use a 110 per cent schedule.

The orchardists of the Pomona Valley have a "Growers Spray and Fumigation Company," and their manager, F. G. Wyman, was on the program to tell some of his troubles. He said: "Bad weather constitutes the most serious, and inefficient and inexperienced help was a good second. Wages are high but in the old days they paid by the day and now all is done by piece work, which is far more satisfactory. With pot or cyanofumer it was night work, although they could at times commence as early as 2 p. m. With liquid gas they work all day, for it occasionally is 105, in the sun, at 5 o'clock in the morning. After October 1 liquid gas is not used by us after 6 p. m. In 1910 the average cost per tree to the grower was 8.6 cents a tree. Now, with wages doubled, the cost in 1919 was but ten per cent higher. This was because no tents were bought, but tents are getting old and present price is almost appalling. Fortunately, liquid gas does not injure tents; the old pot method was very destructive, while the cyanofumer was somewhat injurious." He was strong in his commendation of liquid gas, as were all speakers on fumigation subjects. In fact, he said that at the present prices of tents the pot method would be prohibitive even if equally efficient.

LIQUID

HYDROCYANIC ACID

New Plant at Azusa, Cal., in Operation

The new plant of the Owl Fumigating Corporation, for making Liquid Hydrocyanic Acid, has been in active operation since July 7, 1920.

This plant is the latest word in engineering design.

Its capacity is equal to the entire fumigation requirements of California.

It is being operated under the constant supervision of trained chemical engineers.

The quality of the product is of the highest — a pure, water-white liquid, containing 95-98% HCN.

Our contract for Cyanide, which is made from-the-air, at Niagara Falls, in the largest Cyanide plant in the world, assures uninterrupted operation.

Our delivery system is prompt, dependable, and ample to meet all requirements.

Owl Fumigating Corporation is sole licensee under the Dingle Patents for the manufacture and use of Liquid Hydrocyanic Acid for fumigation

Owl Fumigating Corporation

Azusa, California

Progress of California Power Farming

By N. C. Wilson, California Tractor and Implement Association

Owing to the variety of soil types on the average California farm it is almost impossible to plow evenly with horses. With a good tractor of sufficient power, however, a furrow of even depth may easily be plowed through the most frequent soil variations. The uniform hard red clay subsoil that underlies much of the state has been heretofore broken up with dynamite. But this process left a hard packed wall, which, together with the danger element in dynamiting, tended to make subsoiling unpopular. Now, however, it has been demonstrated that by using a tractor the work can be done effectively and economically.

Manufacturers, in supplying the demands of farmers of the Pacific Coast, are making such special implements as orchard plows, combined harvesters and disks, and will exhibit them at the state fair at Sacramento, September 4-12. This exhibit and that of the Southern California power dealers later in the same month are of particular interest to Californians because of the romantic history of power farming in this state proper. The farms of early California covered vast expanses of land. Fields were often measured in square miles. Animal power on such ranges had its limitations, and 15 years ago the tractor

gained foothold in the state and has been steadily strengthening it ever since. The track driven tractor led for many years on the large farms, but as these became smaller the wheel tractor helped to meet the demand. The working hours of a California tractor are much longer than those of power implements in any other agricultural section. Day in and day out, until the rush season is over, large operators run three crews in eight hour shifts.

The direct result of such extensive power farming is the diversification of crops, the development of which in turn calls for new kinds of farm machinery. Many crops a few years ago strange to the fields of California have in a short time become leading products of the state. All are directly traceable to power farming machinery. Rice growing was introduced to California in 1912, and in 1919 the state's rice crop was the second largest in the United States. Land once worthless has been improved by rice, so that barley, broom corn and other crops can now be raised there. Another recent addition to our varied list is cotton. Two hundred and fifty thousand acres are this year under cultivation. Motor cultivators are used several times during the season

to cultivate the cotton. As soon after harvesting as possible the stalks are turned under by a tractor, to guard against the boll weevil, a pest which has not as yet made its appearance here. So again the motor driven implement wins.

Garden tractors find ready market on the small truck farms. All over the state unproductive land is being transformed through the use of a great irrigation system. Medium sized tractors of either the track driven or wheel type are employed extensively in truck farming.

Study of the farm machinery industry in California throws light upon what may be expected in the line of future developments. The range of power machinery is well adapted to every sort of farm, from a tiny orchard to a vast stock breeding enterprise. No agriculturist can fail to profit by attending the two important shows in September, one in each section of the state.

DR. SWINGLE WILL RETURN

Dr. Walter T. Swingle, in charge of crop physiology and breeding investigations, bureau of plant industry, has returned to Washington, D. C., after a two weeks' tour of California. Dr. Swingle said he expected soon to come to California to live as his work demanded such a change of residence, but loyal Californians will ever claim that lure of climate was a factor in the determination.

Dr. Swingle believes, as has been

predicted in the Cultivator, that we shall yet have varieties of dates suitable for home use throughout a greater part of California. Another fruit mentioned by him is the pistachio nut, and it is interesting to note that of \$150,000 worth of exports from Aleppo, Syria, in the first quarter of 1920, more than two-thirds were of pistachio nuts. He further expects to see the litchi nut grown here and asked the Cultivator to give the information that a fine work on "The Litchi," by G. W. Groff, has been published at the Canton Christian College, Canton, China, price \$2.25. Dr. Swingle's last days in California were spent in inspecting the government date orchards in the Coachella Valley. He says that out of 100,000 seedlings now growing 50,000 are fruiting.

SICILIAN LEMON INDUSTRY

By Alfred P. Dennis, Rome, Italy

The lemon industry is of special importance in relation to American trade. While American importation of Sicilian oranges is now limited to unimportant consignments of blood oranges, we are now importing enormous quantities of lemons and their derivatives in the form of peel, citrate of lime, citric acid and lemon oil.

For the last ten years the American importation of Sicilian lemons has shown a tendency to fall off, but it is now increasing. This is due to the increased demand for soft drinks, a result of national prohibition. The director of the Camera Agrumaria (Lemon Trust) at Messina estimates the exportation of lemons to the United States during the present year, January 1 to December 31, 1920, at not less than 1,000,000 boxes of 300 lemons each.

Irrigation is necessary for at least eight months out of 12, and a commercial fertilizer, sulphate of ammonia, is applied. As a rule, however, the volcanic soil in which the lemon groves flourish is of almost inexhaustible fertility. Three crops of lemons are produced yearly—the first in October, the second in February; the third, or summer crop, is being gathered at the present time (May 15), and 300,000 cases are now packed ready for shipment at the two ports of Palermo and Messina. The returns from lemon growing, with the three abundant yields per year, are sufficient to maintain in certain favored localities near the base of Mount Etna an agricultural population of at least 1,000 to the square mile.

Other Exports

Citrate of lime is freely exported to the United States, the quantities exported amounting to 2,206 metric tons out of a total of 3,458 metric tons. This commodity is nothing more than crude lemon juice preserved in lime; it requires a complex and expensive operation to transform citrate of lime into citric acid. At present there are two citric acid factories operating in Italy; one at Casale in Lombardy and the other in Palermo, Sicily, while a third is in course of construction at Messina. The cost of one of these citric acid plants at the present high prices for construction material is not less than \$1,000,000.

The director of the Camera Agrumaria estimates that 3,000 large casks of 400 kilos each of lemon peel in brine will be exported to the United States during the current year to be used in the making of marmalade. Of the 8,736 metric tons of lemon peel which Italy exported during 1919, 1,087 metric tons were shipped to the United States. Much more important exportations of lemon peel are made to England, which also takes heavy consignments of oranges. Shipments of oranges are also being resumed to Germany, consignments being about equally divided between vessel shipments to Hamburg and Bremen and railway shipments to points in south Germany. It has been stated that a single German concern in Hamburg has recently purchased 300 carloads of cull lemons from Messina. An important by-product of the lemon industry is the oil derived from lemon peel, of which 313 tons were exported to the United States in 1919 out of a total exportation of 758 tons.

The Almond Growers Exchange estimates almond crop from old acreage at only 50 per cent of last year's, tonnage from new plantings uncertain as yet; I. X. L., Ne Plus Ultra and Peerless are especially short.

Why the Waterloo Boy Gives Maximum Power At Drawbar and Belt

The engine of any tractor will deliver its maximum power only when shaft and axle bearings run without friction. Friction means wasted motor energy.

The Waterloo Boy Tractor is equipped with heavy-duty roller bearings. Friction is reduced to the minimum. Engine efficiency is increased. Maximum power is delivered at drawbar and belt.

WATERLOO BOY

BURNS KEROSENE COMPLETELY

Eleven Hyatt roller bearings are used on the Waterloo Boy. Three are on the engine extension shaft which operates the belt pulley, and carries the high and low speed gears. Two are on the intermediate shaft, whose gears transmit tractive power to the differential. Four are on the differential shafts, which drive the tractor, and two on the rear axle, carrying the rear weight of the outfit. These particular bearings have an established reputation for their special ability to reduce friction and conserve power.

The Waterloo Boy engine is placed crosswise on the tractor frame. This eliminates bevel gears. Bevel gears cause friction. Waterloo Boy drive is direct through straight gears, another power-conserving feature.

There are many other superior features of Waterloo Boy construction and operation. Its simplicity and accessibility, its powerful 12-25 H. P. engine, its ability to burn kerosene and burn it right, a pump, fan and radiator cooling system, all contribute to make the Waterloo Boy an especially good tractor for your farm.

We have a booklet describing the Waterloo Boy fully. You will want to read it. Address John Deere, Moline, Illinois, and ask for booklet WB-7.

The small shaded portions in the above illustration show the exact location of the heavy-duty Hyatt bearings on the Waterloo Boy. They reduce friction, thus giving maximum drawbar and belt power. All the gears shown above are enclosed in a dust-proof case, and run in oil.

John Deere Implements, and Waterloo Boy Tractors and Kerosene Engines are distributed from all important trade centers. Sold by John Deere dealers everywhere.

JOHN DEERE

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

Facts!

You cannot deny them.

Motorists buy Zerolene because it is good lubricating oil; because it makes the car last longer.

More than half the motorists of the Pacific Coast states use Zerolene. Such approval is given only as a reward to a product of highest quality.

There is a Zerolene Correct Lubrication Chart for each make of car. Get one for your car at your dealer's or our nearest station. Use Zerolene for the Correct Lubrication of your automobile, truck or tractor.

STANDARD OIL COMPANY
(California)

A grade for each type of engine

Hairbreadth Accuracy

"How can you detect differences in sizes of parts to within the half-thousandth of an inch?" How we do it is told in a booklet "ACCURACY," sent free to those interested in tractors, which shows and describes the marvelous instruments used for this purpose. It explains how Holt high standards produce a long-lived tractor and reduce operating expense to a minimum. Ask for booklet No. 418.

TOP WORKING OLD ORCHARDS

The writer recently spent a half day with Farm Adviser Hodgson in the Chatsworth end of the San Fernando Valley, where he was putting in sample buds and grafts on many kinds of trees. The work was out of season for some trees, but those interested wished to see the work done, that they might know the proper methods when the trees were in receptive condition.

Other orchards were examined for various ills or to observe condition of trees and crops. One of these was the apricot orchard of W. P. Parmentier, the owner of which said: "I came from four brick walls in a big city and knew nothing of fruit trees. One man called and told me how I should prune and treat my trees, very much as I am now treating them. Just eight others said this man was crazy, so I took their advice, believing in majority rule.

"My trees were 'deck pruned,' simply flattened on top, and I got no fruit. Last year I heard of the new long pruning and saw it demonstrated. I recognized then the method suggested by my first adviser and now feel certain the eight men were crazy instead of the one. For last year I pruned rationally and now have a fair crop and can see where next year I should have a large one."

On these trees last year's spurs largely died, believed to be partially due to lack of water, for although it is but ten feet to water, the trees are but seven years old, the soil sandy and free and the root system has not yet reached soil perennially moist.

Mr. Hodgson gave some budding and grafting demonstrations on the old Johnson ranch, occupied by a family of that name for the past 40 years. He said: "Budding is done by inserting single buds underneath the bark of the tree to be changed or worked over, but is not much used except on young trees before the bearing age. It may generally be done whenever the bark will peel and fairly dormant buds may be had. This is in early spring or late summer and is the method practiced in plant nurseries. But for topworking old trees cleft grafting is the usual method, splitting the sawed off branches, inserting one or more wedge shaped scions and waxing over the whole exposed area. With walnuts and some other trees budding is not practiced, even with small trees, but they are whip grafted. Trees girdled by gophers or from other causes may only be saved by bridge grafting." Mr. Hodgson then showed his audience on both orange and apple trees just how the work should be done.—E. B.

JAMAICA ORANGE OIL

The oil of orange industry began to assume importance in Jamaica from 1908 onward after the industry had been temporarily ruined by the earthquake in Sicily, previously the largest producer of essence of citron and orange.

To extract the oil of oranges in Jamaica a shallow copper vessel is used, which is tinned on the inside and furnished with one inch copper nails fixed perpendicularly to the surface of the vessel. At the bottom of the vessel is a hollow in which the oil is collected. The vessel is held between the knees and an orange is rolled on the points, pressing slightly with the open hand; the points rupture the oil cells and the oil flows down into the hollow. The oil is afterwards filtered through a cloth. As the oil obtained in this way often contains a little orange juice and mucilage, it is allowed to stand, then decanted off and filtered. Attempts have been made to devise a mechanical process of extraction, but without success. The method described above requires much care and practice, as the oil cells only should be broken and the points should not penetrate into the orange. The oranges should not be completely ripe or the oil will be too dark colored. The oranges should be gathered and treated in the early morning, as the yield decreases when the fruit is gathered during the hot part of the day.

Lemons have not persistently held down to low prices in the past ten years as they have in the recent two weeks. Best of fruit hardly brings picking, packing and shipping expense.

TEAGUE TREES

Are the Standard For Quality

It Is Not Too Late to Plant Balled Trees

CITRUS TREES

All the commercial varieties of Oranges, Lemons, Limes and Pomeles.

AVOCADOS

Field grown stock of the recommended varieties. Balled in lath house ready for immediate delivery.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

"Curly Leaf"

What is the cause of orange and lemon trees having curly leaves similar to the curly leaf of the peach tree?—Subscriber, Los Altos.

The answer to this question depends upon the form of curl leaf. One type of curling of leaves near the tips, and usually of the young growth, is caused by aphids. These never affect the old and matured leaves. Another form of curl leaf seems to be physiological, or at least there has been discovered no definite cause such as fungous trouble. In this form of curl leaf all the leaves on the branch are usually affected. For this there is no remedy.

Measuring Hay in the Stack

Please give me a rule for measuring hay in the stack.—Subscriber, Terra Bella.

Here is a rule formerly given in the Cultivator which gives opportunity to form fairly close estimate as to quantity of hay in a stack. It must be borne in mind that in measuring hay in the stack or in the barn the time of settling and character of the hay must be considered in reaching any conclusion. At best it is a matter of good judgment. The rule is:

In the measurement of hay there are two points to be considered. These are the number of cubic feet required to make one ton and the method of determining the number of cubic feet in a stack. The following table gives the number of cubic feet required to make one ton of alfalfa at various seasons of settling, these figures being

OAKLAND LIVESTOCK SHOW IS OFF

Late advices are to the effect that the livestock show planned for Oakland has been abandoned owing to the lack of interest and support manifested by the Oakland business interests. For a time it appeared that the show was to become a fact, and the livestock industry of the state was preparing to support the event in every way possible. It is quite certain that had the show been held it would have attracted one of the strongest exhibits ever made in this state.

It seems a great pity that the commercial interests of the Bay region view the proposition of a livestock show with such shortsighted vision. It is a fact capable of ample demonstration that a properly organized and conducted livestock show can be made a great asset to the community sponsoring it. Such shows are primarily educational institutions that go far toward stimulating the production of a more profitable type of livestock. With better livestock comes greater prosperity to the individual engaged in the production, and his prosperity measures, to a very marked degree, the prosperity of the cities. A livestock show is not promoted by the breeders for the one purpose of exhibiting their stock in competition with fellow breeders for the pleasure of winning prizes. Such shows are held with the idea of spreading the doctrine of more efficient methods of production. The commercial interests of Oakland and San Francisco have frittered away a splendid opportunity to stimulate more efficient and economical production in the territory counted as tributary to them. They have rebuffed the producers to whom they are crying for more and cheaper food. They have, in effect, said: "We are in no way interested in your business—you can paddle your own canoes." To all of which the livestock men can reply: "So be it. That is just what we will do. But when decreased production brings about higher food costs, don't come around with a lot of patronizing bunk and tell us how important our business is and that the consuming public regards us as the greatest of all public benefactors, and won't we please hurry up and raise a lot more cattle, hogs and sheep so prices will come down. Don't come to us with that line of chatter—else we might be so rude as to laugh."

Some day times will change. Some day the two Bay cities will have it made painfully plain to them that their interests and those of the big farming and livestock regions are identical and that the progress of each is dependent upon the other. When that day comes a big livestock show will come into existence. Los Angeles and Portland have seen the light and each city has the friendly and active interest of the livestock fraternity.

If aphids is the cause, and it usually shows in the work of the insect, such as smut and skins of departed aphids, then prevention of other leaves curling is secured by eradicating the pest. Tobacco extract or distillate emulsion sprays are effective.

Johnson Grass

How can I best destroy Johnson grass that has a good stand over a 15 acre walnut orchard?—Subscriber, Whittier.

Clean culture is the best way of eradicating any of these weed pests. Where the pest is thoroughly established the first time over, of course, will be expensive, but be sure and cut off the tops, and by repeated effort in this particular, so as to prevent the elaboration of the sap and the formation of footage at the roots, the vitality of the plant is affected and its eradication made comparatively easy.

Spray for Cabbage

Please tell me what spray to use on my cabbage.—Y. Yamoto.

The spray required for any crop depends upon the particular pest attacking it. If desired to treat for aphids, tobacco dust alone will be sufficient, but any of the weaker sprays will accomplish the death of the pest. Especially good is the ordinary kerosene emulsion to which nicotine sulphate is added, one part of the sulphate to every 1,500 parts of the emulsion. For cabbage worm use fairly strong arsenical spray. Never use this spray, however, after cabbage is half grown, because of the danger of poisoning humans. A safe spray is white hellebore, though it is not so effective

accepted as fair amounts to allow for a ton:

Number of days in stack	Number of cubic feet per ton.
30	560
60	540
90	512
120	485
Late winter	450

Native hay packs more closely, the usual figure being 422 cubic feet for one ton in a well settled stack.

There are three general methods of arriving at the number of cubic feet in the stack. All three methods will require the width, length and overmeasurements. The latter is the distance from the ground on one side straight over the top to the ground on the other side. Where stacks are irregular, it is best to secure a number of measurements for width and length and the overmeasurement, and use the average.

Rule 1. One-fourth of the "over" multiplied by the width, then multiplied by the length and divided by the required number of cubic feet to make one ton. This rule gives accurate figures on small, squat stacks when the width is from one-third to one-half of the "over."

Last fall the experiment station bought 98.55 tons by the use of this rule, and when weighed out it weighed 98.18 tons.

Government rule—Width plus "over" divided by four and squared, then multiplied by length and divided by the number of cubic feet required to make one ton. This rule is satisfactory for large tall stacks of 25 to 45 tons, and favors the seller with ordinary small squat stacks.—T. E. Leiper, Colorado Agricultural College.

Veterinary

Removing Foxtail From Cow's Eye

In the veterinary column of the July 10 Cultivator a Dorris subscriber inquired about the eye trouble of a cow and as the description is the same as that in a puppy I have, I thought perhaps my experience might help. The puppy had a very bad eye that appeared to be rotting out, and at times large quantities of pus would work out and the eye appeared to be half gone. Had looked for foxtail but found nothing until a friend told me to put a pinch of sugar in the eye. I did so and almost instantly the foxtail showed up and I got it out and the eye was sound and well in a few days. Since then I have used a few grains of sugar in the eyes of baby chicks and have never failed to get the barley beard or whatever it was. If the Dorris subscriber will throw a handful of sugar in the cow's eye, I believe it will do the work. Anyway, it is worth a trial. I have had help through your paper and like to help others, if I can.

Scours in Horse

Horse has diarrhoea which persists in spite of change in feed. Has continued for more than six months. Please give treatment.—Subscriber.

The condition may be due to different causes. Some horses are predisposed to scour and in cases of this kind it is rather difficult to prescribe treatment. It may also exist as a complication of other diseases. One common cause is faulty condition of the teeth and another is an infection in the intestinal tract. Faulty feed may also cause this condition by irritating the intestines. It is probably well to start the treatment by administering about a quart of raw linseed oil. Somewhat less than the quart will probably be administered if the operator is not skilled. If the animal is not receiving good feed, it should be changed. The horse's teeth should be looked after by a veterinarian and if found faulty they should be floated. In case the trouble persists after the

above mentioned treatment and you are sure the horse is being properly fed and watered, you may administer the following: Wheat flour in water, or starch water. It is well to consult a veterinarian before attempting to administer any drugs.

Fails to Breed

Cow 12 years old I expected would freshen in June now proves not to be with calf. Has been milking year and a half. Neighbors think she needs treatment for barrenness. Will it pay to keep her and try to breed? She will be dry for several months and feed is very high though I grow most of my own. She was a fine milker.—Subscriber, West Berkeley.

When you find a cow 12 years old and barren probably the best thing to do is to fatten her and send her to the butcher, unless she is an exceptionally good animal. The cost of feed at the present time is quite high and unless you have especially cheap pasture the cost of keeping her over would be impractical. There is no doubt that she would need some treatment for the barrenness and you will have to consult a veterinarian and have him administer such treatment in case you desire to keep her.

Bloody Milk

Our heifer has been giving just a trace of bloody milk out of the left front teat. This one is a little longer than others and there seems to be something lumpy near the end. Does not give as much milk, is harder to milk and takes longer than the others. What is the matter and how can we remedy the trouble?—Subscriber, Pomona.

Bloody milk is often caused by a bruise to some portion of the udder or teat. The bruise may also have caused the lump which you mentioned. Sometimes when a cow first freshens and the udder is somewhat distended, blood vessels may be ruptured which will continue to give some trouble. It is possible that a clot of casein may have been formed in the milk ducts, pressed clear of its liquid, and then become lodged in the teat. If the

condition is found to be a bruise, massaging with sweet oil and turpentine and also the application of hot and cold cloths applied intermittently will probably relieve it. If the teat is blocked by casein or a foreign substance it can be removed with a teat dilator. This operation, however, should be performed by a veterinarian or someone skilled in the use of such an instrument, as infection inside the teat or udder may be caused very easily in such practice. If the trouble does not clear up under the first mentioned treatment it would be best to consult a veterinarian.

Ringbone

Please give me information regarding the cause and remedy for ringbone. I have a young horse seriously lame. He has been running in pasture since September. He became lame at that time, but I attributed it to tender feet. Lately a swelling and tenderness has developed right under ankle joint. Could it be ringbone? It is below ankle joint on back of leg, between angle joint and hoof.

From your letter it would seem that ringbone is a possible cause of the lameness. Ringbone may develop from several causes, usually, however, a bruise of some kind is responsible for the trouble. The growth ordinarily runs clear around the foot just above the coronet in the form of a ring. Some horses are predisposed toward ringbone through heredity by reason of their conformation. A straight pastern not allowing much "give" when the horse walks will cause soreness to develop in the foot from which irritation ringbone may develop. Sprains may cause it as well as bruises. The best treatment I can recommend for such a condition is a blister. This blister may be made as follows: One ounce Spanish Fly (Cantharidin) powdered, one-half ounce red iodide of mercury, eight ounces vaseline or lard. These substances should be well mixed and rubbed on to the affected part with a rough stone or corncob for four or five minutes. In 24 hours wash this material off with soap and water

and apply a grease such as vaseline or lard. This last application of grease will prevent further irritation and will cause the hair to grow up over the blistered part normally.—G. E. G.

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand and Fleur de Soufre, packed in double

sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men \$5 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill in the soil 110 pounds per acre of TORO BRAND SPECIALLY PREPARED AGRICULTURAL SULPHUR—or our DIAMOND "S" BRAND REFINED POWDERED SULPHUR. This soil treatment has increased various crops up to 500%. Send for Circulars No. 6 and 7, and circular letter of information, "To Whom It May Concern".

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur, Mixtures, etc.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO.
624 California Street, San Francisco, Cal.

We are equipped to make immediate shipments. Send for "ILLUSTRATED BOOKLET"; also booklet "NEW USES FOR SULPHUR," Price-list and Samples.

Third Annual Sale BUTTE CITY RANCH

Owned by W. P. Dwyer and W. S. Guilford

Butte City, Cal., Wednesday, Aug. 11, 1920

60 Registered Shorthorns

105 Registered Shropshire Sheep

20 Registered Berkshires

10 Shetland Ponies

25 of the Registered Shorthorns are consigned by O. L. Raper, Glenn, Cal.

owner of the well known sire, Crescent Dale

THE SHORTHORNS—Will include about 15 good cows with calves at foot, all of breeding age in calf to Victor Stamford, Herman the Great, or Crescent Dale. The offering includes daughters of Hallwood Flash, Vermillion, Sir Type, Crescent Dale, Victor Stamford, Cedarlawn's Best, Victor Stamp, Count Glory, Hallwood Villager, and others of substantial and popular breeding. There will also be a most attractive lot of heifers, both bred and open, and a limited number of good young bulls.

THE SHROPSHIRE—Butte City Ranch has become justly famous for the quality of its registered Shropshires, a flock developed largely from foundation of Broughton, Wardwell and Cavendish breeding, and the present offering will consist of ram and ewe lambs, and breeding ewes that both breeders and beginners can use profitably.

The writer has been familiar with the operations carried on at Butte City Ranch for the last few years and has noted the character of the livestock distributed in the annual sales. There is no hesitation in urging attendance at the forthcoming sale upon any man who is interested in securing livestock, of any of the breeds offered, that has great utility value. The Shorthorns are particularly suited to the man who plans a modest investment and who depends upon his purchases to make him money. The Butte City Ranch Shropshire flock can be rated as one of the best Western flocks. The Berkshires are well bred and have been developed along lines that Guilford is convinced will enable them to make good under average conditions. The ponies are up to the usual standard and the mares will carry the service of General Boggs, perhaps the best representative of the breed owned in California. A visit to the sale will afford an opportunity to know one of the most interesting ranches in Northern California—a ranch that pure bred livestock has literally made.

(Signed) R. P. ROYCE, Livestock Editor, California Cultivator.

Power Farming Brings the Greatest Profit

The farmers of America are appreciating more fully each day the increased profits that come from power farming. The army of Fordson owners now numbers 100,000 and is continually growing in size.

Fordson farming is profitable because it is practical—because the implements are designed for the work which they must do. Whether it is plowing with an Oliver mould-board or disc plow, discing the stubble and the plowed field with the Roderick Lean Automatic Disc Harrow, or seeding with the Amsco Drill—these specially built tools serve best the needs of Fordson farmers.

Throughout the country more than 8,000 Fordson dealers can supply you with these specialized farm implements. The service which they offer you is secondary in value only to the implements themselves, for it is your assurance of the continuous successful operation of your power farming equipment. There can be no costly delays in your farming program with such a nationwide service at your call.

Dispersal of a Choice Herd

50--Registered Holsteins--50

State Fairgrounds Sacramento, Cal.
Thursday, August 26, at 10 a.m.

Some Heifer Calves in the Sale

This is the high class herd owned by Wm. M. Bray, Klamath Falls, Ore., and the necessity for selling arises because the owner's large lumber interests call him to another part of the country.

THE FEMALES

There are 47 females in the sale, the oldest a 7 year old cow with a record above 31 lbs. butter in 7 days as a 4 year old, one four year old, and all of the balance are two and three year olds, bred heifers, and heifer calves. They include several granddaughters of the former world's record milk cow Margie Newman, granddaughters of King of the Pontiacs and King Korndyke Sadie Vale, and a large number are out of dams with records up to over 32 pounds butter in 7 days. All the bred females are in calf to the herd sire

Colony Zarilda Newman

who is by Aaggie Cornucopia Newman, proven son of Margie Newman. The dam of Colony Zarilda Newman is the famous Canadian cow Zarilda Clothilde 3d De Kol, the only cow besides Tilly Alcartra that has produced over 33,000 pounds milk in one year, and she also made 1194 lbs. butter. This great sire is in the sale and should bring out a large number of breeders who can use him. He is just past 5 years old, a splendid individual, a quick, sure breeder, and right in every way. It is only in a dispersal such as this that this bull would be sold.

This entire herd, over six months old, has passed two federal tests without a reactor, and most of the foundation stock originally came from a federal accredited herd.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer.

BERYLWOOD REGISTERED HOLSTEINS

Up-to-date Breeding — Up-to-date Equipment — Up-to-date Methods

SIRE IN SERVICE

The sire selected for service for foundation blood at Berylwood is King Segis Pauline Alcartra 282440

grandson of the famous \$50,000 sire King Segis Pontiac Alcartra. Every dam in pedigree of this promising young sire, except one, is A. R. O. His dam is a daughter of a 36-lb. son of the great Rag Apple Korndyke.

Some Leading Females at Berylwood

An A-1 foundation cow here is the 3-year-old Queen Sadie Vale Veeman Karlay 382920—a daughter of the great King Korndyke Sadie Vale 27th, backed by numerous 40-lb. records. This fine young cow has just completed a seven-day record of 30.11 lbs. butter from 547.4 lbs. of milk and is still going along strong. She has yearling daughter by King Marco Alcartra, and likewise a fine bull calf by the herd bull, 14 nearest dams of this young bull averaging 28.83. This most promising young matron of the herd is now booked to be bred to service of King Korndyke Pontiac 20th.

An outstanding show heifer, and one of our highly valued females, is Fay Tritonia Hengerveld Walker 411140—noted as an A. R. O. daughter of Prince Riverside Walker. Every dam in her pedigree is A. R. O. At 2 years she made in 7 days 348.90 lbs. milk and 17.11 lbs. butter. When she freshens will be put on yearly test. She will be seen at the shows this fall.

Summer Night of Sunnyside 385410 is a 4-year-old daughter of Judge Hengerveld De Kol. She has made a record in 7 days from two teats only of 395.5 lbs. milk and 15.2 lbs. butter. Has great young bull calf got by our herd sire.

Emma Palmyre Longfield is a very promising young daughter of Sir Aaggie Longfield. She is every inch a show cow, and her 2-months-old bull calf by herd sire is one of our fine sale prospects. His dam is to go on yearly test at next freshening.

Miss Bracelet Fobes Korndyke 446085 at 2 years and 6 months, six months after calving, made in 7 days from 389 lbs. milk 12.4 lbs. butter. This young daughter of Mutual Fobes Longfield De Kol will be an excellent yearly prospect when she freshens again.

A Business Proposition

The Berylwood management is undertaking to build up a great herd of registered Holstein cattle, primarily if not purely in the interest of dairying in the state of California. Incidentally we shall have a few high class young bulls to offer the buying public. We cordially invite inspection at all times. Visitors always welcome.

Hueneme, Ventura Co., Cal.

THE NEED OF A BETTER LIVE-STOCK PROGRAM

(Continued from Page 123.)

cations as any other man—except, perhaps, he is a hit more patient—he neither asks nor expects anything other than a fair return for his labor and investment. Really, what would suit him best is to be assured of a stable, even market representing a fair profit. He would like nothing better than to feel reasonably certain that his market from season to season and year to year would be such that he could plan ahead with some degree of assurance. And undoubtedly such a situation would best suit the public.

Admitting the importance of stability in livestock production, it is no small matter to control the factors that make for stabilization. Stability depends upon a balance between production and demand, and such balance can best be maintained under conditions where the producer is assured a fair profit and the cost price to the consumer is such that he can buy freely and in such quantities as to at all times take care of the supply.

In working to that basis both parties—the producer and consumer—must be willing to meet on common ground and to exert equal strength against the middlemen in an effort to prevent in the future such conditions as we herewith cite. Since 1914 the cost of producing meat, milk and wool has constantly increased. Likewise has the curvy of prices to the consumer shown an almost constant upward trend. Yet the prices paid the producer have shown marked fluctuations. Indeed, there is evidence to show that the periods of loss to the producer have been of greater extent than the periods of profit. An easy case in point is that of pork. Since the middle of 1917 there has been but one time, a period during the first half of 1919, when a profit could be claimed for the pork producer. During the last half of 1919, and to the present time, the pork producers have, according to a 13 year chart prepared by Wallace's Farmer, suffered the heaviest loss recorded in 13 years. During that time wholesale prices have fluctuated but a trifle, and retail prices have failed to show any tendency to follow the downward curve of prices paid for pork on foot. Bacon, ham and pork chops cost the consumer as much, or more, than during the high periods in 1917 and 1919. According to the chart referred to, the profit to the pork producer for a short time in 1917 went as high as \$3 per hundred and at the peak of the profit period in 1919 around \$2.75 per hundred was recorded. During the whole year of 1918 hogs were marketed at a loss on the Chicago market, the greatest loss touching near \$6 per hundred, a point almost approached on the 1920 June market. Now, a fluctuation from a profit point of around \$2.75 to a loss of over \$5 per hundred represents a spread of near \$8. We do not have the actual figures at hand covering the retail prices, but we leave it to our readers as to whether their butcher shop bill for pork products has shown a similar cut.

The steer chart prepared by the same Iowa paper as referred to above shows an almost identical situation during the last 13 years. A period of profit touching as high as \$22 or \$23 per steer was recorded in 1917 and again in early 1919. Since the forepart of 1919 until the present time steers at Chicago have fluctuated on the loss side until Wallace's Farmer charges that steers on the June market lost the feeders as much as \$56.40 per head.

Butter prices charted show but one period of profit, and that period very limited, in 1919, since 1916.

In considering the above statements it should be kept in mind that the figures cover average production, a fact that is of tremendous importance to the public. If the average producer is not making a profit it is certain that production will be restricted through liquidation until a point is reached where prices will be forced to a profit point through the law of supply and demand.

Such a state of affairs governing any primary business is obviously unsatisfactory to all concerned. Somehow we all must work toward a stabilized price era. How such stabilization can be accomplished is a problem that cannot be solved in a short time. Years of careful effort on the

part of producers, consumers and distributors will be required. But as a starting point several suggestions can be considered.

The consuming public must come to understand the problems of the producer. The consumer must realize that meat, milk and wool represent certain definite costs to the producer that can in a measure be expressed in terms representing the value of feed, labor, investment and risk. The public must come to appreciate that raw food production is as much business as any commercial enterprise and that such being the case, the producer is entitled to the same consideration as any other business man. He must be accorded reasonable financial credit to conduct his business, and because his operations necessarily are dependent on long seasons, such credit as is made available should be on a long term basis. The evil of short credit is tremendous, and the public will never know the losses that the livestock producer has suffered by reason of short loans that have been called at critical times. That menace should be removed. It is also to the interest of the consumer that the livestock producer be given the benefits of an uncontrolled market. The distributor must be satisfied with legitimate profits, else he can rest assured that a way will be found to eliminate him. As long as any distributing agency conducts its business efficiently and legitimately, neither the producer nor consumer will object. There are other suggestions that could be offered, but the writer is more concerned with the problems of the producer.

If the producer will glance at the reproduced charts, he will be struck with the fact that over a period of years his business is subject to quite regular but sometimes violent fluctuations. It has been true in the past and it is likely to continue for a number of years to come. The shrewd business producer should bear that

Selling Purebred Holstein Cattle is Profitable

Do you realize that purebred Holstein calves bring a very liberal price? Every day this breed is becoming more and more known. Breeders are telling the public about the value of the milk. The demand today for purebred Holsteins is greater than the supply. Here is opportunity for you to get rich. Hundreds of calves every year are sold from \$100 to \$200 apiece. With plenty of food and ordinary care these cattle will average from 350 to 500 lbs. of butter per year. Can you see opportunity here? Remember, "Holsteins are the most profitable cattle."

Save Money—Buy Pipe From Us

Farmers, Miners, Builders—people in every kind of business are saving money buying used or renewed pipe from us. We sell every kind of pipe. Send in a list of your requirements today and get our prices. We have saved hundreds of people 33 1-3 to 50% on their pipe bills. Here's a partial list of some of the miles of pipe we have in stock for immediate delivery:

8000 ft.	6-inch Riveted	16 gauge
700 ft.	8-inch Riveted	16 gauge
5000 ft.	12-inch Riveted	12 gauge
1000 ft.	18-inch Riveted	12 gauge
800 ft.	22-inch Riveted	14 gauge
300 ft.	24-inch Riveted	14 gauge
500 ft.	36-inch Riveted	12 gauge
10,000 feet	light wrought iron 8-inch pipe with cast iron collars.	

All above pipe thoroughly overhauled and inspected and ready for immediate use.

We also have large quantity standard pipe and screw casing, pressure tested and guaranteed.

Don't delay—write for our prices on your pipe requirements today.

Sales made any time and any place. Write for sale dates, we can fill them.
Clark, Hunter & Clark Modesto, Cal.

fact in mind and order his business so that he can take advantage of such conditions.

In preparing to take such advantage there is a valuable and sound viewpoint to catch and hold. First, he is engaged in a fundamental business, a business that will endure. Second, the average man engaged in livestock production is in no way different from the average man engaged in any other line of effort—if he makes a profit it is small. The livestock man who makes a profit, like the man in any other industry, is the man who sticks to his business year in and year out and who has raised himself to a point above the average—has become more efficient than the average.

While the average livestock man has the same right as any other average man to demand conditions that will make it possible for him to register a profit, he has no greater right. If the livestock producers are to go before the public with demands that will enable them to secure a just price for their products, it is well to bear in mind that the public has an equal right to demand efficiency at the hands of the producer. If the producer is to demand stabilized markets, fair prices and satisfactory credit, the public has the right to expect that the producer will exert himself to employ the most efficient methods of production.

Third. Notwithstanding the fact that the charts indicate that on the average the livestock producers have not been making a reasonable profit, we know that during the years there are men who have made money in the livestock business. Such men are in every community and they have demonstrated their ability. Inquiry as to how these men have succeeded reveals no secret. Nine times out of ten they are men who have applied modern methods to their business. They are men who have studied their business. They know that there is a difference in livestock. They have purchased or bred a class of livestock that is capable of making more efficient utilization of feed. They are the men who, through the use of better hulls and hoars, are turning off livestock that weigh more and milk more than the common run. If John Jones has a herd of cows that averages 400 pounds of fat a year and Jim Smith has a herd that averages 150 pounds, which man is in a position to go before the public and demand a fair price? The public cannot accuse Jones of being inefficient; but what can Smith say?

The public cannot be expected to put a premium on or have patience with inefficiency.

The writer trusts that he will not be charged with failing to appreciate the present situation, but because he believes so strongly that a change is bound to come wherein a more satisfactory condition will prevail, he wants to urge that the livestock interests as a whole begin to set their house in order so that when the showdown comes the consuming public cannot make a charge of inefficiency against the rank and file of the livestock men.

Let us recognize the fact that we are facing a new set of conditions; that our labor, feed bills and investment will probably never get back to a pre-war basis. In other words, let us not try to meet 1920 and future conditions with 1914 methods. Let us cooperate in every way possible to better our business. Let us modernize our methods along with our demands for fair profits.

SONOMA TO OPEN FAIR CIRCUIT

The 1920 fair season will be opened August 23 at Santa Rosa with the holding of the Sonoma County fair. President J. Francis O'Connor and Secretary H. J. Walters report that all preparations have been completed and there is every indication of heavy entries in all departments. Sonoma County has one of the most complete and attractive fair grounds in the state, but for the last few years no fair has been held. The discontinuance of the annual fair left a distinct vacancy in the agricultural activities of the county, and last spring, a plan for rejuvenating the fair association was started. An effective plan of financing was developed and a most progressive set of officers elected and given orders to put the fair across in the most approved manner. The grounds have been improved, the track put in shape and the grand stand enlarged.

Every branch of agricultural production has been provided for with generous premiums, and a great many special features not usually found at county fairs have been introduced. The fair will continue a full week and the management declares there will not be a dull day. A complete showing of livestock from several counties is assured. There will be four days of exceptionally good racing, one of automobile racing and one of motorcycle and speed events. A full program of night horse show classes has been provided. There will also be two days of rodeo stunts. During the week there will be staged a dog show, a tractor show, an apple show and an egg show, in addition to the regular horticultural classes.

J. I. Thompson, formerly with the college of agriculture, will judge swine, and Senator Ben F. Rush of Suisun will place the beef cattle classes.

THIRTY POUND RECORD AT BERYLWOOD

Queen Sadie Vale Veeman Karlay, the three year old daughter of King Korndyke Sadie Vale 27th, owned by the Berylwood Investment Company, Hueneme, has just completed a record of 30.11 pounds butter from 547.4 pounds of milk in seven days. This new record makes her the first thirty pound daughter of her sire. Manager

Snodgrass states that she is still going strong and that she will be carried on yearly test. It is planned by Mr. Snodgrass to carry all of their cows on yearly test and at the same time to make use of the seven day and 30 day tests. It is of interest to know that in the Berylwood herd is a yearling daughter of Queen Sadie Vale Veeman Karlay by King Marco Alcartra, and a promising son sired by their herd bull, King Segis Pauline Alcartra. She will soon be bred to the \$12,000 King Korndyke Pontiac 20th, owned by Burr Farm, Los Angeles. It is the intention of the owners of Berylwood herd to make it one of the strong herds of this state, and already a very fine start has been made.

THE LAMB DISPERSAL SALE

By J. P. Bennett

The dispersion sale of Duroc-Jersey hogs held by Elmer Lamb, Ceres, on Wednesday, July 21, was not so well attended nor so well supported as it should have been. Owing to conditions the entire offering was not sold.

The top of the sale was the great sow Mary Jane Pathfinder, going to C. O. Talbot, Turlock, at \$1,000. She was the bargain of the sale, and to show the value of such a sow six of her pigs of various ages were sold for an average of close to \$220 each.

The good herd boar Orion Cherry Pathfinder, a son of Mary Jane Path-

finder, went to Ordway & Snyder Hughson, at \$500, a very conservative figure for such a promising young boar.

Among the heaviest buyers were H. A. Stelmerjohan, Turlock; Allen Thompson, Tulare; E. G. Stone, Modesto; and W. E. Way, Modesto. The animals sold brought an average of \$152.50.

Col. C. N. Clark, Modesto, assisted by Cols. Hunter and C. N. Clark Jr., was on the block and handled the sale in a very able manner.

Following is a list of representative sales:

1. Ordway & Snyder, Hughson, \$500.
2. W. E. Way, Modesto, \$150.
3. C. E. Talbot, Turlock, \$1,000.
4. H. A. Stelmerjohan, Turlock, \$220.
5. H. E. Cornwell, Modesto, \$80.
6. H. A. Stelmerjohan, \$85.
7. V. F. Dolcini, Davis, \$100.
8. E. G. Stone, Modesto, \$65.
9. E. G. Stone, \$60.
10. W. E. Way, \$205.
11. E. G. Stone, \$65.
12. W. E. Smith, Hughson, \$89.
13. E. G. Stone, \$75.
14. W. S. Parker, Modesto, \$85.
15. W. S. Parker, Modesto, \$75.
16. C. D. Hayworth, Modesto, \$80.
17. R. J. Johan, Atwater, \$75.
18. W. W. Winn, Modesto, \$65.
19. H. A. Stelmerjohan, \$150.
20. H. E. Stone, Modesto, \$105.
21. H. A. Stelmerjohan, \$150.
22. Allen Thompson, Tulare, \$125.
23. Witherow & Stafford, Live Oak, \$95.
24. C. Busingdal, Patterson, \$100.
25. C. E. Talbot, \$145.

Stanislaus County will make a \$2,000 exhibit at the state fair.

To the Dairymen and Stockmen of California:

THE future holds bright prospects for the man who has the grit and ability to stay in the dairy business in this state.

The world is crying for beef and dairy products. The demand exceeds the supply. Higher prices are in sight. The business dairyman will be shrewd enough to grasp this opportunity.

The big problem now, is how to reduce feeding costs, but where there's a will there's a way. It can be done.

Confronted by a general hay shortage and unprecedented prices for hay, it behooves every dairyman to conserve to the utmost the available supply and utilize to the fullest extent the feeding value of the entire hay crop.

Therein lies the key to a reduction of feed costs.

Last March the University of Idaho completed a series of feeding tests which proved that chopping alfalfa hay increases its feeding value 25%.

The cattle used in the test, which lasted 100 days, belonged to the Lemp Livestock Company and were fed under a guaranteed spread.

Four groups of cattle were fed four different rations in which long hay was used. Four other groups were fed similar rations in which chopped hay was used.

The test proved that 57 tons of chopped hay were equivalent in feeding value to 75 tons of long hay, a saving of 18 tons, or about 25%. The saving in dollars and cents amounts to \$450, with alfalfa worth \$25 in the stack. It cost only \$1.25 a ton to chop it.

We will be pleased to mail a complete summary of the tests upon request.

The future of the De Laval Dairy Supply Company is inseparably allied with the growth of the Dairy Industry in California and while it is the business of one of our departments to sell machines for chopping hay and filling silos (the Acme Cutter) we feel it our duty to give publicity to these reliable feeding tests, that all dairymen may derive full benefit from them and each apply the results to his own work if he is so disposed.

The cost of the machine is soon recovered in the saving effected by chopping the hay. The Acme is a general purpose feed cutter—a combined silo filler, hay chopper and alfalfa meal machine. Request for description of the Acme Cutter and suggestions for handling chopped hay incurs no obligation.

Yours truly,

De Laval Dairy Supply Co.
61 Beale Street, San Francisco, Cal.

Lendorris Liberty Bond, Skyrocket and Lendorris Liberator

Three good sons of three good sires are our herd boars. We will have a few representatives of our herd on exhibit at the state fair. When in need of choice Poland China breeding stock, write for our prices. You will find them very reasonable.

W. L. Haag and Son Hanford, Cal.

Do You Know?

That The Westerner is a half brother to the sire of Caldwell's Big Bob, Grand Champion at the National Swine Show in 1917.

The Westerner heads a herd of sows that have no superior on the western coast.

Remember our big public sale Sept. 27th. It will be an event in Poland China circles.

ALEX. D. McCARTY RIVERINA FARMS MODESTO, CAL.

THE SEQUOIAN

A yearling Poland China boar of strictly big type breeding that carries the size, stretch and quality so much desired by the breeder and feeder.

Write for prices and information on most anything in the way of breeding stock.

Z. M. Dickey Dinuba, Cal.

The Buckland Herd of Poland Chinas

Breeding of distinction characterizes our herd. Careful personal attention to each individual insures a class of breeding stock which is one of the many reasons for our growing business. Your patronage is solicited.

A. Buckland & Son, R.F.D., Fresno, Cal.

Trewhitt's Big Type Polands

Are the result of careful mating and selection. Size and feeding quality have always been essential features in this herd. Write for prices and information. I can interest you.

W. D. Trewhitt Hanford, Cal.

King's Big Bone Leader

A Grand Champion, and Glant Bob 2nd, a son of last year's Grand Champion, are my herd boars. They are siring a high class of Poland Chinas. Write for prices and information.

The Forrestview Herd of Polands

I am now located on my new place near Chico, where I am better prepared than ever to care for my customers. My intention is to raise more and better Poland Chinas in the future.

J. H. Cook Route 4, Chico, Cal.

The Feeding Problem

THE feeder is confronted by a most serious problem and he is bravely trying to solve it. In a word it is this:

How can a dollar's worth of feed be turned into a dollar's worth of beef or pork and leave a reasonable profit to the producer? Can he supplement some of the more expensive feeds with cheaper feeds which will let him by with a little chance for his life? Or, again, can he take the feeds already at hand and make the nutrients more available and more completely assimilable by the animal? Is it possible to use root crops or pumpkins, soiling crops or pasture which through giving succulency secure better appetite and more complete assimilation? Or may feed be cut and thus reduced to a more available form and may we add to this feed stock molasses or other appetizers?

Because of these questions and

eight equal groups were fed on eight different rations for a period of 100 days preceding March 15. The cattle belonged to the Lemp Livestock Company of Boise, and were fed under a guaranteed spread. They were weighed for three successive days at the beginning, and at the end of the period, and the average of the three weighings taken as the designated weight. The general average gain was 1.48 pounds per day. It required an average of 25 pounds of hay to produce one pound of gain.

Hay Consumed

Long hay consumed amounted to 75.75 tons; chopped hay, 71.4 tons; gain on long hay, 6,561.6 pounds; gain on chopped hay, 7,722.6 pounds; difference in favor of chopped hay, 1,161 pounds.

This difference in weight gained is equivalent to 14½ tons of hay. There

many others, solution of which seems equally impossible, which are being asked, we feel there is help for the feeder in the results of a feeding test conducted by the University of Idaho.

Certain it is, the reports of the tests in the table above indicate that cutting of hay adds materially to its feeding value. It has also been claimed that by adding molasses to a feed as low in nutrients as is rice straw, the feeder may at least prolong the life of the animals if not increase their weight.

The summary as given out by the university says but little of the conclusions of those who conducted the test, but the figures are given in full and in such a way as to be enlightening to the stock feeder.

The Tests as Reported by the University

The tests were based on the amount of hay consumed with various rations as compared with the gain in weight of the cattle. In beef cattle the food value of the hay goes into bone and flesh; in mature dairy cattle it maintains life and milk production.

Ninety-six head of stock divided into

were, however 4¼ less tons of cut hay fed during the test, which makes the actual balance in favor of chopped hay equal to 18¾ tons, or 25 per cent, of the amount of long hay consumed. In other words, the gain in weight through the feeding of 75.75 tons of long hay as distributed through the various rations could have been accomplished by using only 57 tons of chopped hay.

Brought Out by the Test

The average daily gain per animal on long hay was 1.14 pounds; on chopped hay, 1.42 pounds. Average daily gains were greater using cut hay in any ration than using long hay in the same ration.

The lowest cost per 100 pounds of gain was made on the cut alfalfa and silage ration.

Cut hay, silage and barley brought its group of stock through in the best condition and was among the three cheapest rations.

On total hay consumption of only 75 tons, the amount of money actually saved by chopping was \$304, figuring alfalfa at the unusually low price of \$16.25 per ton. It cost only \$1.25 per ton to chop it.

Value of Official Dairy Tests

The system of advanced registration has been of great value to breeders of dairy cattle, particularly from a financial standpoint and as an aid in their breeding operations, reports the Missouri college of agriculture. It is profitable financially because a good record not only greatly increases the value of the cow herself and of her offspring, but of all closely related stock as well. Further, it provides authentic information upon which the selection of animals for breeding purposes can intelligently be made, and gives definite proof of improvement that is made through selection and breeding. Official tests also raise the standard of each of the dairy breeds and increase their popularity.

Do you want to cull the boarders? The first discovery after beginning the test will probably be that some of your cows are not paying for their feed and care. This is not a pleasant discovery but it is profitable information. It is not good business to keep a pure bred cow that will not exceed the requirements for admission to the ad-

vanced registry with proper feed and care, nor is it profitable to continue to breed animals of inferior ability.

Do you want to feed your cows more economically? Everyone who has to buy feed at the high prices prevailing is interested in the amount of feed the cows will profitably utilize. With exact milk and fat records more economical feeding according to the requirements of individuals will be made. It is true that many large records are made without regard to feed cost, but a good record can be made economically, since it is well known that the feed eaten above maintenance is the real productive feed for milk production.

Do you want to select your breeding stock intelligently? Improvement in stock of any kind depends upon the careful mating of the best animals. The trained eye can judge the true-ness of breed type and conformation, but the actual productive ability is determined by test alone. The only sure and impartial judges of production are the milk scale and the Babcock tester. Much is said about cows

being bred for production. An authen-
tic record of the productive ability of
each animal in the herd means an of-
ficial record. The future productive-
ness of the herd is assured if the se-
lection of the heifers from the best
cows is made on the basis of the of-
ficial test.

Do you want to determine the value
of your bull? Test your herd sire.
You spent considerable time and
money in buying and selecting him,
but do you know whether he is in-
creasing or decreasing the value of
your herd? He is the better half of
the herd if his daughters are better
producers than their dams. If he is
the better half, after you are through
someone else will gladly purchase
him. A bull with known prepotency
is an asset both to your herd and to
the breed which he represents.

Do you want to demonstrate the
merits of your herd? You may know
that your herd is capable of large re-
cords, but buyers are not willing to
pay high prices for the stock on your
"say so." They want to be shown.
There is nothing that will bring such
favorable attention to your herd as a
number of good records. It will dem-
onstrate beyond question the merit of
your herd.

These and many other questions
will be answered if you will begin
official testing in your herd. The re-
sult of testing will be to increase the
selling price of the cows and their off-
spring.

BERKSHIRES TOP THE MARKET

By Bruce S. Bennett

Berkshire breeders have always
maintained the superiority of Berk-
shires as feeding animals. Those who
have been raising and feeding Berk-
shires have been pleased with the
results. W. S. Corsa, a leading Berk-
shire breeder and feeder, recently re-
ceived from Clay, Robinson & Com-
pany the following letter: "We had
about 8,000 hogs on sale today and
the market was a little lower with
a top of \$14.75. However, we were
able to sell your load of Berkshires
for \$14.90, which was 15 cents more
than anything else sold for today."

This is just another instance of the
ability of the Berkshire to top the
market. That every farmer may have
the opportunity to secure some good
Berkshires, the Southwestern Berk-
shire Congress will hold a public sale
of bred Berkshire sows and gilts at
the D. J. Bastanchury Ranch, La
Habra, Saturday, August 14. It is ex-
pected that a large number of farmers
will be in attendance with the view
of securing one or more of these Berk-
shires with the ability to make satis-
factory gain under any and all condi-
tions and on most any kind of feed.
The sale will be preceded by a big
free dinner.

BEEF IMPORTS FOR 1920 SHOW SLIGHT INCREASE OVER 1919

There was very little difference in
the quantity of fresh and refrigerated
beef imported into the United States
in 1919 and 1920. The figures are
taken from the meat inspectors' re-
ports, bureau of animal industry,
United States department of agricul-
ture. In ten months ending in April,
1919, 27,673,105 pounds of fresh and
refrigerated beef were imported. In
the period ending at the correspond-
ing time in 1920 the quantity of fresh
and refrigerated beef arriving in the
United States from foreign countries
was 27,968,880 pounds, an increase of
about a quarter of a million pounds.

Fresh and refrigerated meats of
other kinds jumped to twice the quan-
tity in the ten months ending April,
1920, as for the same period in 1919.
The figures show 7,933,377 pounds for
1919 and 14,979,663 pounds for 1920.
But the canned and cured meats im-
ported during the same periods show
a remarkable drop from 126,624,348
pounds in 1919 to less than 2,000,000
pounds in 1920. This item accounts
for the marked decrease in the total
meat products imported. The total
weight imported in the 1919 period
was 168,602,911 pounds, but 1920
brought only 50,246,655 pounds.

It is much better policy to make re-
pairs when they are first needed
rather than to wait until more exten-
sive ones are needed. There is a
satisfaction in having one's belongings
in good shape and small repairs are
less expensive to make than larger
ones.

TESTIMONIALS

"Cows increased in one week 3 per cent in milk."

A. L. McCULLOCH, Alpaugh, Cal.

"I never saw hogs do so well or grow so fast as on this molasses
ration."

C. H. HARTWIG, Yuba City, Cal.

"It has enabled me to keep my stock in better condition at less ex-
pense."

J. M. HENDERSON, JR., Sacramento, Cal.

"Have one calf that refuses to drink new milk—prefers skim milk
with molasses. What do you know about that?"

R. HECKLEY, Santa Rosa, Cal.

"It has been a great advantage in getting the stock to clean up the
roughage."

H. H. AMES, Chowchilla, Cal.

"One cow will turn down the choicest handfuls of alfalfa hay unless
it has been 'Molassed'."

REDWOOD AYRSHIRE FARM, La Honda, Cal.

SERIES OF POULTRY CULLING DEMONSTRATIONS

The agricultural extension service, representing the University of California and the United States department of agriculture, has made arrangements to have R. B. Easson, extension poultry specialist of the University of California, for a series of culling demonstrations under the auspices of the Los Angeles County farm bureau. Mr. Easson will cull flocks at these demonstrations on which egg production records will be kept preceding and following the demonstration, thereby showing an absolute check on the advantages of culling. The demonstrations will be held: Monday, August 2, 10 a. m., at place of S. R. Elston, Vineland, at Baldwin Park; August 3, at 10 a. m., at place of John D. Cockran, one and one-half miles north of Downey on Los Angeles Boulevard; August 3, 2 p. m., place of C. C. Ockerman, Signal Hill, about two miles north of Long Beach on Hermosa Street between Burnett and Crescent Avenues; August 4, 10 a. m., place of L. G. Hack, 3255 North Fair Oaks Avenue, Pasadena; August 5, 10 a. m., place of T. C. Dwire, Third Street, Lankershim; August 9, 10 a. m., place of Mrs. Ben Long, Gardena; August 10, 10 a. m., place of C. Pearson, Helen Street, Hansen Heights; August 12, 10 a. m., Fuller & McAllister Ranch, corner Greville and Hardy Streets, Inglewood; August 13, 10 a. m., place of J. D. Zimmerman, San Gabriel Boulevard, three blocks north of Masonic Home, San Gabriel.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

By Max Kortum, Manager

R. C. Gibson of Newhall wins for the week with a count of 53 eggs, this being six eggs over his closest competitor. The flock as a whole is beginning to weaken with the gradual approach of the molt. At present out of the 338 contesting hens 274 are laying. These laid the past week 1,270 eggs, this being an average for the whole flock of 53½ per cent for the seven days.

On account of knowing just what each hen is doing it may be of interest to those who are culling out molters and broody hens at this time of the year to demonstrate what would happen to the contest flock under this procedure. Of the 64 hens that are not laying, 52 would be discarded by a good culler according to their present condition. This would give 286 hens the credit for the 1,270 eggs for the week, making the percentage average 63.4, or just about ten points higher than what it is.

High pens for the week are: Gibson, 53 eggs; Wood, 47; Neef, 36; Enterprise, 44; Tullett, 44; Gray, 44; Stalling, 43; Barker, 43; Bellows, 42; Peck, 42.

AMERICAN EGG LAYING CONTEST

By Russell F. Palmer

All doubt as to whether or not the choice quality exhibition females in the American Egg Laying Contest held at Leavenworth, Kansas, would continue to uphold the reputation and fact already established that pullets of exhibition quality would lay a profitable number of eggs, has been practically dispelled by the highly creditable record made to date by the 270 females in the contest. During the month of June a very high average production was recorded, and especially was this true of the lighter weight breeds that are not so much inclined to broodiness.

Ten Highest Pens for Eight Months

S. C. White Leghorn, Pennsylvania, 886 eggs; Rhode Island White, Kentucky, 850; S. C. White Leghorn, Iowa, 826; S. C. White Leghorn, Texas, 809; White Wyandotte, Pennsylvania, 801; S. C. White Leghorn, Washington, 786; S. C. White Leghorn, Illinois, 772; S. C. White Leghorn, England, 772; S. C. White Leghorn, Missouri, 762; S. C. White Leghorn, New York, 761.

Ten Highest Pens for June

S. C. White Leghorn, Kansas, 124 eggs; S. C. White Leghorn, Kansas,

122; S. C. White Leghorn, New York, 121; S. C. White Leghorn, Iowa, 120; Rhode Island White, Kentucky, 119; S. C. White Leghorn, Iowa, 119; S. C. White Leghorn, Nebraska, 118; S. C. White Leghorn, Pennsylvania, 118; S. C. White Leghorn, Michigan, 117; S. C. White Leghorn, Pennsylvania, 115.

THE KAURI PINE

The superintendent of forestry in the Hawaiian Islands states in a recent official report that the kauri pine, *Agathis australis*, is "the most promising and widely useful tree for planting in the Hawaiian Islands." This tree has been planted there up to the present only as an ornamental and in very limited numbers. The same is true in California. It is not generally known but thrives well in the southern third of the state and at a satisfactory rate of growth. It is noted for shooting upward rather than for trunk diameter. So far as climatic conditions are a factor it appears to thrive as well in California as in Hawaii, where the water supply has been equal, for the report states "the average growth is one inch in diameter every four and three-quarter years." It grows faster in California.

Skagit County, Washington, fair August 9-14.

SONG

Hark, how sweet the thrushes sing!
Hark, how clear the robins call!
Chorus of the happy spring,
Summer's madrigal!

Flood the world with joy and cheer,
O ye birds, and pour your song
Till the farthest distance hear
Notes so glad and strong!

Storm the earth with odors sweet,
O ye flowers, that blaze in light;
Crowd about June's shining feet,
All ye blossoms bright.

Shout, ye waters, to the sun.
Back are winter's fetters hurled;
Summer's glory is begun;
Beauty holds the world!

—Celia Thaxter.

A HOUSE FOR RENT

DADDY, what does 'H-o-u-s-i-n-g' spell?" Little Judith Proctor leaned against her father's elbow and laboriously spelled out the headlines of the morning paper propped up beside his coffee cup.

"Housing Problem Grows Acute," read her father. "That means, Pussy, that you'd better be glad you've got a corner—lots of people are having trouble finding homes these days."

"Indeed they are!" Mrs. Proctor echoed. "People are walking up and down the streets begging for houses to rent."

"Why don't you rent them this and getting a whopping big price for it?" grinned Randall.

"And where would we live?" Sam, the older boy, put in.

"What's the matter with the garage on the back lot?" Randall inquired. "Then you'd be rich enough to send me to Moosehead Camp next summer, wouldn't you, father?"

Mr. Proctor looked thoughtfully at the alert youngster, and then he said with a touch of regret, "It is too bad that I can't give you that trip, Ran, but it would cost more than a hundred dollars, and I can't afford it."

"I like Ran's nerve—proposing that all the family camp in the garage just so that he can go to Moosehead Camp next summer with that military academy bunch."

Sam spoke a little sorely. It had been his ambition to go to the academy at Hewson this year, but financial trouble had overtaken his father and he had been obliged to content himself with the less attractive high school.

The Moosehead Camp, which represented the goal of Ran's ambition, was a summer recreation scheme managed by Major Mallard, commandant of the academy, and so popular was it proving that boys from all over that section of country flocked to it.

"The garage isn't such a bad place," Ran insisted; "it has an upstairs."

"A loft, you mean!" interposed Sam. "And steps going up to it."

"And they are as steep as a ladder!"

"The windows and doors are fine, and that hydrant in the back."

"Let me go and live there!" begged Judith, fired by Randall's enthusiasm.

"I don't see any prospect of our using it for automobiles at present," said their father ruefully, "but I don't think we need come down to living there ourselves—just yet."

Mrs. Proctor changed the subject deftly, but Ran's mind was filled with his unique idea.

"Come on, Sam," he urged as they left the table; "let's go and take a look at the place."

Rather reluctantly Sam accompanied him. "You're crazy, Ran," he said. "What difference does it make if the garage is fit to live in? You know we are not going out there."

"No, but maybe we could fix it up so that somebody else would want to." Ran lowered his voice as he shared his great idea. "If folks are as bad off for houses as the paper says, I should think they'd be glad of the chance."

He threw open the wide doors and stepped into the empty, echoing place. It was an unusually clean, snug building, with an excellent floor, and windows well spaced and of good size. No automobile had been kept there for several years, and only a few odds and ends of garden equipment were stored in the place. A small flight of steep steps ran up from the back of the building to the loft above, and

there was a convenient water tap under the stairway.

"You see, Sam, we could clean it all up, stain the floors, and hang curtains at the windows. I know mother would let us have the furniture that is stored in the cellar."

Sam put out a protesting hand. "Hold on! Don't go so fast! Let's see what it really looks like in here," and he began a careful exploration of the place. At the end of an hour the two emerged, all differences lost sight of in the absorption of their plan. This they proceeded to lay before their mother. She was amused at first, but as she listened to the boys' argument she was almost won over by the prospect.

Their father was harder to convince, but after a thorough canvass of the situation, he gave his consent.

"You may go ahead, boys, on condition that you rent the place through a reputable house agent, who will give references as to the tenants' respectability. It will need a little fixing first, though. Will twenty-five dollars see you through? I doubt your finding a tenant, however, so I am unwilling to spend more."

Twenty-five dollars seemed a fortune to Ran, and an adequate supply even to the more experienced Sam; but this was before they made a round of the paint shops and inquired the prices of stains and varnishes.

Still, by dint of hard work and a good deal of help from their mother, they managed to revolutionize the appearance of the garage. A fortnight later it was ready for a tenant.

The floor was stained a light brown around the edges of the two porch rugs which Mrs. Proctor loaned them for the first floor of the building.

"They are summer rugs," she said, "and it won't hurt them much more to be spread out there than to be stuffed away in our cellar. Those curtains of Aunt Mary's I never have needed, because they didn't suit our windows."

They suited the garage windows wonderfully, the two promoters thought, and indeed the plain scrim draperies looked fresh and clean enough for any home. Aunt Mary's rather embarrassing legacy of furniture—not old enough to be quaint, not modern enough to combine with Mrs. Proctor's—had crowded the cellar for two years; now Sam and Ran, carried it down, piece by piece, to the new establishment.

Odd? Of course it was! The lower floor must serve as dining and living room, while a screen hid the kitchen, pantry and storeroom equipment in the rear. The upper floor was divided off into separate "apartments" by means of several sets of Aunt Mary's brown portieres.

The building had no porch, but the doorway opened on a slope of smooth ground a dozen yards from the side road, and the view of the wooded hills encircling the town was far better, Mr. Proctor declared, than anything to be seen from his front veranda.

When all was in order, the boys went to the real estate offices of Wakely and Benning and offered their house for rent.

"Let me do the talking," Sam argued; "they'll think it is a joke if you tell them what we have done."

Sam displayed considerable dexterity in his address: "Mr. Wakely, have you anyone on your list of renters that would like a different sort of house from the ordinary—a kind of free and easy and artistic place?"

"If you'll show me any kind of house for rent in this town, young man," the harrassed agent replied promptly, "I'll take care of the tastes of the renter."

Sam told their plan, finding it difficult, of course, to overcome Mr. Wakely's impatient incredulity. But before the hour was over the boys had induced him to go with them to see their property.

"How about heating?" he grunted, concealing his genuine amazement at what they had accomplished.

"There's a place for a stove here at the back," Sam told him.

"And we saw one at Miller's second-hand place for ten dollars," squeaked Randall irrepressibly.

"The tenant could install that," Mr. Wakely relented. "Boys' this isn't a bad bit of work, and I believe I can get you a tenant. Now about the rent. Would \$25 do? You see, whoever

comes in will have to use oil lamps, and I'm afraid you couldn't ask more for it."

Sam gave Ran a surreptitious kick. "That will do," he said with dignity, while the younger boy stepped out of the back door to turn a joyful hand-spring.

"That would be \$300 a year!" Ran shouted when the agent had gone. "We could pay Mr. Wakely something, give back Dad's \$25, keep a little for fun, and still get a hundred dollars out of it for camp next summer, and enough to help pay your tuition fee at the academy. Whoop-la!"

"You haven't got the brain of an ostrich, Ran. The money will come in month by month; we won't have it all to spend in a lump," Sam reminded him.

But both boys were jubilant, agreeing not to say anything at home until Mr. Wakely's tenant was actually in hand.

"Anything to do down at your house today?" asked their father at breakfast the next morning.

"I'm going to take the pushcart and go over to Haley's Branch for clean sand and pebbles this afternoon," Ran answered promptly. "We want to make a path to the side road, dad."

"I am going to stay around and finish up things," Sam said vaguely; as a matter of fact he wished to be within reach in case Mr. Wakely should return.

So Ran set off alone with his cart and shovel.

(Continued next week.)

THIS WEEK'S PATTERNS

A dainty little girl's dress of white batiste or lawn with lace edging and insertion is shown in 3123. The work and time put on such a little frock are well spent, for when it is outgrown the long, full skirt may be dropped to the waist line and used for another summer or two.

Of quite a different style is the plain little dress in 3141, charming and practical for a pongee, for instance. The loop hutton holes and sash run under the little side pockets are distinctive. A touch of brown and orange or lavender and black or blue and red in the simple outline of knots or running stitch as indicated around neck, sleeves and pockets, is an addition any child will love.

3307 is a graceful, simple gown, always becoming.

3306 shows the new lines with long waisted effect and pretty touch of embroidery.

3293 is a practical and pretty house dress.

Note the little outline of pattern for apron 3122. Simple, isn't it, and delightful when it comes to the ironing board.

Eton jacket effects are quite the thing again, very dainty and attractive for the slight figure and capable of individual distinctive handling.

The ducky little apron dress and sunbonnet to match of cretonne or gay English print, shown in 3285, involve practically no dressmaking and are sweet and effective.—R. P. D.

HOUSEHOLD QUERIES

Sweet Pickle Recipe Wanted

Mrs. J. W. M. of Fresno writes: "Will you kindly publish in your household column a request for home-made sweet pickle recipes? I have found all the recipes that I have tried from Cultivator contributors to be good and so I am appealing to you for what I cannot find elsewhere."

The Cultivator will be glad to receive such recipes and will pay in extension of subscription for all published.

To Keep Corn White

Here is a suggestion worth remembering and trying, brought in by a Cultivator reader:

When boiling corn on the cob, if some ears turn yellow, just before removing from the pot drop in a little vinegar—a tablespoon or two to a large kettle will be ample—and the more attractive white color will instantly return.

Easy Pickles

Somewhere I saw recipe for "easy pickles." I think they were put up just in cold vinegar and had a little mustard.—Subscriber, Turlock.

The very best pickles we ever ate

were made in this way and we have just telephoned to the friend who made them for her recipe. Here it is:

Pack perfectly fresh small cucumbers in quart jars. Fill jars with vinegar, add to each jar one tablespoon sugar, one tablespoon salt, one tablespoon mustard. Put on rubber rings and screw on covers. Set away in cool, dark, dry place.

Those we tasted had been in jars for two years and were crisp and fine.

SUMMER VEGETABLES FROM YOUR OWN GARDEN

Chard

Chard grows so quickly that it seems one has only set out the plants when the thick succulent stalks and leaves are ready for greens and for creaming. Most people tire quickly of the leaves as greens, but like the thick stalks cut in two inch pieces with cream dressing added in which has been dissolved a little cheese for seasoning. A little cooked pimento or pepper cut up in the cream sauce is a toothsome addition, as are bits of left over ham, bacon or tongue.

The cooked stalks chilled for salad are also much liked. Serve as asparagus, alone or with other salad vegetables.

Leaves and stalks cut up together may be served as greens. Melt in kettle a little fat—drippings are good. When beginning to sizzle drop in cut up leaves and stalks, previously washed, of course, with moisture adhering, into the pot. Put on cover and steam five minutes or so, as long as you dare for fear of burning. Then add just a little boiling water, cover and steam again, adding a second and third time if necessary. The chard cooks much more quickly this way than when started in water alone, and has more flavor and freshness.

This quick method of cooking green vegetables was recommended in the Cultivator years ago by a Santa Ana subscriber and has been a great help to many of us.

Chard stalks and onions creamed together are also good.

Green Beans

Green beans may be cooked very quickly in the way suggested above. The addition of the fat helps to preserve the green color and prevent boiling over or burning to the bottom of kettle. The colored woman who sometimes helps me clean house says: "It's a scan'al the way they cook beans out here in California. Beans ain't worth eating unless they're cooked two hours anyway with meat." "Meat," of course, to a colored woman means bacon, salt pork or ham. Those of us who were raised on Southern cooking are half inclined to second her opinion, but "new days, new ways."

My own bean patch is a delight this summer, to the eye as well as the palate, for I recklessly scattered a packet of Scarlet Runner seeds with the Kentucky Wonders, and the glowing blossoms are a joy. One can pick them with stems a foot long or more, and many an embryo bean has gone into the flower howl on my breakfast table. The green beans are perfectly good eating, cooked with the Kentucky Wonders, or, a little more mature, as shell beans add richness to the green ones.

Summer Squash

Summer squash, if steamed or prepared in the manner above described, is less insipid than when boiled. Another good way of preparing is to boil, preferably steam, tender the young whole squashes. With teaspoon make a cup in the blossom end, mashing the removed portion with butter or drippings, salt, pepper, grated cheese and milk or chopped bits of meat. Fill the squashes with this mixture and place in baking pans and slip into the oven until slightly browned.

Broiled Corn

Fresh corn may be broiled over a gas flame, if placed in ordinary toaster and turned carefully to avoid scorching. This way of cooking keeps in all juices and sweetness. Of course you've broiled corn over your camp fire and know that nothing can quite equal it, but try it at home.

Corn cut from the cob and fried with green peppers is another worth trying.

Peppers—Tomatoes Stuffed

Stuffed green peppers or tomatoes are especially appetizing for hot days.

We like better to partly cook the peppers before stuffing. The stuffing materials vary with the left overs, but if possible add a little corn. The crisp grains counteract the general mushiness of the ordinary stuffing. Try dried bread crumbs, drippings, corn and bits of meat well seasoned with salt and pepper, with perhaps a tiny bit of cheese melted on top.

Baked Tomatoes

Cut off stem ends of large smooth tomatoes, removing enough of the center to hold an egg broken into it. Salt and pepper egg and bake in medium oven until white is set.

Green Tomatoes Fried

Not really green tomatoes, but just beginning to turn yellow, so that they are firm and meaty. Slice and dip in beaten egg, then in cracker crumbs that have been well salted and peppered, and fry rather quickly.—R. P. D.

HOUSEKEEPING HELPS

By Martha

At this season of the year, spots of iron rust and mildew are often found on table linen and white goods, and they are hard to take out unless removed as soon as discovered. I have found the best and simplest way of removing iron rust is to tie a generous pinch of cream of tartar in each spot and boil. This is harmless and effective. For mildew, rub on plenty of soft soap and salt, then hang out on the line in the sun and air for a few days.

When you buy a broom, toughen the straw by immersing it in strong salt water for several hours, then keep the straw clean by washing frequently in hot suds.

To make good lemon marmalade, soak peel of lemon left from making lemonade, changing water twice a day to extract the bitter. Boil till soft, then mash and put in enough sugar to make it pleasant to the taste; stew a short time, put in a bowl and cut in slices for the table.

If an orange is placed in a box of fresh cookies, it will impart to them a most delicate flavor.

The day before wash day it is fine to prepare some liquid soap by dissolving a handful of borax soap chips in a pint of boiling water, then in the morning stir enough of this in a tub of warm water to make a good suds. Put in the white clothes and let soak for several hours, then the goods will be softened and whitened and will only need a little soap rubbed on the most soiled spots, and you will find that they need very little rubbing and the cloth is not injured in any way.

To keep the refrigerator in a sanitary condition make a hot suds with a little of the dissolved soap and use this for cleaning it out two or three times a week. And to keep the glassware, dishes and silver shining clean, try washing through this suds and rinsing through clear hot water.

A little thin cold starch rubbed over windows and mirrors, allowed to dry and then wiped off with a soft cloth is an easy way of producing most shining results.

PAINT PROLONGS LIFE

The varnish on the carpet sweeper soon wears off. Unprotected as it then is from moisture and variations in temperature, it is likely to fall to pieces. This can easily be prevented by applying a coat of stain finish, obtainable at any paint store, whenever the machine shows the need of it.

Washing machines should also be protected from variations of temperature and moisture. When the original finish shows signs of wear apply a coat of colored enamel.

A little attention to these details on the part of housewives will prolong the life of utensils or utilities which cost considerable money to replace nowadays.

DID THE DOG KNOW?

The Frenchman did not like the looks of the barking dog harrasing his way.

"It's all right," said the host. "Don't you know the proverb, 'Barking dogs don't bite?'"

"Ah, yes," said the Frenchman, "I know ze proverb, you know ze proverbe, does he know ze proverbe?"

**ARIZONA CERTIFIED
ALFALFA SEED**

This certifies that the alfalfa
field of Morton
located in Yuma Valley
has been examined by me in
cooperation with other rep-
resentatives of the Arizona
Experiment Station and that
this field is commercially pure
Hairy Peruvian

No warranty is given as to
identity, purity or viability of
this seed.

J. W. Longstreth
County Agricultural Agent,
Yuma.

Yuma Valley al-
falfa seed is noted
for its quality.

The crop this year
is very short, less
than one-half nor-
mal.

You should order
now, not only for
this reason but to
get it pure from
the grower.

We Guarantee Identity of Every Sack. Grower's Initials on Each Sack.
Fields Personally Inspected by J. W. Longstreth.

erate, movement limited, market dull, lit-
tle change in prices. Carloads f. o. b.

usual terms: White Orange and White
sage, 19@20; Light Amber Sage, 17½@
18½; Light Amber Alfalfa, 16½@17½;

Hawaiian Light Amber, 15½.

Hamilton & Menderson, July 7, in West-

ern Honey Bee: Honey market disor-
ganized, through the reduction in price
at New York by a Los Angeles marketing
association. Prices to producers: White
orange and sage, 18½@19; light amber
sage, 16@17; light amber alfalfa, 16.
Comb honey—So little offered as not to
make a market. Beeswax, 40.

A. I. Root Co., July 5, Western Honey
Bee: The honey market is still quiet.
The demands of Eastern markets are be-
low normal. Prices paid to producers:
Comb honey, approximately 6.50 per case
of 24 sections. Very little offered. Ex-
tracted—Amber, 15; light amber, 16@17;
water-white orange, 19. Beeswax — 38
cash, 40 in trade.

BEANS

California Lima Bean Growers Associa-
tion reports, under date of July 26:

There has been no appreciable change
in the Lima bean market condition dur-
ing the past three or four weeks. Buy-
ing continues slow and consumption is
reported relatively light in most distrib-
uting markets, with the explanation that
it is believed supply of green fruits and
vegetables is affecting the consumption
of dry beans. It is anticipated that re-
newed consumer demand will develop in
the South next month with the com-
mencement of the cotton harvesting sea-
son. It is evident that the real warm
weather which prevailed over Southern
California during the period from the 15th
to the 23rd did considerable damage to
Lima beans in all the nonirrigated dis-
tricts and has appreciably reduced the
previous crop prospects. The exact ex-
tent of this damage cannot yet be deter-
mined.

GRAIN AND FEEDS

A little weaker, especially in spot stuff.
There is a great range in price because of
vast difference in quality.

Grain Exch. prices bid July 28:

Corn: Yellow, No. 2, bulk, 3.12½.

Barley: Carlots, 2.60@2.63½.

Kafir: Eastern No. 3, 2.70.

Milo: Eastern No. 3, bulk, 2.72½.

Milo: No. 3, bulk, 2.71½.

BEANS AND PEAS

California Bean Growers Association, San Francisco
There has been no material change in the California bean market since our last report to you and we do not look for much activity until the latter part of this month or, perhaps, next month. Quite a little interest has been shown recently in California Pinks but the White varieties have been very inactive. The trade here is offering for shipment at about the following prices:
Large Whites6.15¢@6.30
Small Whites5.75¢@6.10
Pinks6.65¢@6.75
Cranberries6.75¢@7.00
Black Eyes8.25¢@8.50
Red Mexicans8.25¢@8.50
Red Kidneys14.00¢@14.50
Bayos10.25¢@10.50

HOPS

1919 crop, 85¢@1.00 per lb. Prices to growers for 1920 crop, 65¢@80 per lb.

HONEY

Reported by Rafael & Wing in Western Honey Bee July 5:
Small lots of honey are beginning to arrive, and prices show a tendency to weaken. Buyers are buying only for their immediate needs. Reports from different Valley points tend to show that the crop will be much better than last season. Bees are in better condition than at the same time last year. Several large lots of Hawaiian honey are offered, with no takers.

Prices to producers as follows: White orange, 20; light amber orange, 18¢@18½; light amber alfalfa, 16¢@17; amber, 14¢@15; Beeswax, 40¢@42.

GRAIN

Wheat: 4.20¢@4.35.
Oats: Red feed, 3.00¢@3.15.
Corn: California Yellow, 3.65¢@3.75 per cental; California milo maize, 3.50¢@3.65.
Barley: No. 1 feed, 2.75¢@2.85.

HAY

Under date of July 24, A. W. Scott Co. says:
Receipts past week 2,838 tons. San Francisco market still has almost no movement. Most of the arrivals are for immediate consumption. Throughout the country reports are that some farmers are storing in public warehouses, but the majority of hay producers are still hoping to sell before the rains.

We quote today wholesale prices in carload lots (old crop) as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.)

Citrus Markets

Los Angeles, July 28, 1920.

Valencias are still selling at very satisfactory prices. The auctions are not showing as high prices as last week. In fact there have been no sales reaching the \$10 mark this week. The slight easing of the market has probably been caused by the very liberal shipments.

There still remain on trees around 5,000 cars which is hardly sufficient for supplying the market until Navel is ready. It now appears that the Navel from the Tulare district will be a rather short crop, this because of the excessively heavy June drop.

As to lemons there is no market. Imports great and flooding every Eastern market.

Shipments

Shipments of oranges to date from Southern California since November 1, 1919: Oranges, 25,772 cars; lemons, 6,500; total, 32,272. To same date last season: Oranges, 28,736; lemons, 8,243; total, 36,979. From Central California to date this season: Oranges, 5,375; lemons, 288; total, 5,663. To same date last season: Oranges, 3,714; lemons, 251; total, 3,965. Northern California this season: Oranges, 261; lemons, 23; total, 284. To same date last season: Oranges, 244; lemons, 2; total, 246.

Working Parts Easily and Quickly Reached

This is a leading feature with the Best Tracklayer. Every tractor owner will recognize at once the advantage of having the working parts of his machine within easy reach at all times. Particularly when he is in the middle of a big job. By the diagram above and the corresponding explanations below, we show how the principal working parts of the Best Tracklayer can be reached within a few moments with very little effort.

- 1 At the rear is a large port through which, when opened, the main bevel gears connecting main drive shaft and cross shaft can be easily reached.
- 2 Main drive pinions may be removed through the inspection ports in the sprocket wheel. This corresponds to a full-floating rear axle on an automobile.
- 3 On the side plates of rear housing are hand holes, one on each side of tractor, the covers for which are removed by turning a single hand screw. Through these holes the multiple disc steering clutches are quickly reached. If required, the entire side plates can be removed by unscrewing the bolts, which takes but a short time, as space above plates is perfectly clear for free action with a wrench.

- 4 Transmission gears and bearings are fully exposed by removing top plate of transmission housing to which is attached small oil tank. This is quickly done as bolt heads are clear of all encumbrances and pipe connections to tank consist of two easily detached unions.
- 5 Main Clutch is "dry" and hence needs no housing. Parts are therefore reached instantly.
- 6 Extra large inspection ports in the crank case enable you to make bearing adjustments easily and to remove pistons and connecting rods without "tearing down" anything or disturbing valve mechanism.
- 7 Rocker arms may be inspected by lifting hood placed over top of cylinders.

All other working parts of the Best Tracklayer are as readily accessible. But accessibility is just one of many features which have made the Best Tracklayer famous. These features are described in a catalog which we will be pleased to send you. If you are interested in tractors, send for it.

Opinions about Tires should be Weighed as well as Counted

The tire on the left illustrates the cause of about 75 per cent of all tire trouble—insufficient inflation.

The pressure recommended by the manufacturer of your tire is the best to follow—and it cannot be estimated by kicking the tire or punching it. The regular use of a reliable air gauge is the best safeguard against punctures, rim cutting and fabric breakdown.

THERE is hardly a motorist who hasn't at some time or other in his experience had a tire dealer attempt to sell him a tire by representing it as the fastest seller in town.

More attempts are probably made to sell tires by playing to the motorist's alleged weakness for "crowd of buyers" than by any other known method of selling.

* * *

The *experienced* motorist, of course, refuses to surrender his individual judgment to any crowd or mass of whatever size.

Too often he has seen the results of accepting

opinions at their face value, without first finding out *what they are based on.*

And you will find him going more and more to the dealer who has something to offer in support of his tires other than "crowds of buyers" and "numbers of sales."

* * *

The opinion in favor of U. S. Tires is not based solely on the number of them in use.

Great as that number is, it is due to something besides clever arguments.

Thousands of motorists today are putting up with second choice tires be-

cause forced production is *inconsistent with U. S. standard of quality.*

The United States Rubber Company's enormous investment—greater than that of any concern in the industry—has always been aimed *solely* at quality.

Building a *tire* first and a market afterwards. Thinking of the *individual user* instead of the number of sales.

One of the reasons, perhaps, why there is now a scarcity of U. S. Tires.

* * *

If the time ever comes when U. S. Tires can be supplied to all, or nearly all, of the people who want them, they will still have *more to recommend them* than merely the largest following.

A Sacramento Valley Lemon Packing House

A STORAGE house which maintains in its lemon rooms slight variation in temperature and humidity, while temperature outside shows a range of 50 or 60 degrees, is sure to attract some attention. Especially is this the case when it is known that the temperature and humidity are both under almost perfect con-

A Model Little House for the Packing of Lemons

Lemons from 740 acres of Colusa and Glenn Counties are packed through this house. Thoroughly up to date equipment is a feature.

trol and without the use of an ounce of ice and without refrigeration pipes.

Such a plant and packing house is located on the western side of the Sacramento Valley, up almost to the Glenn County line, though in Maxwell, Colusa County.

Interior of Hallway Supplying Air to Store Rooms

The humidifier is located just above the ceiling and from it the air is brought into this room and through doors shown at the side near the ceiling conveyed into the lemon room.

It is in the Mills orchards and is under direct supervision of D. B. Macoun, who has been with this orchard since the planting of the first nursery trees less than a dozen years ago. There are 740 acres on this ranch planted to lemons, 40 to oranges and about 20 to grapefruit—and it is luscious grapefruit. The lemons are filled with juice, are waxy and high class in appearance and are commanding most satisfactory sales even in these times, when the Mediterranean lemon covers the country.

The method of handling these lemons is very similar to that followed by other lemon houses, excepting that conditions in the Sacramento Valley call for special preparation of the storeroom. These rooms are arranged on either side of the long hall-like room shown in photo. The air for the rooms is supplied from this hallway after coming through the humidifier located above. This, in a word, is a series of blankets suspended from a water tank

Every Lemon Is Thoroughly Washed and Cleansed

No matter how clean the fruit may be it is all sent through the washer as soon as delivered from the orchard. After draining the fruit is trucked to the store rooms.

in such a way that through capillarity the moisture is drawn down the entire length of the wool blanket, perhaps three or four feet. These blankets hang close to each other and parallel. At one end of this humidifier a large electric fan sends a blast of air over the blankets, taking from them moisture and reducing the temperature. One standing in line with this current of air is almost chilled. This cooled, and to a degree moisture laden, air is then carried to the lemon store rooms.

This house is in charge of Mr. Foss, since the early 80's a worker in California lemons. (Continued on Page 154.)

One Dollar Yearly

In the Meat and Cattle Trade

By A. L. Spellmeyer

CATTLE have shown no great reaction in price and continue at low levels. Demand is making hog prices stronger but not on a basis to encourage feeders with present grain prices. Lambs are stronger and low stock in the city is causing advanced prices.

A Los Angeles meat war is foretold as the probable outcome of present conditions. The bulk killing seems to be changing from packers to independents as the competition appears too strenuous for the old liners on present margins and the retailers are both prosperous and independent with their great gross percentage on present meat sales. About the only way an adjustment to former killing proportions seems possible may come from two methods, one, control through heavier financing of feeder supply and the feed districts through direct purchase or contracted cattle, the other, cutting of meat to retailers below possible margin the independent can meet.

It is stated that the Oakland retail meat market has been shot to bits by Chinamen and others cutting margins and that the San Francisco independent kill exceeds the line packer kill in that city. There are signs of nearby markets jumping the prices now charged by city retailers with the exception of some of the cash down markets, which cut on limited quantities of certain meat cuts. It is logical that present gross cannot continue and that some source will be established in the near future either in large cash markets under producers' patronage, development of municipal marketing, which is advocated by many stockmen now, or in direct breaks among the retailer association ranks.

Most men thoroughly realize that a

condition cannot continue with producers losing 30 per cent and consumers paying prices based on 60 to 80 per cent gross retail percentage on meat.

In this city today carcass beef steers can be bought at 15 to 18 cents, cows from 12 to 16, veal from 15 to 21, and I have seen carcass heifers, but good eating meat, which wouldn't bring 11 cents carcass price, and heavy calves, almost baby beef, which brought 13. Lambs today are bringing carcass 26 to 27 cents. It is claimed many retailers are cutting 35 to 40 cents from top steer carcass beef, and anyone knows what prices they pay. Meat on a fact basis allowing old time percentages of 20 to 25 per cent retail should not be cutting out over 22 cents for top steer beef nor 15 cents for top common cow beef. Retailers would claim such margin impossible, but the actual producer of those cattle is not even permitted any profit and is today selling his cattle at prices which mean great loss over actual cost and expense, forgetting even interest returns on his money.

It is plain to anyone who figures two and two make four that an economic condition such as exists now cannot continue very long.

A number of men figure stockyards under free management would prevent such a situation as arose this spring and summer and that men would come from all over to take these young heifers and steers which had no market and which were forced to killing pens, and I know of hundreds of twos heifers and young steers which actually did not net killed \$40 when their range value under normal prices

should have been \$65 per head in thin condition.

It is rumored that Kern County people sold 500 cows at $8\frac{1}{2}$ Bakersfield and that Hearst people sold some nine cent cows. The steers are fairly well cleaned up in good heavy grades.

However, Southern Arizona is shipping in many carloads of rather inferior cattle and calves which, however, kill white and make meat. The old liners seem badly disorganized. They seem drunk with a thought of power they don't possess. The eight cent steer beef price on anything good turned out a boggy, myth and failure. Many changes are rumored and several affect local management. It will be with regret that we see some of these changes occur, as many men would prefer a little cow sense and change of attitude and have the outfits cooperate with producers to the limit of their managerial power.

To be just to the old liners as far as Los Angeles is concerned, they are today paying the high price for the top steers as compared to independents. It seems a crime that prospective fine business people in many ways cannot compromise their ideas and attitude to A B C economics, stimulate production through a fair profit and forget all this worn out combination and arbitrary methods stuff.

In the Cultivator in the very early spring attention was called to the "pin headed" policy of certain killers in forcing prices below production costs to cattlemen, and the result has been loss of trade, loss of confidence and loss of the bulk which means profit. A month ago I tried to see a certain packer manager. I

wanted to offer him a few calves and some steers, but it would have been an easier job to have picked J. O. himself.

The old stalwart in the cattle trade, Bill Dysart, when he worked for the packers was the most clever little manipulator of this market for many years any market district ever had, but he was always encouraging production. Bill Dysart is today active in cattle trade circles and will be as a pro-producer about as weighty a brain and help as the cow men can get. It was Bill Dysart who built up some of our big men to their present proportions. He is a cow man who ranks with John McCray of Kern County and with judgment that ranks with the cow sense of H. A. Jastro.

There is no activity or demand in stock cattle, and things seem going from bad to worse, but the rock bottom having been already reached, no cattleman cares very much what may come. The banks seem willing to loan on good cattle paper. Neither the Bank of Italy nor the First National and Los Angeles Trust and Savings, both mighty, have so far as one can hear wretched in their support of production of cattle or farms. They have "carried through" and where they demanded protection and curtailment have been fully justified by sound business rules.

It is probable that 20,000 cattle can be fed this winter in Los Angeles if cattle can be secured. A few thousand cattle will go shortly on beet tops, but there will be much beet tops left without cattle to use them, and prospects are for very early rains.

Developments in this state will be interesting to watch during the next year in marketing of cattle and meat circles.

Factors Influencing Fumigation Results

Summary of Paper Presented by R. S. Woglum
at Covina July 15

THERE is much unrest on the part of some growers, particularly in the Charter Oak and Covina districts, over poor results from fumigation, and this dissatisfaction coming at the same time with the widespread use of liquid hydrocyanic acid, has had a tendency to lead many to believe that this new material is a failure. Now, the use of liquid hydrocyanic acid is by no means a failure, but results with it compare favorably with those under other methods in past years. There are a number of important factors that enter into the complex which means effective fumigation, and failure to observe one or more of these is always a reason for a certain amount of poor work. Some of these most important factors are off hatch of scale, temperature conditions, heavy cover crops, resistant scale, insufficient dosage, poor equipment and careless work.

Off Hatch

The black scale is the paramount problem of this district. It has one generation a year and is hatching at

the present time and in most orchards will not be in a condition suitable for fumigation for fully a month. This insect is susceptible to cyanide gas according to age, the youngest insects being easiest to destroy, the adults and eggs most difficult. Therefore, fumigation to be most effective should be at the time insects are immature. This is not always possible, because of "off hatch," and in such cases a double fumigation is necessary. Where a double fumigation is practiced, the first application should be early in the season, as soon as the scale is in condition. The time of the second will depend upon the rapidity of egg deposition and the hatch. If the weather is warm this period of the second fumigation would follow the first by from two to three months.

Temperature

Temperature is an important factor modifying fumigation results. For several years I have noted better re-

sults generally against the black and purple scales in most districts early in the autumn than late in November or December on cold nights. Careful experimental work performed during the past two years has fully confirmed these earlier observations. It is also an outstanding feature in daylight work that the scale kill on the sunward or hot side of the tree is much better than on the shaded side where the temperature is low.

Heavy Cover Crops

The presence of heavy cover crops in an orchard has an important bearing on effective fumigation. This is due to two reasons—first, the tents do not set close to the ground, so permit the escape of gas beneath; and the gas is cooled so low (36-37 degrees below freezing) when it escapes from the nozzle that it in considerable part freezes over the cover crop in its path. This results in an escape from the tent of a large part of that first gas-

fied before the frozen material has become fully evaporated in gas. As a result the desired gas concentration is never attained and poor results follow. Thus it is apparent that heavy cover crops about trees at the time of fumigation should be avoided.

Resistant Scale

Now at Charter Oak there has been much dissatisfaction over black scale control for several years. It is claimed by several, including fumigators as well as inspectors, that in some orchards the scale is with difficulty controlled even under ideal conditions. It has been stated that small back scale escape even at 100 per cent dosage. I know that for most of California a three-fourths schedule will destroy the smaller sizes of black scale, and if this is not the case at Charter Oak it would indicate that the black scale is assuming a role that we have previously recorded only for red scale and then only at Orange and Corona. If it requires a very heavy dosage to destroy the black scale in this district it is then necessary to use such dosage.
(Continued on Page 154.)

Agricultural News Notes of the Pacific Coast

Northern California

Lake County pear growers met July 23 to discuss prices.

Chico, Butte County, is erecting a \$10,000 dehydrating plant.

California Peach Growers, Inc., has established office at Chico.

California will ship over 1,200 cars of fresh Elberta peaches.

Hayward, Alameda County, is planning for a farm products show.

Oroville, Butte County, is now harvesting its greatest peach crop.

A Japanese at Yuba City has been arrested for selling wormy apples.

The cannery at Gridley, Butte County, is now running with about 400 employees.

Tuolumne County farm bureaus are appealing for irrigation of more of her fertile acres.

Commissioner Harney of Yuba County reports a new weed pest of the genus verbenia.

Some of Eldorado County's dry land cherries sold this season as high as 35 cents per pound.

One almond grower of Tuolumne County is planning to plant 100 acres to almonds next season.

Sonoma County is now shipping out Gravensteins under full inspection, every car carrying certificate.

The aerial duck patrol over the rice fields of Glenn and Colusa Counties will be started on August 15.

Another postponement has been secured by the rice growers in the fight for the waters of the Sacramento.

Yuba County fruit growers report "No shortage of labor; some expert workers making \$9 and \$10 per day."

Boys of California are planning to get some of the pig club prizes to be awarded at the California state fair.

The prune growers association maintains early estimate of a 200,000,000 pound output of prunes for the state.

Grape growers of the state have organized a campaign against the Harris state prohibition enforcement law.

Sutter County is picking Tuscan Clings. The county's crop this season will approach a valuation of four millions.

County Commissioner H. E. Woodworth of San Mateo has resigned to accept position in the Philippine Islands.

The California Bean Growers Association will during the next 60 days complete its payments on the 1918 bean crop.

Apple shippers of the Gravenstein growing district of Sonoma County have pledged themselves to bear cost of state inspection.

Horticultural Commissioner Fred Stokes of Lake County reports brisk selling of pears, prices varying from \$70 to \$80 per ton, orchard run.

G. W. Bailey, bacteriologist of Salt Lake City, is visiting the state department of agriculture, making investigation as to state sanitation work.

Secretary Durkee of the chamber of commerce of Chico is appealing for more attention to health and shapeliness of the shade trees in the city.

California will manufacture and bottle grape juice on a scale immensely greater than ever before. The California Wine Association has a plant in Sonoma County of two and a half million gallons capacity.

Central California

San Joaquin Valley cotton growers recently met at Lindsay.

Fish cutters in Monterey packing houses are out on strike.

First crate of cantaloupes shipped from Turlock was sold at \$100.

Dates of the Patterson fair have been changed to August 19 to 21.

Fresno is making substantial improvements on the district fair grounds.

The packing house at Clovis, Fresno County, is now shipping Thompson Seedless.

One Lodi Tokay vineyard of 24 acres has recently sold its crop "on the vines" for \$15,000.

The third quarterly convention of the Farmers Union of the state was held at Modesto, July 29.

Atwater, Merced County, has shipped nearly 700 cars of farm products during the past year.

The city of Modesto has taken over a large tract of land on the west side for fair grounds and athletic fields.

Farm bureau members of Madera, Merced and Stanislaus Counties have organized and incorporated a farm bureau exchange.

The California Bean Growers Association is testing out in court validity of the contracts between growers and the association.

Cattlemen's Association of California is conducting campaign to induce registration on every brand used on cattle in this state.

California Peach Growers Inc. has named prices on peaches for the coming season. They run about 15 per cent over those of 1919.

The Modesto branch of the California Cooperative Canneries expects to be in full swing within a few days, using at least 500 employees.

To aid in the heavier loading campaign which is being waged all over the Pacific Coast, the Southern Pacific Company is offering cash prizes to all agents.

County Bee Inspector Strubel of Santa Cruz has been exonerated of charges of favoritism in barring out new lots of bees that their owners wished to bring into the county.

Turlock is greatly exercised over recent arrival of 1,200 Japanese laborers, and the Modesto Herald refers to a rumor that "the Japanese are here for the purpose of underbidding white labor."

The supervisors of Santa Cruz County are discussing the matter of ordinance calling for appointment of bee inspector and giving him power to restrict importation of colonies of bees from other counties.

Grape growers in session at Fresno recently discussed grape shipping. Dr. Nougaret and F. W. Read of the state department of agriculture were present. Grapes testing less than 17 per cent may not be shipped, that is, excepting Emperor, Gros Colman and Cornichon, which shall not show less than 16 per cent.

The Associated Raisin Company has placed saccharometers for testing sugar content of raisin grapes in its plants at Fowler, Selma, Kingsburg, Parlier, Del Rey, Sanger, Reedley, Dinuba, Clovis, Burness, Blois, Cutler, Hanford, Armona, Oleander, Monmouth. The testing service of the association is free to grower members.

Southern California

Cotton gin at Seeley, Imperial County, ginned its first bale July 26.

Escondido is planning as usual for her big grape day celebration on September 9.

Serious infestation of aphids is reported in the cotton fields of Palo Verde Valley.

The Potato Growers Association of the San Bernardino Valley last week sent out ten carloads.

The Los Angeles County farm bureau is standing solidly behind dairy-men in the milk price rise.

Lists of places have been announced where fire permits may be secured for Santa Barbara national forest.

Cotton pickers from Old Mexico are arriving in the Palo Verde Valley. Picking will soon begin in earnest.

The Honey Growers Cooperative Exchange, with headquarters at Los Angeles, has announced opening price 20 cents.

Los Angeles County farm bureau is making plans for its annual. Last year's was held at the Baldwin Ranch, Santa Anita.

Peach canning has ended at Hemet and canneries are now working on peaches which are coming in several days earlier than usual.

The federal reclamation service has opened an office at El Centro as headquarters for the survey of the proposed all American canal.

The fruit growers of the Costa Mesa-Fairview section of Orange County have organized to build and conduct a wayside market.

Citrus growers of the Escondido district are planning an auto trip through citrus sections of Riverside, Orange, San Bernardino and Los Angeles Counties.

The California Lima Bean Growers Association held a barbecue at Orange County Park, Saturday, July 24. Manager Churchill was one of the principal speakers.

Orange growers of the Grand Terrace section of Riverside are going after the Argentine ants, which they say are destroying the scale parasites in their orchards.

The state market commission has representatives in Imperial Valley to interest growers in an Imperial Valley Marketing Association to handle their crops cooperatively.

The Corona farm center of Riverside County has committee looking after welfare of the members. A poultry culling demonstration is one of the latest activities of the center.

Prices to be paid by beet growers for topping in the Betteravia district of Santa Barbara County have been agreed on. Four tons of beets to the acre will bring \$11.40; ten tons, \$15.

Apricot growers who are members of the State Cooperative Association will receive from 18 to 33 cents a pound for their dried 'cots, according to prices just named by their board of directors.

Riverside County board of supervisors has fixed upon a basis of valuation for taxation on bearing date trees as follows: Deglet Noor, four years old, \$1, with addition of \$2 per year over that age; Perslans, four years old, \$5, with \$1 per year added; seedlings, four years old, \$1, \$1 per year added.

The Coast and General

Hood River has shipped 54 cars of strawberries.

Polk County, Oregon, fair at Dallas, September 9-11.

Southwest Washington fair at Chehalis, August 23-28.

Tillamook County, Oregon, fair at Tillamook, September 14-17.

Maricopa County roads in Arizona are to be posted by the supervisors.

Kings County, Washington, Home Convenience Fair begins today, July 27.

Buyers have been paying on a 16 cent basis for small quantities of dried prunes.

The commercial apple crop of the United States will be greater than that of 1919.

British Columbia reports plums, prunes and cherries only about a 75 per cent crop.

Thurston County, Washington, bee keepers are working to secure a county bee inspector.

Watermelon shipments from Florida are the heaviest ever and will aggregate over 5,000 cars.

The Arizona college of agriculture has promised to carry on some seed growing experiments.

Nevada expects a bumper crop of potatoes this year, practically a million bushels from 6,000 acres.

The Jersey Breeders Association of Clackamas County, Oregon, held its July meeting on the 31st at Sandy.

U. S. Field Agent Kent of the bureau of crop estimates reports Oregon's potato crop at 5,500,000 bushels.

Grays Harbor County Grange has recently purchased a \$30,000 stock of goods of an established mercantile company.

Work is being rushed on new buildings at the Oregon agricultural college, which was abandoned during the war years.

A bill basing rental charges upon the assessed valuation of the property will be introduced in the next Arizona legislature.

The National Onion Association recently met in Canton, Ohio, and adopted grades for onions as recommended by the department of agriculture.

The farm bureau of Sherman County, Oregon, has placed an order for 75,000 gallons of distillate with a California concern. This will be distributed among farmer members.

A good roads program has been adopted in Lane County, Oregon, in furtherance of the improvements inaugurated by a \$2,000,000 bond issue.

Cotton pickers of the Salt River Valley of Arizona have organized and are demanding \$4 per day. Last year they received three cents per pound. This year's request is for full day's pay regardless of ability. A good picker can pick about 100 pounds daily.

Opening of the new Jerome state highway connecting this mining town with Prescott, the county seat, will shorten the time between the two towns to about one and a half hours. It is expected that the road will be opened about August 10. It is said that this will be one of the finest scenic routes in Arizona, which boasts of many that rival the Alps in grandeur.

Dehydration of Fruits

By W. V. Cruess

DURING the past two years interest in the drying of fruits by artificially applied heat has increased to a most remarkable extent. A number of very large installations for the evaporation of both fruits and vegetables have been established; still others are under process of construction. Several of these represent investments of over \$200,000 each. In addition to these very large plants, smaller units costing from \$1,000 to \$25,000 are being built in such numbers that we have been able to keep in touch with but a small proportion of them.

Those smaller plants are being built

In addition to the advantages just outlined the evaporator may be operated independently of the weather. As one evaporator manufacturer has put it, "The sun always shines for the evaporator."

What Constitutes a Good Evaporator

To those who have decided to build an evaporator comes the problem of

at least 300 feet per minute in fan evaporators.

Sixth, the dryer should be fireproof. Hollow tile construction is excellent on this account and is not excessive in cost.

Seventh, and above and beyond all else, see one of the dryers you propose to build under operation for at least 24 hours on a full load. Many builders of evaporators have deceived themselves, and customers as well, by drying a tray or two at a time in demonstrations. Apricots that may be dried in four hours in small lots will require 12 to 48 hours in the same evaporator loaded to capacity. Much of the present dissatisfaction can be traced to this fact.

Dehydration of Grapes

The dehydration of grapes, especially wine grapes, will assume large proportions during the coming season to supply Eastern and foreign markets. A satisfactory grape dryer should dry dipped wine grapes in 15 hours or less. This may be taken as a measure of the dryer's performance.

The results of the university's investigations in the evaporation of grapes are given in full in a recently issued bulletin entitled "The Evaporation of Grapes" (Bulletin 322), by Cruess, Christie and Flossfeder. This may be had free of charge by writing

grapes require dipping to obtain rapid drying. For such grapes a three per cent lye solution, actively boiling, is required. Immersion for 20 to 40 seconds is necessary to check the skins satisfactorily. The dipped grapes must be rinsed in water to remove lye. 3. Sulphuring is not necessary. 4. Screen trays are very objectionable because the dry grapes adhere to the screen with bulldog tenacity, thus increasing the total labor costs about 75 to 100 per cent of that required for trays made with slat bottoms, to which the dried grapes do not adhere. 5. To stem satisfactorily the grapes must be dried to less than ten per cent moisture, but dried wine grapes may carry 20 per cent moisture without spoiling. 6. A temperature of 165 to 170 degrees Fahrenheit may be used safely through the drying period. The grapes are most sensitive to heat when almost dry. During the initial stages of drying temperatures up to 190 degrees Fahrenheit may be used. Grapes dry twice as rapidly at 170 degrees as at 135 to 140 degrees Fahrenheit.

Recent Tests on Apricots

In cooperation with A. W. Christie and F. E. Neer, the writer recently completed an interesting series of tests with the university farm evaporator at Davis on apricots. Some of the results are given herewith: The fruit under average running conditions was dried in from 11 to 14 hours at a temperature of 165 to 170 degrees Fahrenheit. The dryer held approximately three tons of apricots as compared to its capacity of six tons for

Old Way of Drying Fruits

for either one of two purposes—the dehydration (evaporation) of fruits and vegetable to replace the sun dried products, or as an insurance against rain damage, to be used only in years of unfavorable sun drying weather. Until recently practically all fruit evaporators (except those in use for apple drying) belonged to "rain damage insurance" group, but at the present time evaporators for every day use have the center of the stage.

Properly dehydrated or evaporated (these words mean the same thing), fruits are superior in several ways to the sun dried article. They are dried as a rule under more sanitary conditions and therefore carry less dust, etc., and are less subject to insect infestation than the sun dried fruit. They require much less sulphuring and in many cases sulphuring is omitted. Therefore, there is less objection from food faddists to their sulphurous acid content. Dehydration produces fruit with more of the fresh fruit flavor than does sun drying because it is dried more quickly, at higher temperatures and out of contact with the sun.

Dehydrated Muscat grapes possess the full rich flavor of the fresh grapes but do not have the "raisin flavor." It is entirely different from the sun dried product. The same is true of peaches, prunes, pears, apricots and berries. Some who compare the two products prefer the sun cured fruits; others, the dehydrated. "They are different" is probably as much as can be said at present. Less difference is to be found between sun dried and dehydrated prunes than with other fruits. Personally, the writer prefers the dehydrated to the sun dried fruits in all cases.

selection of an efficient and satisfactory machine. The question also arises: "Shall a commercially built machine be purchased or shall a machine be built?"

If a commercially built machine is chosen, the purchaser should investigate to assure himself that he is purchasing an efficient machine.

First of all the drier should not be excessive in cost. Our investigations show that a cost of more than \$750 per green ton capacity per charge of prunes or grapes is excessive.

Secondly, it should be economical to operate both as regards fuel and labor consumption.

Third, it must have an adequate heat supply and ample facilities for distributing that heat to the fruit. More evaporators have failed because of insufficient heat than for any other reason.

Fourth, the heat must be delivered evenly to the fruit in order that all trays in the stack or on the car dry evenly, in order that excessive cost for sorting and rehandling trays shall not result.

Fifth, it must have adequate air circulation. Heat is carried to the fruit in most dryers by air, hence the need of rapid air flow. If it is a fan operated evaporator there should pass through the dryer for every pound of water removed per minute under average conditions at least 1,500 cubic feet of air per minute to furnish the heat required. To carry away the moisture only about one-seventh this amount of air is needed. Some have failed because they have chosen this latter figure for air flow. The speed of air flow across the trays should be

The New Way

College of Agriculture, University of California, Berkeley.

Among the results reported are the following: 1. Sketches and specifications are given for an evaporator to hold six tons of grapes, complete with shed, trays and dipping outfit. The plant will cost about \$3,600. 2. Wine

grapes or prunes. Green colored apricots dried in the sun became yellow during drying; the same fruit in the evaporator retained its green color—a possible objection. One hour's sulphuring was sufficient for the fruit dried in the evaporator. Three to five hours time was required for the

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

KEEP THOSE BONDS

Liberty Bonds are still holding around 85 to 90, according to the particular issue, but they are, or ultimately will be, worth their full face value. Hence, why worry? Buy more bonds to put with them.

They are a good three in one: Good income; tax exemption; perfect safety.

PEAR DAY

All the Antelope Valley pear belt is celebrating with Littlerock on Saturday of this week. It is Pear Day. There are thousands of acres of pears in this valley, but Littlerock has the distinction of having the largest number of bearing trees. A lunch will be served to all attendants. There will be a program, and, best of all, a taste of Antelope Valley fruits will remain because of cartons of the fruit which will be given to the attendants. There are some 5,000 acres of Bartlett pears in the pear belt of this rich valley, and the enthusiastic boosters are saying: "It will be but a short time before we will be shipping 2,500 carloads of pears."

INCREASING ITS SCOPE

The stockholders of the California Nurserymen's Bud Selection

Association met last week in San Francisco and took steps to increase the influence and the usefulness of the association. A great work has been started and members felt that it should include representatives of the entire fruit growing industry. The name now is California Bud Selection Association, and fruit growers will join nurserymen in the work of the association and receive of its benefits. Manager L. B. Scott will make but slight modifications from former working plans.

LEMON BULLETINS

The bureau of plant industry of the U. S. D. A. is issuing two bulletins, or Professional Papers, having especial value for the lemon grower. Bulletin 813, in the Citrus Fruit Improvement Series, is "A Study of Bud Variation in the Eureka Lemon," written by A. D. Shamel, L. B. Scott, C. S. Pomeroy and C. L. Dyer. The companion paper is Bulletin 815, in the same series and by the same authors, "A Study of Bud Variation in the Lisbon Lemon." Bulletins in this series are sold at a nominal price and may be secured by application to Superintendent of Public Documents, Government Printing Office, Washington, D. C., at 25 cents each.

Under "The Importance of the Lemon Industry" the statement is made: "The total production in all states in 1909 was 2,770,313 boxes, of which California produced 2,756,221 boxes. In other words, California is the whole story in producing American lemons. In 1887 the state's output was 12 cars. This increased till in 1917 the output aggregated 7,915 cars."

BETTER FINANCE

There is still a material difference between the price the farmer must pay for capital to use to increase his business and the price which the manufacturer or dealer must pay. If the merchant is securing money at six per cent presumably the farmer is paying eight. The difference was even greater than that in the Middle West a few years ago. Today the consideration given to agricultural paper by the federal reserve bank has aided materially in securing this improved condition. There is opportunity for even more improvement, and if the hungry world is to be fed this improvement must be brought about.

Large manufacturers of farm power and implements are endeavoring to put their industries on a more satisfactory basis. This necessitates still more handling of farm paper. The necessity is not so apparent here, however, as with cattle paper. The wool grower is also in need of more capital than is now possible.

Guff and flattery have ceased to be stock in trade. Simply a chance to make a living and a little money is expected by the producer. If he doesn't get it he ceases to produce.

MUST HAVE LUXURIES

A few years ago we were boasting as a nation that the production of farm crops in this country had reached the enormous total of ten billions of dollars. It is possible it is several times that today. The idea in mentioning that enormous sum is only to make comparison with another set of figures secured through the operation of the war tax on luxuries.

Secretary Houston has permitted to be known a few figures regarding some of the luxuries annually consumed in this country. For instance:

Chewing gum	\$ 50,000,000
Candy	1,000,000,000
Soft drinks and ice cream	350,000,000
Cigarettes, \$800,000,000; cigars, \$510,000,000; tobacco and snuffs, \$800,000,000	2,110,000,000
Toilet soaps	400,000,000
Perfumery and cosmetics	750,000,000
Furs	300,000,000
Automobiles and parts....	2,000,000,000
Pianos, organs and phonographs	250,000,000

This is only a portion of the expenditures for luxury class articles. The total aggregates, according to Secretary Houston's figures, about \$23,000,000,000. Fifty million is a big lot of money to spend on chewing gum, but the gum chewing girl who has been the butt of many a joke shows her own inefficiency compared to the cigarette smoker. It takes 16 girls to chew up as much money as is smoked up by one cigarette boy.

Another surprising feature is that there is invested annually in pianos, organs and phonographs—which many may class with essentials, especially from an educational standpoint—the very lowest sum of any of these luxuries mentioned excepting chewing gum.

If we could forget these luxuries for one or two years, the entire war debt might be paid off with the economy made possible. We are not suggesting such economy. But, really, aren't we spending pretty liberally?

PROMOTING A COMPANY

There are few of Cultivator readers who have not had opportunity to invest in oil or copper or manufacturing or some other form of promotion scheme, legitimate or, possibly, an absolute fake. The Iowa Homestead has been making some investigations as to the methods of putting these new corporations into being.

According to the Homestead, salesmen placing these stocks with farmers usually sell each \$1,000 worth on the basis of \$250 cash and a note for \$750. The salesmen pocket the cash and turn over the note to the promoter. This note then is offered a bank for discount at, say, ten per cent, leaving \$675. However, the purchasing bank seldom desires to pay out actual cash, and the method employed is to give a certificate of deposit without interest, due at maturity of the note. The companies are thus assured of protection but are no nearer the cash, so the certificate of deposit is in turn discounted at another bank at perhaps 15 per cent, which means that out of the \$1,000 sale but \$573.75 finds its way into the treasury of the company.

Concerning oil promotions in the Middle West, a letter made public by the National City Bank from Topeka says:

"The rise of the 'unit' system made a particular appeal to the speculative investor. The one-eighth royalty retained by the land owners was the basis of high finance. Purchasing, one-tenth of one-eighth for \$10,000 in a field where some production had been found, this fraction was capitalized into thousands of units, each purporting to be an undivided interest in the fraction. In some instances a \$10,000 fraction was the basis for 100,000 units sold at \$20 each, and these were scattered over the state with a rapidity that made many fortunes. In one instance the units numbered 5,000,000 at ten cents each. Complaints to the blue sky board showed that some owners of units would not receive one per cent of their investment until the property, yet to be developed, yielded \$2,000,000 worth of oil. Widows' estates were frequently wholly invested in these securities."

ORDER NOW

Nurserymen are already checking up on next year's stock. The number of trees of various kinds will total millions. There is a bare possibility there will be enough to go around, but allow us to make a suggestion, and that is to the fellow who has not placed an order for his next season's plantings. He may well look upon the gas line which is being formed early these mornings and meditate upon the fact that he may not find relief when it comes to securing trees. The wise orchardist is also checking up on his needs as to number of trees and casting about where these particular varieties of trees are located.

SHIP IN SHIPS

The shipping board is endeavoring to secure relief from the present grain and food congestion by authorizing use of lake built ships to carry some of the crops of the Northwest by the way of the Great Lakes to tide-water. The grain is loaded at Duluth, Chicago, or other Western points with 100,000 bushels each, which is carried to Buffalo, where, in order to secure safe passage through Welland Canal, it is necessary to unload about 80,000 bushels, when the vessel goes through safely and on to the sea. This is remarkably fine for producers in the Great Lakes section. How about the Pacific slope? Government built ships have aided in the carrying of some of its great traffic, but we have such great possibilities that we wish there were some far visioned one on the Potomac's banks who could see this far.

Use of these ships on the Great Lakes has resulted in great reduction in the carrying rate. The shipping board has felt that an apology is necessary, however, and announces: "There is no profit in the operation of these boats and it is an emergency proposition only." Many well wishers of producers and consumers are hoping.

MIGHTY SHODDY

The National Sheep and Wool Bureau of America has recently issued the following statement:

"The prices of rags fit to be re-worked into cloth increased from 300 to 1200 per cent between June, 1914, and December, 1919, through the increased use of wool substitutes in cloth sold as 'all wool,' a term understood by the public to mean all virgin (new) wool."

"Textile manufacturers prefer wool substitutes because they can make more money with them, while the law permits cloth made of them to be sold unidentified through stamping, than they could make with virgin wool. In consequence rags have elbowed virgin wool out of its legitimate market and wool growers face ruin."

"The public demand for virgin wool is great, but the response of the textile manufacturers is little. Last year they gave the public an allowance of three pounds of virgin wool per capita. The need, it is thought, is 12 pounds per capita."

"The French-Copper Truth in Fabric bill, which was left with the committees on Interstate commerce in both houses of congress at adjournment, was designed to compel manufacturers to stamp cloth with its content of substitutes and of virgin wool."

"Through the identification of substitutes by stamping the public would learn what sort of cloth it is offered in the name of 'all wool' and would be allowed to decide for itself how much virgin wool it wants per capita. Untrammelled public demand would recall the accumulations of unmanufactured virgin wool from the storehouses and restore its market."

Readers of the Cultivator who are anxious to know what they pay for can aid in securing the passage of the proposed legislation by writing to their representatives in congress. One fact is certain—if the producers do not demand such legislation they will never get it.

Copyright 1920, by The Goodyear Tire & Rubber Co.

"Your Goodyear Cord Tires on our truck go right through the plowed ground of our citrus groves, permitting loading at the trees, and they protect the fruit, particularly the lemons, which are very delicate, by smoothing the haul to the packing house. They save labor, fruit, time."—H. J. Kelly, Packing House Manager, Charles C. Chapman Ranch, Fullerton, California

IN rural hauling like this and in farm duty radically different, the use of Goodyear Cord Tires on trucks has been found productive of a variety of important advantages.

Their traction has increased truck utility for farmers, ranchmen, fruit growers, dairymen and others, particularly owners of motorized farms, by enabling easy hauling through soft fields.

Their cushioning has effected continuous savings in the marketing of delicate vegetables, fruit, dairy products and of eggs and livestock, all of which suffer on slow, jarring solid tires.

Their nimbleness often has accomplished more hauling with less driving and resulted in a quicker feeding of power machinery while releasing hands and saving time for farm work.

Throughout extended terms of service these virtues have been delivered with the stout reliability developed in Goodyear Cord construction by manufacturing methods that protect our good name.

Farmers' various accounts of their successful use of Goodyear Cord Tires on trucks can be obtained by writing to The Goodyear Tire & Rubber Company, Akron, Ohio.

GOODYEAR
CORD TIRES

Can you measure $\frac{1}{1000}$ of an inch?

Think of a hair split into 10 strands! This conveys some idea of the degree of accuracy to which parts for the Best Tracklayer are dimensioned and fitted.

Accuracy in the dimensions of the various working parts is so vital to long life and satisfactory service of a tractor, that in the Best factory highly scientific precision instruments in the hands of master machinists are used constantly in gauging dimensions. Parts are painstakingly "machined" by special tools and jigs, all in charge of the same skilled mechanics.

Much also depends upon selection of the correct materials. Long tractor-building experience has enabled us to determine just what sort of metals gives best and longest service for each working part.

So then, "workmanship and materials" have a very definite bearing on the service your tractor gives. No greater care is used in building the highest grade automobiles than is used in making the working parts of the Best Tracklayer Sixty. The result is a tractor that has become famous for power, durability, dependability and low operating cost.

Beside workmanship and material, the features that have made the Best so successful are: Simple valve-in-the-head, slow speed motor, built in our own factory—three-point suspension and full oscillating tracks which take strain and jolts off frame and mechanism—36 anti-friction bearings—manganese steel tracks—non-friction greaseless rocker joint for track links which doubles life of tracks—complete housing of working parts—ease of handling—60 horsepower at the pulley, 35 at the drawbar.

If interested in tractors, write for our catalog.

Are Raisin Prices Too High?

By Cultivator Staff Writer

TWO years ago when the California Associated Raisin Company entered into an agreement with the food administration for a five and a half cent price for raisins they were severely criticized by the independent packers because they did not secure all the traffic would bear. Last season when a ten cent price was named by the association they were accused before the United States department of justice of profiteering. Today these critics and accusers are working hard for an 18 cent sweatbox price to the grower, so it seems that it is getting more and more difficult for the raisin company to please its members, the consumer and the independent packer all at the same time.

President Wylie M. Giffen of the association has just announced that a plan, which he admits is an experiment, will be tried out this year, which may serve to place raisins on the market at a price which will be satisfactory to all and particularly to the consumer; in fact, the consumer is to be allowed to fix the price at which he shall buy raisins from the association.

The president's assistant, F. A. Seymour, and Sales Manager Thomas are now in New York making final arrangements for a public auction at which from 200 to 500 cars of loose Muscats will be offered to the highest bidder. The effect of such an auction sale can be readily imagined. If the public in open market bids less than the price named last year, then the contention of the independent packers before the federal trade commission regarding arbitrary price fixing will be materially strengthened, while if, on the other hand, the public is willing to pay more than last season's price it would seem that the raisin company is justified in its position.

The goods to be offered at the auction, which will be held in New York in a very short time, will all be loose Muscats, and the seeded and seedless goods will be sold as heretofore, at a price to be named not later than August 8. Goods will be sold for October shipment on the regular dried fruit contract. Bidding will be open to buyers from all parts of the world. Goods will be sold f. o. b. Fresno, but will be shipped to any point designated by the buyer.

In his letter to the growers explaining the methods to be employed in fixing prices this year, Mr. Giffen stated:

"It is our purpose as a board of directors to sell this crop as nearly as possible at its market value as indicated by the law of supply and demand, but we must remind you that the market value of the whole crop is often a different value from the value of a single crop, and the one thing that seems to us absolutely vital to our existence is that the price named should not retard the flow of raisins into the hands of the final arbiters of our success, the consumers. Admitting freely that the present market on raisins is exceedingly strong, we must not overlook the fact that a crop cannot be sold, delivered and eaten in a day, a week or a month, but is the problem of a year, and in these days of inflation, discontent and uncertainty, who is there among us who can determine now, a year in advance, the difficulties that may come to prevent the marketing of 200,000 tons of raisins before another crop is grown? Who can tell how many thousand tons of Smyrna and Spanish raisins and how many thousand tons of Grecian currants may be dumped into the United States this year in competition with our California crop as a result of the high prices now prevailing; and who among you as growers, in view of the fact that practically every student of financial conditions will tell you that there is at least impending danger ahead, will say without hesitation that there will not be financial difficulties in the next 12 months that may seriously affect the consuming power of the country?"

"Your board of directors are only ordinary men who do not pretend to know the answer to either one of these questions, but we are not 'asleep at the switch,' and though realizing the difficulties of the task committed to us, we are imbued with an ambition and purpose amounting almost to a

passion to solve this problem with credit and honor to ourselves and profit to you.

"This plan may appear to you on first thought to be revolutionary and impracticable, but we have given it a great deal of thought and believe it has many advantages. There are three parties vitally interested in this question—the buyer, our competitors, and the growers. Under this plan the buyer should be pleased because he makes his own price, and certainly will not make it any higher than he believes the goods will be worth. Our competitors will be pleased because their contention that they be allowed to buy goods on the same terms as other people is recognized. They are now absolutely unfettered so far as we are concerned and can buy raisins from us on exactly the same terms as other buyers. On the other hand, if they do not care to buy there will be no displeasure on our part, as we feel sure there will be plenty of buyers; but what is more important to us is that we believe the growers will be pleased because, in our judgment, raisins sold this year at auction will bring a higher price than if we were to pursue the methods heretofore employed in naming an arbitrary price."

Undoubtedly the raisin company officials will name the average price received from the sales at auction as the price at which it will sell the remainder of its crop, although it is possible that other auctions will be held later in the season. This new plan will be watched by all growers cooperative organizations throughout the nation, and if successful will be another milestone on the great highway of successful cooperative marketing.

JAPANESE PLUMS

As the Japanese plum was introduced to the Western world by way of California, the first named variety being the Kelsey, the history of its coming to California is interesting to Cultivator readers. In the June number of the Garden Magazine, E. H. Wilson, the noted plant collector, informs us as follows:

"The plum cultivated in the temperate parts of eastern Asia is *Prunus salicina*, better known as *P. triflora*, or in the vernacular, the Japanese plum. It is indigenous in central China, where I have found it to be fairly common, but is unknown in a wild state from any other region. Curiously enough it is the only true plum known from all that vast region. In China it has been cultivated from time immemorial and there are varieties in quantity, some with greenish, others with yellow, red or bloomy black fruits. From China it has been taken to South Manchuria, Korea and Japan, where today it is extensively cultivated.

"It was introduced to this country from Japan about 1870 by a Mr. Hough of Vacaville, California, through the United States consul to Japan at that time, Mr. Bridges. The first ripe fruit of these East Asiatic plums was produced in the grounds of John Kelsey, Berkeley, California, in 1876. So impressed with their value was Mr. Kelsey that he urged others to take them up, and this resulted in their propagation being undertaken on a large scale by W. P. Hammon & Company, Oakland, about 1883. Today about 100 varieties of this Japanese plum are grown in this country.

"The cherries of China are the product of *Prunus pseudocerasus*, a small tree, wild in the woods of the province of Hupeh, central China. It is not very hardy but is cultivated over a considerable area in China and also in the warmer parts of Korea and South Manchuria. Formerly it was much grown in Japan, but its place has been taken by European cherries. It has not proved hardy in Massachusetts, but has fruited in Chico, California."

STATE FRUIT GROWERS

Dates are not chosen, and we believe it is not formally announced, but it is understood that the next or fifty-third state fruit growers convention will be held at Fresno, probably in late October or early November.

California Fruit Growers Wanted it—John Deere Built it

The John Deere No. 8 Orchard Tractor Plow is the result of a close study of the requirements of California fruit growers. The suggestions of a number of experienced fruit growers helped design it. It is an easily-handled, low-down, power-lift plow for use with small tractors in either orchard plowing or general field work. Its special hitch and lever construction and wheel base design permit work up close to the trees in throwing either to or from the row.

JOHN DEERE NO. 8 ORCHARD TRACTOR PLOW

has a reversible hitch and can be set out to either side so that the plow can run close to the trees when throwing either to or from the row. Note this feature in the illustration to the right.

Levers Have Side Adjustment—a feature you will greatly appreciate. See it illustrated at the right. When the plow is set to the right to get close to the row, the levers can be angled to the left. When the plow is set to the left, the levers can be angled to the right. In either case, with the plow working up close to the row, the low-set, angled levers, are conveniently back of the tractor operator, out of the way of the tree limbs and free of the tractor wheels when turning short.

Reversing the hitch and angling the levers is a simple matter—only one bolt to loosen in each operation.

Doesn't Scar the Trees.—Note also in the illustration to the right the wheel base design that permits close work in throwing either to or from the row, without scarring the trees. The furrow wheel doesn't project beyond the inner moldboard's wing. The land wheel is set inside the third beam.

Simple, Positive Power Lift raises the bottoms high and level at a pull on the trip rope by the operator. The lifting mechanism consists of a single, durable clutch on the land axle. It moves only when the plow is being raised or lowered—practically no wear.

And these other features.—The hitch has a break-pin for protecting the plow when striking a stone or root, and a simple slide and pin-lock for quick landing adjustment. Land and furrow wheels have a great range of adjustment for either deep or shallow plowing. There is a great clearance in throat of beams and back of bottoms to prevent clogging in trashy conditions or deep plowing.

The construction is strong and durable throughout.

The John Deere No. 8 Orchard Tractor Plow is equipped with three 10-inch bottoms that scour and pulverize to best advantage.

If you have a small tractor, don't fail to see the John Deere No. 8 at your John Deere dealer's.

And don't forget that no matter what the size of your tractor, you can get a John Deere Tractor Plow in either moldboard or disc type that will give you especially good plowing service.

Write today for a free folder describing the John Deere No. 8.

JOHN DEERE

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

We Insure Pear Orchards Against Blight

in the MAIN-LIMB CROTCHES, in the TRUNK, and in the ROOTS—the most vital and vulnerable parts of the tree—provided you plant our blight-resistant Chinese seedlings, the genuine CULTIVATED type of

Pyrus U-Su-Ri-En-Sis

and (after properly branching them) bud or graft the branches to the commercial varieties of your choice.

Below the point of union, THERE WILL BE NO BLIGHT.

Such trees will never die from this (the worst) disease of the pear, nor will your orchard investment be wiped out by blight—at present the outstanding menace to security and profit in this most profitable branch of horticulture.

Should any tree or trees covered by this invoice die within TEN YEARS from the date hereof from pear blight (*Bacillus Amylovorus*), we will refund to the purchaser or his heirs the purchase price thereof as shown by this invoice.

LOMA RICA NURSERY.

That is the agreement we incorporate in every invoice covering sales of Usuriensis seedlings (the genuine, CULTIVATED type) made on this basis. It shows our confidence in these stocks, but a more convincing proof of that confidence is shown by the fact that we have already planted more than 5000 in orchard rows

In Our Own Orchard

and that we will next spring plant 10,000 more in Loma Rica orchard, later budding to Bartlett and other commercial varieties. These sturdy seedlings may be planted DIRECTLY IN ORCHARD ROWS, and we advise that practice, or they may be planted two feet apart in nursery until ready to transfer to orchard, budding them before transferring.

DON'T MAKE THE MISTAKE SOME HAVE MADE: don't assume that working a Bartlett top on a seedling which has blight-proof roots, trunk, and main-limb crotches will—by some magic—make the Bartlett part blight-proof also, because THAT "CAN'T BE DID"!

Susceptible varieties will ALWAYS be subject to blight—and we want every prospective customer of ours to get this fact ABSOLUTELY RIGHT—but our method confines the disease to the UPPER part of the tree—ABOVE THE UNION—where inspection is not difficult nor eradication expensive.

Scientific Experiment Proves

that so long as we grow the Bartlett pear, the best that we can hope for is to provide our trees with crotches, trunk, and roots of a species that is BLIGHT-PROOF.

With such trees, fighting blight three or four feet under ground—always at heavy cost and frequently with loss of the tree—will be ABSOLUTELY ELIMINATED. If blight takes a part of the Bartlett top, grafting will replace it; and a few years' growth will restore the tree to full bearing.

OUR METHOD—budding or grafting the commercial varieties upon the branches of blight-resistant seedlings—OFFERS THE GREATEST PROTECTION from pear blight that Science has been able to devise AFTER ONE HUNDRED AND FORTY YEARS' STUDY of the disease.

SCIENTIFIC EXPERIMENTS have convinced us that Usuriensis seedlings (cultivated type) are the best available for such use. They UNITE WELL with our commercial varieties; are VIGOROUS AND THRIFTY in growth; and are adapted to a WIDE RANGE of soil conditions.

Space will not permit telling the WHOLE story here, but this fall we will publish a bulletin giving further details. Any person interested who will send his address NOW will receive a free copy as soon as printed. In the meantime,

Order Your Seedlings Now

We can only spare about 50,000—a mere drop in the bucket of demand—and when these are sold we shall have no more for AT LEAST TWO YEARS, due to the failure of the Oriental collectors to secure seed last fall through crop shortage.

Our trees are thrifty, sturdy, well-rooted; none less than 3/8 of an inch in diameter, and from two to five feet in height. The price is \$40.00 per 100; less than 100, 50c per tree. Free packing on all August orders.

CAUTION: Dr. B. T. Galloway, of the U. S. Bureau of Plant Industry, warns against the use of Usuriensis seedlings of the WILD type in an article in Journal of Heredity, while highly recommending seedlings of the vigorous CULTIVATED type. Ours are EXCLUSIVELY of the cultivated type, and we offer them in the belief that nothing ever before available to horticulture will prove so valuable as a factor in blight control.

Loma Rica Nursery

Pear Specialists

A. L. Wisker, Manager

Grass Valley, California

NOTE: We shall have a small supply of Bartletts (a few thousand only) branch-budded this fall in nursery to Usuriensis, for delivery fall of 1921 at \$1.50 per tree, straight. Orders for this stock will be accepted now for delivery in the order received, so far as our stock will go. We can supply skillful workmen to bud seedlings furnished by us, where customers are unable to secure such help or do their own budding.

SACRAMENTO LEMON HOUSE

(Continued from Cover.)

From his records: In work room humidity was on June 3: low 22, high 84. In storeroom No. 9: low 69, high 85. Temperature at same time in work room: low 47, high 105. Inside storeroom No. 9: low 54, high 73.

FACTORS INFLUENCING FUMIGATION RESULTS

(Continued from Page 147.)

ages and folly to use a very light one. At the present time we do not know exactly how high a dosage should be used, but apparently fully a 100 per cent schedule is required. The subject needs careful investigation and this we are intending to take up the present season.

There is another type of resistant scale that must be considered, at least in some communities and orchards. And this is a scale that is made dormant during the winter season by cold weather. It has been observed that the black scale in many orchards fumigated about Alhambra, and also the purple scale in the low country toward the coast is sometimes more difficult to destroy in the winter than in the early season. Dosages which have given effective control early in the season have failed to control the insects at the average temperatures of fumigation, and particularly the lower temperatures, where a very cold spell of weather had preceded the actual fumigation. This dormancy appears to affect particularly the black scale and purple scale. In many localities this influence is little felt and late fumigation is very effective, and particularly is this true of the foothill section. However, in other districts, for the most part the cooler ones, the insects are sometimes decidedly more resistant to the cyanide gas during the winter and consequently in such cases greater dosages are needed than in warm weather to produce effective results.

Dosage

Dosage is at all times important. The tendency to use weak dosages, primarily to avoid tree injury even though many scale may escape, should be discouraged. In some districts, at least, too low dosage is the main cause of poor results. In this district I am favorable to the use of an 88 per cent at least or a 100 per cent schedule as soon as the trees will stand it.

Large trees have not been receiving adequate dosage. Although these dosages on the present schedule are equal to those used with the pot and cyanofumer for large trees when good results were secured, it appears that the proportionate dosage for large trees with liquid gas must be raised above that limit formerly followed. The gas distribution in such large trees is not as good with the liquid hydrocyanic acid. A new dosage schedule is being prepared in which the big trees will be scaled to receive the heavy dosage necessary. It will be distributed in time for the present season's work.

Liquid vs. Pot

At the present time many are saying that liquid hydrocyanic acid is a failure; back to the pots. Now, liquid hydrocyanic acid is not a failure. Some districts have had as good work done this past year with liquid gas as ever before in their history. The problem which confronts the Covina district cannot be explained as one of poor results due primarily to the liquid process, but appears to be due to other factors, at least some of which I have touched upon. In our own experience during the past three years we have in every case observed at warm temperatures exactly as good results with the liquid as with the pots. Series of trees side by side have been fumigated at normal temperatures under both systems and in such cases if either way was to be favored it was the liquid method.

SCHOOL OF POWER OPERATION

Prof. L. J. Fletcher of the college of agriculture, who is also chairman of the California Tractor and Implement Association's committee on demonstration, will conduct a "School of Operation" at the California state fair in September. The demonstrations in practical farm mechanics to be given by Prof. Fletcher and his five assistants will be held in the tent with the

"Power on the Farm" exhibit of the California Tractor and Implement Association. From September 4 to 12 interested power farmers visiting the Sacramento attraction will have the opportunity to learn the care and operation of labor saving implements, of which there is a display covering eight acres.

CONTROL OF LEAF HOPPER

A cheaper and better method of controlling the leaf hopper is indicated by a demonstration of the effectiveness of nicotine dust against this grape vine pest, held recently under the auspices of the Fresno County farm bureau at the Leffel vineyard north of Sanger recently. Ralph E. Smith, formerly of the university experiment station staff, conducted the demonstration.

It is thought that sublimed sulphur can be used as a carrier for the nicotine, thus making a preparation which will be effective against both the hopper and mildew.

CANTALOUPE STANDARDIZATION MEETING IN TURLOCK

A very interesting meeting was held in Turlock on July 23 under the direction of County Horticultural Commissioner A. L. Rutherford. The matter of standardization and inspection of cantaloupes was discussed. After the meeting a practical demonstration of the proper method of inspecting cantaloupes was presented on the "street" and at some of the principal packing sheds by Mr. Starr. Mr. Rutherford's chief inspector.

Thousands of Happy Housewives in Western Canada

are helping their husbands to prosper—are glad they encouraged them to go where they could make a home of their own—save paying rent and reduce cost of living—where they could reach prosperity and independence by buying on easy terms

Fertile Land at \$15 to \$30 an Acre

—land similar to that which through many years has yielded from 20 to 45 bushels of wheat to the acre. Hundreds of farmers in Western Canada have raised crops in a single season worth more than the whole cost of their land. With such crops come prosperity, independence, good homes, and all the comforts and conveniences which make for happy living.

Farm Gardens—Poultry—Dairying

are sources of income second only to grain growing and stock raising. Good climate, good neighbors, churches, schools, rural telephone, etc., give you the opportunities of a new land with the conveniences of old settled districts.

BEAN Threshers

Largest cleaning capacity of any thresher made and requires less help and power to operate. Pays for itself in one season. Hardwood construction throughout. Won't split the seed. Double cylinder. Made in six sizes—largest to smallest. WRITE FOR CATALOG.

California Implement Co.

122-124 N. Los Angeles St. Los Angeles

WANTED—A competent foreman for 800 acres citrus orchard, lemons, oranges; also capable packing house manager for orange packing house. Apply with references to James Mills Orchards Corporation, Hamilton City, California.

MACHINERY

OF EVERY DESCRIPTION
Bought, Sold and Rented

BUTTRICK & McCLELLAN

205-7 N. Los Angeles St., Los Angeles

MOLINE

The Universal Tractor

The correct way. One man handles the entire outfit and sees his work.

You wouldn't think of riding your horses. Of course this method is wrong whether horses or tractors are used to pull your implements.

The Moline Tractor follows the proven principle. One man operates the entire outfit from the seat of the implement, where he is in the best position to observe his work.

In a 10-hour day one man and a Moline Tractor can plow from 7 to 9 acres; disc from 25 to 35 acres; seed from 25 to 35 acres; mow from 25 to 40 acres; cultivate from 12 to 20 acres; and harvest from 25 to 40 acres. In addition the machine will do a great variety of other work and all ordinary belt jobs.

Compare these results with those of ordinary methods. In many cases the Moline enables one man to do at least twice as much work. These facts are borne out by the results obtained by Moline owners.

Moline owners in 37 states say that the Moline Tractor saves an average of one man per farm, as well as five horses, because it does all field work, including cultivating.

The Moline Tractor increases production by enabling one man to do more work, and decreases the cost of production by saving help and horses.

Profits of from \$500 to \$2200 a year, from the Moline Tractor alone, are being reported by Moline owners from all sections of the country.

MOLINE PLOW COMPANY, MOLINE, ILLINOIS

Sandstrom Tractor Scraper

An Ideal Scraper to Do Your Leveling

It is light draft and operated by driver from the tractor seat

Made in 3 Sizes for Small or Medium-Sized Tractors

Manufactured and Distributed by

Dealers wanted everywhere

Almond Huller, \$415.00

Manufactured and Patented by

L. K. VAUGHAN, 172 Elm St., Woodland, Cal.

Some Smiles For The Farmer

Have you seen the Almond Huller that don't wear out the fingers and you don't have to stand at the stacker and see the meats going into the hulls as loss? With this machine you can hull or crack all the nuts and no waste at all and have time to go to all the fairs and no worry. Write for any information. 1 1-3 tons in 10 hours guaranteed.

This Folder Tells You How To Make Your Idle Land Earn Money

This is the day and age when you should make every foot of land produce profits for you. If you have any size tract ranging from 80 to 5,000 acres in the Western States that need development you should send for this book at once. It tells you the way to develop your property through the use of Hydro-Electric plants, gravity irrigation systems, pumping plants, grading, and buildings; in fact, it points out the various essentials that are necessary to make your ranch a producing property. Now is the time to act, so that you can get a crop from your land next year. It is a certainty that crops will bring good prices next year, so take advantage of this condition and get your land under cultivation now. Write today, stating location of land and number of acres.

August in the Vegetable Garden

Southern California

By D. F. Reichard

HE fall planting time is here. August is the month in which much of the winter vegetables should be planted. There is also time to plant some of the early maturing summer vegetables, too.

Soak your ground thoroughly, make basins and fill them with water. This is one of the best ways of getting the ground wet. When fit, work the soil to a depth of ten or 12 inches, getting it in nice fine condition for planting. It is a good plan, and it will pay too, to soak and work up the ground twice before planting during the summer months.

The main planting of fall potatoes is put in during the first ten days of August, although plantings may be made any time during the month. It is always advisable to treat the seed, dipping them in either a solution of formaldehyde or corrosive sublimate for the prevention of scab and rhizoctonia, diseases that greatly reduce production. Dwarf or bush beans may be planted. During the early part of the month put in Stringless Green Pod or Refugee beans, while the latter part of the month Canadian Wonder and Ventura Wonder should be used. Pole beans planted this late are almost sure to mildew and rust.

Sweet corn planted during August will make roasting ears in ten or 12 weeks. Use Golden Bantam and Coun-

try Gentleman for sweet corn and Early Adams for something quick and hardy. Cucumbers and summer squash will still make and will be greatly appreciated during the hot weather of the fall. It is too late now to plant winter squashes and melons, as the frost would get them before ripening.

For planting the hardier vegetables—most of them have small seed—the ground should be in especially fine condition and well supplied with moisture. The seeds of these should be planted deeper at this time than in the spring, because the ground dries out so fast that unless they are covered a couple of inches the seed are in dry soil before they germinate, or, what is worse, they germinate and then dry out and die and the seedsman is accused of selling poor seeds.

Make plantings for winter use of Egyptian beet, Half Long carrot, Swiss chard, Curled endive, New York lettuce, kohlrabi, Bermuda onions, either sets or seed, parsley, parsnips, radishes, spinach, White Globe turnips and Stratagem or Admiral peas. Sow in beds cabbage, cauliflower and kale seed for transplanting. Tomato and pepper plants may be set out in frostless sections for winter use.

Dust the corn that is coming into silk with dry arsenate of lead powder; dust beans with sulphur to check mildew and to kill red spider.

Northern California

By A. R. Gould

ANY of the main crops will be ready to harvest this month, and it is a wise plan to clear the ground for future action, which means preparing plots for winter crops. The crops ready this month for storing will be onions, turnips, beets, carrots and potatoes, and all these may be stored in a dry cellar for winter use. Some soil preparation is needed and immediately the plots are cleared lime should be dug into the soil. We have often advised the liberal use of farmyard manure where it can be obtained but it is not always available and it is then often necessary to secure commercial fertilizers.

Beans

Runner, or climbing, types may be staked and seeds of dwarf varieties might still be sown for a late crop the last of the season. Sow Stringless Green Pod, Red Valentine or Canadian Wonder at once. Sow these in rows two feet apart.

Cabbage and Cauliflower

These useful fall crops will need a good irrigating this month and thorough cultivation between the rows.

Brussels Sprouts

Plants may be put out this month 18 inches apart in the rows. They require a rich soil and will repay attention.

Lettuce

To keep up the supply it will be necessary to sow Los Angeles or May King, a variety which quickly matures. The first named, however, is also very excellent. Have these plots well manured and sow the seed thinly in rows and eventually thin out the seedlings to six or eight inches apart.

Tomatoes

The early varieties should be ripe this month, and attention must also be given to tying up those grown on the three stem system. Keep all the axil shoots removed. If aphid is giving

trouble and the black fly is usually busy this month, spray with liquid nicotine.

Parsley

For the winter supply sow in rows Moss Curled and thin or transplant six inches apart.

Turnips

For winter use sow during the latter end of the month Purple Top, White Globe or Yellow Globe. This crop thrives in a rich soil and should not be allowed to dry out during active growth. Sow very thinly and thin out to nine inches apart in the rows.

Leeks and Celery

An application of liquid manure will be very helpful to both crops, as they will be making strong growth this month. Cow manure is best to use. Apply once or twice weekly and prepare it by placing a sackful in a barrel of water.

Potatoes

This crop should be dug as it ripens. The tops will indicate when ready, as they turn yellow. Every care should be exercised, as the tubers will not keep if bruised.

Kale

Plants of these should be ready from the seed bed for transplanting by the middle of the month if sown as advised for July. However, seed may yet be sown of the Tall Green variety. It is valuable also for poultry. When planting out place two feet apart in well manured soil.

Radish

Sow Crimson Giant and Half Long on a well prepared border. Seed may be sown in rows or broadcast.

Carrots

Sow Danvers Half Long and French Forcing, both very popular varieties. The last named matures very quickly. Sow in rows 18 inches apart.

Parsnips

Keep well irrigated and the soil well worked between the rows.

Onions

Some of the main crop varieties will be ready to harvest. As the tops turn yellow they may be pulled up and hung up for winter.

AUGUST IN THE ARIZONA GARDEN

By M. E. Bemis

UGUST might be appropriately called the "get ready month," for active preparation for fall garden work should be well along before the last of August, if indeed it has not been under way all summer. Manure should be spread on the land and plowed under, weeds kept down and all possible preparation made for the planting of seeds in September.

This does not mean that there are not many things which may be planted in August, only that there are many more which may be put in in the month following.

August is the time for planting the fall crop of beans. String beans will do perhaps better in the fall than in the spring; at any rate it is well worth while to plant beans for the fall garden. Of pole beans the Kentucky Wonder, Kentucky Wonder Wax, Broad Windsor and White Seeded Kentucky Wonder are recommended. The bush varieties best adapted are Stringless Green Pod, Black Wax and Improved Golden Wax. Lima beans are the well known Burpee's Bush and the Large Lima. Beans frequently are ready for picking in six to eight weeks when planted in good soil with moisture conditions right.

Cabbage seed should be planted in beds or cold frames the latter part of August. If planted in a bed it should be shaded, as one of the chief difficulties in planting the small seeds at this season of the year is to secure germination. In order to do this it is absolutely necessary that the ground be kept as cool as possible. In cabbages the Early Winningstadt is one of the best. The Copenhagen Market has proved excellent also, and a special brand of this variety known as the "Cactus" has seemed to have some superiority over the parent variety for this section. This is said to be one of the earliest of the round headed varieties.

Cauliflower is grown to some extent and might probably be grown in a larger commercial way. It is rather easily grown if the soil is rich and porous. Henderson's Early Snowball and Large Pear are good varieties for Arizona. The cultural methods usually employed for cabbage will answer for cauliflower.

Beets may be planted any time in August, although the first part of the month may be a little too warm. If some method of shading is devised these small seeded plants may be made to germinate and thus earlier vegetables raised than would otherwise be possible. Eclipse and Crosby's Egyptian are splendid. Extra Early Egyptian, Early Blood Turnip and several other varieties do well.

August is a little early for carrots, unless the nights are cool along towards the latter part of the month.

Brussels sprouts and collards have their favorites and may be planted in the latter part of the month. There is still time to plant the Papago or Pima Indian corn for roasting ears and even the Mexican June corn should make roasting ears when planted the early part of the month.

Probably the most important winter truck crop in the Salt River Valley is lettuce, and while it is of little use to plant this before September, the best chances of success are had when the preparations are made early in September. Preparation in this case means plowing under at least three tons of manure to the acre, and this should be well rotted. Fertilizing in this way insures the early maturity of the crop, and this is one of the little secrets which spells the difference between success and failure. Lettuce growers have made splendid profits here, and each year there are some that clean up nicely and others that lose money. "Getting ready" is a great and important factor in success in growing lettuce or other vegetables as well.

Potatoes are not an unqualified success as a crop in southern Arizona, although some good yields have been obtained. The fall crop does not as a rule yield sufficiently well to justify planting on a commercial scale, but for the home garden a few add to the variety of things which may be planted and help out on the table menu.

Beware of the chap who doesn't know anything and doesn't know it.

August in the Ornamental Garden

Northern California

By A. R. Gould

HIS is a very trying month for many garden subjects, as the continued dry, hot spells make it necessary to keep the sprinklers going, and, unfortunately, in many districts there is a water shortage. However, it is surprising how many shrubs stand it and how many perennial plants are able to survive. Many of our native shrubs are able to stand drouth very well, and among these are Ceanothus, Rhus, Rhamnus, Prunus ilicifolia, wild cherry, and Ribes, of which there are several species, also the California holly, Heteromeles. To those who have a dry situation and are in search of something to solve the problem, the above named will help out. There will be some cleaning out to do in the perennial borders. This month some of the earlier subjects, having finished flowering, will need to be cut down. Some subjects,

like the tall growing Campanula pyramidalis, Boltonia, Bocconia, etc., will also need stakes for support and certain shrubs such as spirea, fabiana, veronicas, may be cut back. After flowering simply remove the dried up flowering branch. Roses may also be pruned back this month and a fine fall show of flowers will be the result. After pruning they will not need quite so much water for a few weeks, and a good mulching with farmyard manure will be helpful at the roots.

Aquatic Plants

These are now at their best. Water lilies in all colors are now flowering and making rapid growth. A pool of these adds considerably to any garden of large size and, given the necessary start, they are not hard to grow. Water iris are very pretty as an addition.

A Beautiful Native Tree

Lyonothamnus floribundus, Catalina ironwood, is somewhat rarely seen, but should certainly be more widely planted. It grows 15 to 20 feet high and has fern like foliage and white blossoms in trusses. Make a note of this for next season's planting list.

Some Subjects to Sow Now

Pansies, primroses, violets, dianthus, schizanthus, myosotis and snapdragon should be sown on a well prepared border, semi shaded or in boxes. Sow thinly, as, if the seedlings come up thickly, they have a tendency to become drawn and many "damp off." Sweet alyssum, candytuft and mignonette may still be sown where it is to flower. These will all provide bloom for the winter season.

Pentstemon Spectabilis—This is a most useful flower, being a native growing four to six feet high and is in flower several months, having blue flowers.

Sweet Peas for Winter Flowering—Seed of those varieties, such as Early Warbler, Early Liberty, Early Morning Star, etc., as advised last month, may still be sown in trenches of ma-

A Better Car at a Saving

Compare the New Mitchell with cars costing \$500 to \$1,000 more

Just compare price before you buy. Get the latest quotations. See if you can find a car to equal the New Mitchell at its price.

We believe it impossible. We know every car. And our policy has been to offer more than usual. We want to uphold the Mitchell reputation of giving the utmost for the money.

While the New Mitchell is being bought largely because of its style and performance, its comfort and lasting newness, there are thousands who buy it to make

the saving. It is noted the country over as under-priced.

The New Mitchell is the finest car we ever built. It brings mechanical perfections hitherto unknown in a like-price car.

It brings improvements and refinements found only on higher priced cars.

Prove all this yourself. Make comparisons.

Examine this new car carefully, then see if you agree that it is the best car for you.

The Old Reliable Albany Nurseries

General nursery stock, including all the leading commercial varieties of fruit trees for the coming season's planting. Also Ornamentals, Small Fruits, and Flowering Shrubs. Highest quality at the lowest consistent prices. Orders for future delivery should be placed while stock is available. Address

ALBANY NURSERIES, Inc.

ALBANY

OREGON

nure deeply dug and prepared. They will need plenty of watering.

Cinerarias and Mimulus—Both these are useful for a shady situation and seed may be sown now. Of the former the star shaped are pretty as also are the larger flowered grandiflora types. Of mimulus the large hybrids are the best to grow.

Chrysanthemums

Keep those intended for specimen bush plants pinched back to encourage a bushy habit. Feed with liquid manure every week.

Violets

These very fragrant flowers may be divided up, the clumps and new beds planted in a semi-shaded position. They repay for liberal treatment with manure and a good watering.

Dahlias

These will require liberal feeding with liquid manure at least once every week, and disbudding should be car-

ried out to secure large flowers, removing the two side buds and leaving the terminal.

Climbers

All such as bignonia, cobeia scandens, jasmine, etc., should be tied in to the trellis. Spray climbing roses for mildew with liquid sulphur. Nasturtiums in various colors, climbing types, may still be sown and will make a good cover for a bank or slope temporarily, or if a permanent cover is required, vinca, ivy or honeysuckle may be planted. Ficus repens will cling closely to a wall and is effective as a cover, while for a delicate tracery use Ficus minima for creeping on rocks, etc.

Lawns

Constant attention will be required to keep them well watered and weeded. Re-sow any bare spots. If contemplating making a new one, have the ground well prepared this month and next and encourage all weed growth before sowing the seed.

Southern California

By Ernest Braunton

SO much profit comes from observing the practices and accomplishments of others that one may be pardoned for calling in the flower show as an introduction to an early autumn garden calendar. The Dahlia Club of Los Angeles holds its first public exhibition, September 23-24, at the Alexandria Hotel, the Pasadena Flower Show comes late in October, and in November a floral, plant and fruit exhibit will be staged at Redlands. Other cities will have shows of like kind and much may be learned of sound garden practice by attendance and chats with exhibitors.

August, like the preceding month, is not one of sowing, but rather of harvesting. It is, however, a month of much guard duty. The orchardist, nurseryman and gardener are alert in their relentless war against insect pests. There are many of these in the garden, and it is not our purpose to list them, much less to prescribe remedies. Many plants will be troubled with aphids and red spider, however, and health of plants has much to do with their control. Such insects do not long or seriously infest vigorous plants that are well and forcibly "hosed off" daily. Force of water is alone relied upon by the better gardeners to rid plants of these pests. Chrysanthemums will be most attacked by aphids and violets are the favorite hosts of red spider.

Sowing Seeds

Professional plantmen are sowing seeds of eucalypts and acacias from Australia, plant seeds of all kinds from there, South Africa, or seeds of California native trees and shrubs. So take your cue from these trained and experienced propagators and sow seeds from climates similar to our own. If Monterey cypress is needed

for hedge or windbreak, now is the time to sow in beds or boxes. Hardy perennials for the garden are best started now, for the young plants will then bloom next year and as early as though the seeds were sown in the spring. While the annual cineraria is a cool weather plant, to have at best time for bloom development the seed should be sown in August. Sow in a rich loose soil in a shady spot, in boxes rather than in beds, unless the latter are neat and confined by border enclosures. Plants should be potted, shifted again to larger pots and given an occasional feed of liquid manure until time to plant in permanent position. Such time is when plants are large and vigorous, yet before any buds appear.

Roses for fall bloom should not be watered during August or early September, but have a summer rest for recuperating vigor to meet the demands of a November flower crop. This is a trying month on all plants that should be kept growing and one should watch closely that no wilting takes place through lack of soil moisture. Dust is everywhere and seriously clogs leaf pores of all plants. In cool of evening hose foliage vigorously but do not presume to substitute such watering for proper irrigation. No crop suffers more from lack of water than chrysanthemums, and they can hardly have too much or too frequent applications. Dahlias that bloomed early may have their tops cut off, be well watered and fertilized and be made to produce a fine flower crop during November. Do not forget planting altogether, for there are both seeds and plants that should go in the soil this month, and the list of possibilities is long. Ask your local plant dealer or seedsman what is best to plant; their business success hangs upon having such material for sale.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Squash Bugs

Is there a spray or anything which will exterminate squash bugs? Have a fine pumpkin and squash patch, but the bugs are killing every one.—Subscriber, Bishop.

The squash bug seems to be so resistant to the ordinary dosage of poison that if squash or cucumber plants are sprayed with a solution sufficiently strong to poison the pest it is liable to prove injurious to the plant. The best remedy of all is to get out early in the morning early in the spring and do a thorough job of hand picking. If taken before the egg laying is commenced the garden may be fairly free from them during the summer. The bugs may be trapped by placing boards under which they may find shelter. Then by lifting the boards they are easily destroyed. If the ground around the plants is ridded

of them, then the plants may be covered to protect from further infestation. A little relief may be had by using repellents such as gypsum or ashes saturated with turpentine or coal oil, and this scattered around on the ground.

Cheap Paint and Stain

In your Questions and Answers of July 17 I read an article on cheap paint. For the last three years I have been using the following mixture on shingle roofs and all rough lumber: 1 gallon crude oil at about 10 cents per gallon, one gallon No. 2 stove distillate at 10 cents per gallon. To every gallon of this mixture add 4 pounds of Venetian red or the same amount of Prince's metallic. The latter will make a very dark brown stain, the other one quite red. I generally use two pounds of each. They cost about five cents per pound. I use a spray pump instead of a brush. Mix this stain a day or so beforehand and stir several times. By using a spray pump a much better and quicker job can be done, but it takes two or three

times as much stain. But with stain at 30 cents a gallon it pays to use plenty. Keep this well stirred while using and the color will last several years. I use a small hand pump in a bucket, but had to buy a finer nozzle. A cheap stain for inside finish on Oregon pine is the black-dope that comes with rubber roofing, thinned with coal oil. Apply with brush and wipe with a cloth in a few minutes. One of the nicest houses in Glendale is finished inside with this, but the owner doesn't know it. We called it fumed oak.—E. K. Grant, Wasco.

Another cheap stain for inside finish is to simply take a bottle of ink, or, better still, a bottle of the blue black writing fluid, mix with water and brush over surfaced Oregon pine or similar finish of beautiful grain and one may get a pale gray stain. Test on sample board so as to secure right consistency. A very light shade may be secured by brushing on the board and then wiping off. If a silver gray is desired add whiting or calcimine.

Wells in the Yucca Belt

Can you or any of your readers give me any idea how deep I will have to drill a well to get water on land where the giant yucca grows? Our wells here at Agulla, Arizona, and vicinity are about 350 feet on an average. Just northeast of here about ten miles is the southeast end of the great yucca belt reaching from Mojave, California, into Arizona. I do not know of any well having been drilled in this belt and would like to hear from someone having had experience. Some of the best land in Arizona is in this yucca belt, but everybody is afraid to tackle it for water.—Subscriber, Agulla, Arizona.

Have any of our readers had experience which would help out this inquirer?

Grapes for Wine

Where can dried wine grapes for making wine for private use be bought and what is the price? Is it against the law to ship these grapes?—Subscriber, Exeter.

We believe it is unlawful to ship grapes for wine making purposes. However, best information in this particular may be had by writing California Grape Growers Protective Association, E. M. Sheehan, president, American National Bank Building, San Francisco.

Poisoning Squirrels

What is the best way of placing poison for squirrels? Have tried poisoned barley, which was not very effective. What is the best time of year to place poison?

The poison grain as prepared by horticultural commissioners or farm advisers has usually been especially successful in reducing the squirrel pest. At this time of the year, however, if the pest is infesting a grain field or a place where they get plenty of good grain and where they have a dearth of fruit, watermelons, apples, or almost any fruit are most attractive to them and may be poisoned with strychnine.

Cabbage Aphis

I will be most grateful for an antidote for cabbage bugs. They are pink in color, gather in bunches, the leaves curling up and finally dying.—Subscriber, Banning.

These insects must be aphids, though cabbage aphis has a white, powdery cover and pink "flesh" beneath. Prepare a spray of one ounce of 40 per cent nicotine sulphate, five ounces of common soap and five gallons of water. Boil the soap in a lesser quantity of water until dissolved, add water to make five gallons and stir the nicotine sulphate until thoroughly mixed and spray affected plants with this material.

Skin Disease of Rabbit

Doe has some skin trouble which leaves bare spots where fur all comes off.—Subscriber, Downey.

The statement of trouble is not complete enough to enable one to diagnose the case. If it is mange, which is often found, would wash scabs or skin with warm soap and water and apply an ointment of one part sulphur and three parts pure lard. Again, doe

may be inbred and system not able at times to properly supply skin with nourishment for roots of hair. If subscriber will describe conditions of subject more fully, will reply at more length, if possible.—W. D. W.

Ground Burnut

I am sending herewith a bad weed that spreads rapidly. Should like to know what it is.—Subscriber, Fairmead.

This is the ground burnut described on page 101 of the Cultivator of July 24. Every means possible should be taken to eradicate this rapidly spreading pest.

Cory Thornless

Will the Cory Thornless blackberry revert and become thorny?—Subscriber.

All life reverts, occasionally, to original form, whether animal or vegetable. Any thorny plant occasionally has thornless parts. Such are common in many species of cactus, in fact in all cactus and other plants. It is not strange, then, that plants propagated from these parts occasionally or even constantly revert. In fact, such characters are often hard to "fix" in these aberrant sports.

He heads the splendid young herd owned by Mr. Wm. M. Bray, Klamath Falls, Oregon, who will disperse his entire herd of

50 High Class Registered Holsteins

at Sacramento on the above date. The owner is an extensive lumber operator and the urgent call of business in another section of the country necessitates the immediate sale of this herd.

THE FEMALES

There are 47 females in this sale, ranging from a beautiful 31 pound 7 year old cow down to an exceedingly choice lot of heifer calves. **ONLY TWO FEMALES IN THE HERD ARE OVER 4 YEARS OLD.**

The offering contains a considerable number of granddaughters of Margie Newman, former world's record milk cow, also granddaughters of King of the Pontiacs, King Korndyke Sadie Vale, and other equally well bred animals.

The entire herd over six months of age has passed two Federal tuberculin tests without a reactor, and there has never been a case of abortion in the herd, nor is there a single unsound udder in the herd. The entire milking herd, nearly all first calf 2 year olds, is averaging over 40 lbs. of milk per day on pasture and a very light grain ration.

There is not a poor individual in the herd, and there are several of real show caliber, and they combine in a striking manner, size, good health, type, and production.

**EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER;
EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED
AND SOLD SUBJECT TO RETEST BY THE BUYER.**

Catalog free on request. Write for one.

Big Livestock Auction Sale

245 Head of Purebred and High Grade Livestock

Col. W. C. Lookingbill Sells at Public Auction

at his Union Stock and Sales Yards

Holt and Monte Vista Avenues

Pomona, Tuesday, August 17

As Follows:

3 Pure Bred Holsteins—Alta Rosabel Korndyke 403637, 1st prize junior 2-year-old at Southern California Fair, 1919; her heifer, calved Dec. 11, 1919, Lillian Korndyke Jurupa, and a junior 1919 bull, Palo Gold Leaf, a second prize calf, whose dam was a 2-year-old made 24.6 lbs. butter fat in 7 days. The cow is sired by Rag Apple Imperial Korndyke, while the heifer and bull are sired by Tlinderne Korndyke Netherland, the noted Palo Alto bull. All three are nearly white, and all show cattle in any show ring, East or West. They are truly great cattle, and will not bring their real value in this sale ring. A rare chance to buy such cattle. Come!

50 Head of the Very Choicest Dairy Cows—Having purchased the Rex Toner Dairy Herd, which is one of the very best in the state, Bar None, they will be included in this sale, two of which have filled a 10-gallon milk can each, per day, when fresh. We have others that give 6, 7 and 8 gallons per day and the butter fat test of 7 days was 5.3 this entire herd. Surely Great Dairy Cows. If you want Real Cows, the kind that will make money out of high priced feed, come and buy some of these cows. One high grade Holstein Bull (bred by Col. Rhoades, and a good one). 5 Yearling Heifers. 12 Young Calves.

185 Head of Pure Bred and High Grade Poland China Hogs, consisting of 10 head of Pure Breds, as follows: 4 Sows, 1 Jr., 1 Sr., and 2 two-year-olds; 2 Jan. Gilts and 2 May Pigs. Real Foundation Stock sired by Superba, 5 times champion, and Long Smooth Jumbo, a champion, and a son of Big Bob, the \$40,000 Boar, and bred to Tourist Master, the great Iowa Boar, now owned by Mr. Christiansen of Arlington. Two March Boar Pigs sired by Riverside Model, a grand champion. If you want a few great hogs you will find them in this offering at half their value. (We have bred pure bred livestock for 25 years and we think we know a good one when we see it. You will not be disappointed. Our reason for selling this choice foundation stock is that we have not the room to care for it as we think it should be, with our growing business at the Union Stock and Sales Yards. A golden opportunity for some buyer.)

175 Head of Very Choice, Fat Poland China Hogs, Hard Grain Fed, will be sold in lots to suit. F. O. B. Los Angeles, or other equal distance. 1 Span of young real Draft Horses, and harness. Good Free Lunch at noon. Bring your cup with you. Sale will start at 9:30 a. m., quake or no quake, in our comfortably seated sale pavilion. Terms made known on day of sale. If you want credit bring late bank reference with you. Col. W. C. Lookingbill, Auct.; D. S. Velzy, Clerk.

The Victory Herd of Holsteins

Holsteins of known value, headed by Sir Phebe De Kol Regia Pontiac, a son of King Regis Pontiac Count, acknowledged one of the breed's greatest sires, and our junior herd sire, King Pontiac Alcartra Prilly, whose dam made 36.61 lbs. butter out of 805 lbs. milk in 7 days, now on yearly test. A young bull from this herd is a profitable investment.

HILLCREST FARM, H. E. Spires, Mgr., Carruthers, Cal.

Duroc-Jersey Swine of Highest Quality

Why Stockyards?

CALIFORNIA livestock people repeatedly bring up the matter of stockyards. Los Angeles at one time reached the stage of making subscriptions to a great stockyards scheme, but it was a scheme without reliable foundation. Sacramento has also had hopes. For some reason even government support, which was promised and given to a limited extent for a time, has not been sufficient to secure the establishment of the yards.

At the recent Cattlemen's Convention held in Los Angeles the matter was presented in such a way that it simply called for endorsement of the livestock men present at that time to put through the yards for Los Angeles. A strong campaign was made against this endorsement, and so far as audible voting went, the vote was practically unanimous against such endorsement. At that time Fred H. Bixby, president of the association, led the fight against the yards. He said:

"The cattlemen of this state—and I have traveled all over it—95 per cent of them, are against it. The idea of the cattlemen owning the stockyards, when they don't want them, is nonsense. It is a sure thing that the centralization of this business is wrong. The farm bureau sales will be in the communities closest to where the cattle are. They may be only 20 miles apart or they may be up to 50 miles apart. You bring your cattle in from your ranch and you put them up at auction and if the members of the association will come through and bring their cattle to these sales I will promise to get the buyers there.

"Now with all of the stockyards that I have ever seen—I have been to four or five of them—I never have known of a single case where the producer got a square deal. Not a case! He can't get a square deal when he has nothing to say about his business. It can't be done. Here is the only remark of Mr. Morrison's that has 'stuck in my craw,' and that is—I will pass by all the other remarks—that Jastro and I don't need the stockyards. That has been the greatest handicap I have had in trying to run this association. I have had the handicap of being a big cattleman. We need a stabilization of the market—we certainly do—you are right about that; but you insinuated that because we were big men that we could get out and ship our cattle East and we could do a lot of things that the little man can't do. I will tell you if there is anybody in the world that is fighting the battles of the little cowpuncher (the fellow who punches the cow), it is 'yours truly.' And of all the men in the state or in the United States who is battling for the rights of the little cowman and the man who is unable to fight his own battles, it is Mr. Jastro.

"Now there is one more thing to prove the fact that the producer when he ships to the stockyards gets stung. In talking to Harry Jones I found out that he bought in a stockyard this year—he bought about 6,000 steers, I understand. Why did he buy them from the stockyards? He went to Ogden and bought 6,000 feeder steers from the stockyards because he could get them there cheaper than he could get them in the country. If he bought out in the country, the man in the country would have gotten more money for the steers than he got for them at the stockyards and he had to pay the freight and the yardage and the commission and everything else and in the final windup get less and less all the time—less than he could have sold for right at home.

"Now I want this association—I will tell you I am speaking not only personally but I am speaking for 95 per cent of the cattlemen in the state of California—I want you to back me up in my position, and my position is this: That if I never do anything in the world but this, I am going to see to it that nobody hangs a millstone around the neck of the producer like the Union Stockyards."

We cannot feel that the sentiments expressed by Mr. Bixby are held by the great majority of cattlemen and we hope Mr. Bixby today has different ideas regarding the advisability of the yards. In any case, he has since found it necessary to send some of his stock to the yards located at Portland. This

was touched upon in a copy of the California Cattleman by David J. Stollery, secretary of the association, as follows:

"To the Members of the California Cattlemen's Association: By reason of the prevailing market condition, it would appear that outside markets afford the best opportunity for disposal of cattle in the present situation. You will find enclosed a detailed report presented by President Bixby covering a shipment of cows and steers to the Portland market on May 25 and sold there on May 31. Should you contemplate shipment out of the state and will advise us a few days ahead, we shall be pleased to assist in securing cars and in facilitating shipments."

This letter from Mr. Stollery was followed by a statement regarding the transaction which was made by President Bixby. It is as follows:

"In submitting the following report (in detail) of sale of nine cars cattle May 31, I call to your attention the following points:

"First—The four cars cows which brought 10.25 at Portland stockyards right straight through were dehorned. They netted me 9.40 at San Miguel. I could not sell these cows to anyone in the state even at eight cents.

"Second—The No. 1 Class A steers brought 11.50 at Portland and one exceptionally good steer 12.50. The rest of the steers which were not so good and among which were six or eight Holsteins, brought 9.65, 10.90 and 11.00. They were all dehorned.

"Third—These cattle were shipped approximately 1,000 miles. They were given an exceptionally good run—were sold on the Monday morning market at Portland, May 31, and netted me 9.40 for the good cows and over 10.40 for the good steers.

Fourth—The cost, including freight, feed expense, etc., was 1.03 per 100.

"Fifth—The day these were shipped and the day they were sold eight cents for cows and nine for steers were the very best prices offered by the California buyers.

"Sixth—My advice, backed up by experience, is to ship out if you are forced to sell now, and if not, hold cattle until August."

CONEJO RANCH DUROC SALE

The second day of Duroc bred sow offerings, that at Conejo Ranch, Newbury Park, seemed to afford cumulative evidence that midsummer sales of this character are not a thing to be made popular at the present stage of swine breeding operations in California. It is only the top animals of these midsummer sales that attract the attention of visiting breeders, and the local support for such offerings is sure to lag following the display of fireworks when the big breeders clash over the ownership of animals whose array of pedigree lines or other marks of high character make them much sought after.

A case much to the point is the sale of the noted show and brood sow, Great Wonder's Lady 5th, at the snug price of \$1,350. She was shown to have produced a truly sensational litter of pigs the present year, a litter whose selling value will no doubt double or treble that of the dam herself. She went to the bid of R. F. Talbot, Nogales, Arizona.

W. H. Dupee, owner of Edgemoor Farm, Santee, got his fine two year old sow, Inspector's Golden Beauty, bred to Giant Wonder, at \$300.

The detailed list of selling prices shows a sacrifice of values. It was for this reason, and from sheer lack of competition among buyers, that the sale management concluded best to stop the sale after a fair and square effort had been made to continue to the end. Following this a satisfactory deal was made for the sale of seven head of bred sows to one party.

0, Great Wonder's Lady 5th, R. F. Talbot, Nogales, Arizona, \$1,350.

1, Inspector's Golden Beauty, W. H. Dupee, Santee, \$300.

2, Belle Wonder 2d, Winsor Ranch, Bonita, \$175.

5, Mae Belle, Cy N. Clark, Modesto, \$65.

8, Lady Critic 4th, R. A. Scott, Fullerton, \$75.

10, Lady Model, Montana Land Co., Hynes, \$65.

11, Miss Carmen 3d, Montana Land Co., \$85.

15, King Orion's Mary Ann 3d, Montana Land Co., \$65.

19, Red Wing 1st, W. H. Dupee, \$160.
20, Red Wing 2d, Diamond Bar Ranch, Spadra, \$175.
29, Ellen 2d, Russell Bros., Triunfo, \$50.
33, Miss Model King 2d, Witt & Huey, Lankershim, \$150.

THE WINSOR RANCH SALE

The sale of Duroc-Jersey sows held by the Winsor Ranch, Bonita, at Los Angeles, Wednesday, July 28, was very well attended by breeders and hogmen from various parts of the state. The offering was first class as to type, individually and breeding, and was presented in ideal condition. However, the bidding was not very brisk and the buyers secured many bargains. The entire range of prices paid was very conservative.

The top of the sale was Miss Pathfinder 12th, the first prize senior yearling at the 1919 state fair. She was purchased by W. H. Dupee, Santee, at the record price on the coast of \$2,375. Mr. Dupee was the heaviest buyer in the sale and secured No. 2, the fine yearling Princess Pat, at the next highest figure, \$550, and in addition made several very good selections from the better part of the offering.

J. P. Walker, Visalia, was the next heaviest buyer, securing five choice young sows that will do much to improve his herd.

Col. Geo. Bell, Tulare, was on the block and was assisted in the ring by Col. Fred Gatewood, Fresno. These gentlemen handled the sale in a very efficient manner. Following is a list of animals sold:

- 1, Miss Pathfinder 12th, W. H. Dupee, Santee, \$2,375.
- 2, Princess Pat, W. H. Dupee, \$550.
- 3, Great Miss, C. C. Ellis, Exeter, \$150.
- 4, Model Rose, J. P. Walker, Visalia, \$350.
- 5, Anna, J. P. Walker, \$185.
- 6, Miss Minnie 2d, George Jr., Republic, Chino, \$100.
- 7, Winsor Lady Beauty, W. H. Dupee, \$95.
- 9, Model Fern 3d, Conejo Ranch, Newbury Park, \$105.
- 10, Vera, Witt & Huey, Lankershim, \$240.
- 11, Miss Minnie 3d, C. C. Ellis, \$240.
- 12, Bonita Girl, Conejo Ranch, \$175.
- 13, Belle Ardella, Diamond Bar Ranch, Spadra, \$100.
- 14, Model Hattie 2d, J. P. Walker, \$185.
- 15, Model Fern, J. P. Walker, \$200.
- 16, Proud Chief's 2d, Way & Son, Modesto, \$130.
- 17, Model Defender Lady 21st, J. P. Walker, \$190.
- 18, Model Defender Lady 23d, W. H. Dupee, \$225.
- 19, Orion Belle, W. H. Dupee, \$150.
- 21, Great Princess 1st, W. H. Dupee, \$100.
- 22, Cherry Blossom, \$300.
- 23, Model Jessie, W. H. Dupee, \$160.

CONEJO RANCH HAMPSHIRE SALE

The Conejo Ranch Hampshire sale, held at the ranch on July 30, was fairly well attended and a fine degree of popular interest manifested, notwithstanding the extreme heat of the day.

An element of interest attached to the presence of E. M. Harsch of Peoria, Illinois, representing the American Hampshire Swine Record Association.

With Col. Geo. W. Bell on the block, Fred Gatewood in the ring and Mr. Harsch as an all around booster, there was some quite effective team work done toward getting a fair appreciation of values as the sale progressed.

There was not a single outstanding high price paid for the day's offerings, \$200 registering the top, that being the price paid by A. V. Buell for the junior yearling sow Florein 4th, bred to Conejo Prince. C. J. Gilbert of the Tarzana Ranch, Van Nuys, was the successful contender for many of the more valuable offerings.

Josh L. Wilson Jr., an aggressive young lad of 14 years, was present to try his hand again at taking home with him to Lamanda Park some of his favorites.

Notwithstanding that low prices ruled for the most part in the two days sales conducted by the Conejo Ranch management, it was looked upon as effective pioneer work toward the popularization of the business of breeding the improved types of swine. Below is full list of all sale transactions:

- 1, Senator Maid 3d, Tarzana Ranch, Van Nuys, \$125.
- 2, Queen Allen, A. V. Buell, Carpinteria, \$175.
- 3, Senator Maid 2d, Tarzana Ranch, \$150.
- 6, Betty 2d, \$100.
- 9, Maud, Tarzana Ranch, \$125.
- 12, Jean, T. W. Middleton, Camarillo, \$85.
- 16, Anita Stewart, Fairbanks Ranch, Redlands, \$110.
- 19, Favorite 2d, Tarzana Ranch, \$175.
- 20, Susan, Tarzana Ranch, \$80.
- 22, Marguerita, Dream Wood Farm, Peoria, Illinois, \$100.

- 23, Florein 4th, A. V. Buell, \$200.
- 24, Florein 5th, Tarzana Ranch, \$160.
- 26, Senator's Beauty, F. A. Smith, Zelzah, \$100.
- 28, Bessie's Best, Russell P. Hall, Niantic, Illinois, \$100.
- 33, Jennie Messenger 3d, Tarzana Ranch, \$100.
- 34, Jennie Messenger 4th, A. V. Buell, \$80.
- 36, Miss Liberty 1st, Josh L. Wilson Jr., Lamanda Park, \$35.
- 37, Miss Liberty 2d, \$65.
- 38, Miss Liberty 3d, P. W. Penland, Moorpark, \$55.
- 40, Lillie 1st, Tarzana Ranch, \$75.
- 45, Beatrice 1st, \$50.
- 46, Beatrice 2d, Tarzana Ranch, \$60.
- 47, Beatrice 3d, \$65.
- 48, Beatrice 4th, \$40.
- 49, Helen 1st, C. G. Melners, Ojai, \$75.
- 50, Helen 2d, John Marwick, Santa Barbara, \$30.
- 51, Helen 3d, John Marwick, \$50.
- 62, Liberty Queen, Tarzana Ranch, \$70.

SCRUB COWS IN SOCIETY

The United States department of agriculture expects to exhibit a grade family consisting of a pure bred sire, a scrub cow and the grade offspring of this mating at the National Dairy Show to be held at Chicago in October, 1920. Some of the cattle clubs will also have similar exhibits.

The purpose of this feature is to interest the owners of scrub and low grade herds and to show in a practical way the manner in which such a herd may be improved by the use of a pure bred sire. This will do much to combat the prevailing idea that the National Dairy Show is of interest only to the owners of pure bred herds. It will help also to advertise the fact that the United States department of agriculture, through its "better sires" campaign, is offering cooperation and aid to the owner of poorest herd as well as to the owner of improved stock.

After all, Mrs. Scrub doesn't get into society on the strength of her own qualities; she is accepted purely on account of the merits of her mate and her progeny.

RAISING CALVES ON MILK SUBSTITUTES

The need for home raised calves has led to a search for a "milk substitute." While the feeds which have been tried have given some degree of success, there has not yet been found a complete or entirely satisfactory substitute for milk, says W. W. Swet of the Missouri college of agriculture. It is doubtful if any article or combination of articles that will completely take the place of milk in the diet during the first two months of the calf's life can be found.

There are a number of so-called milk substitutes on the market. Most of them are sold in the form of calf meal, and with proper care many of them will give good results. It should be clearly understood at the outset that calves raised on calf meal will not be as fat and sleek as those raised on milk. They will be growthy and healthy, however, provided they are given proper attention. Calf meals can be bought from local dealers at varying prices or they may be mixed at home if the proper ingredients can be secured.

A calf meal, in order to give success, should be made up of ingredients that are easily and readily digested and that are not too expensive. A few of the most commonly used materials are: fine corn meal, flour midlings, wheat flour (poor grade), ground rice, oat flakes, barley malt, cocoanut meal, linseed meal, flaxseed meal, cottonseed meal, blood flour, blood meal, and dried skimmilk or skimmilk powder. Skimmilk powder is not absolutely essential and it is rather expensive, but many of the calf meals that have given the best results have contained considerable amounts of it.

FIVE ANIMALS NOW COMPOSE AGED HERD

The Shorthorn aged herds at this year's state fair will consist of five animals instead of four, as in former years. The additional requirement is for a cow three years old or over which makes the Shorthorn herd identical with that of other breeds of cattle. Secretary Paine is sending notices to the breeders of the change, as a number of them have confused the conditions of entry in this class with the competition for single cows three years old or over. In the latter competition these cows must be shown with a calf dropped since January 1, while in the herd competition the cow may be shown whether or not she has a calf at foot, if she is otherwise eligible.

Hand Milking

versus

The De Laval Milker

Hand milking is not a natural process. Neither is it uniform nor regular.

Even the best hand milker does not milk the same every day—nor at every milking. It is a well-known fact that even the best hand milkers milk more rapidly and energetically at some times than at others, as the time of year and a man's physical condition vary his methods of milking. Matters of temperament and disposition quickly affect the cow and interfere with the secretion of milk.

The De Laval Milker, on the other hand, is regular, uniform, and positive in action at every milking. It milks the same at any hour of the day and every day in the year. This regularity and the alternating action at fixed speed, are agreeable to the cow and promote secretion and regular flow of milk.

The De Laval Milker also saves time and labor. In fact, one man with a De Laval Milker can milk three times as many cows in a given time as he can milk by hand.

The perfect sanitary features of the De Laval Milker are important. All parts that come in contact with the milk can be quickly and easily cleaned and sterilized. This is especially necessary in marketing certified milk.

Write to nearest De Laval office for Milker Catalog, mentioning number of cows milked

Third Annual Public Sale

60 Registered Shorthorns
105 Registered Shropshires
20 Registered Berkshires
10 Shetland Ponies

An opportunity to purchase foundation breeding animals from a breeding establishment that has grown famous through its sales of dependable purebreds at moderate prices.

This offering is without question the most desirable ever made from this ranch, and comes at a time when there is an especially keen need for better and more profitable purebreds on California farms.

Come to the sale whether you are a buyer or not. Last year a gathering of over 600 was made comfortable and preparations are being made for the crowd of 1000 that promises to be present this year.

CALEDONIA SHORTHORNS

Imp. Caledonia

Caledonia Shorthorns constitute one of the choicest collections of the breed owned in America. Our herd bulls, Imp. Caledonia, Gainford Matchless, grand champion at the 1919 San Francisco show and Pine Grove King stand out prominently in the West. Our females represent choice Scotch and American families, and are noted for their type and quality. We can at all times furnish foundation material and bulls suitable for any herd or for the range. Our prices are moderate and every animal is guaranteed. Visit our farm and herd. Send for special bull list.

"CALIFORNIA THE HAPPY BREEDING GROUNDS"

California livestock men are smiling over an unusual piece of news. It's a most decided "scoop" for a contemporary. Here it is:

"While the judging of Holstein cows in the arena of the California International Stock Show at San Francisco last fall was being delayed for the lack of one entry, few realized that the royal lady, Tilly Alcartra, for whom they were waiting, was just bringing into the world a son, who would bring buyers from four continents to bid for him, or that the price paid would mark the highest price ever paid for a youngster under six months of age at a public sale.

"Stepping proudly into the arena from which she was led with the blue ribbon, Tilly Alcartra returned to her young hopeful, who promptly scrambled to his feet, and, with waving brush, started to fulfill his mission on earth. Less than six months later he is knocked down to a bid of \$50,000 made by two buyers from Canada."

Interesting? Yes, and surprising.

But in order to keep the records straight we feel constrained to add that March 31 appears as the date of birth in the official records of the Holstein-Friesian Association. Further, in the interest of the aforementioned records, we might add that Tilly did not leave the show ring (in November, 1919, which was the date of the California International) amid a fanfare of trumpets and sporting the coveted blue ribbon. You see, Tilly wasn't shown in any class at the San Francisco show.

Tilly's "young hopeful" could not have been so stunned when he was knocked down for \$50,000, as when he read this chronicle of that event in his life when he "scrambled to his feet, and, with waving brush started to fulfill his mission"—and that five months before he was.

LOOKINGBILL MAKES BIG SALE

One of the big general livestock sales to be pulled off in the Pomona Valley section is booked by Col. W. C. Lookingbill at his Union Stock and Sales Yards on Tuesday, August 17, at 9:30. Col. Lookingbill has the facilities for handling a big diversified livestock sale. Two hundred and forty-five head will be offered. In the offerings are a fair sprinkling of pure bred and registered Holsteins and Poland Chinas. It is worth while to remember that this class of stock is not likely to sell at anything like its true value in a big general sale ring. The Holsteins are of high character in performance and show yard type. The Polands are of the big type, representing Superba and Long Smooth Jumbo blood lines. This sale event should witness one of the big turnouts of the season.

Veterinary**Caked Udder**

What is best treatment for caked udder?—Subscriber, Los Angeles.

Would recommend the application of hot and cold cloths intermittently. These cloths should be applied morning and night, the hot cloth remaining on two or three minutes and then the cold. The cloths should be put on for 15 or 20 minutes, or, better, a half hour at each application. Care should be taken not to burn the udder with the hot cloths. Immediately following the application of the hot and cold cloths the udder should be carefully massaged with some lubricant. Sweet oil with a small amount of turpentine added usually gives excellent results. This treatment should be continued for several days, or until the inflamed condition disappears. —G. E. G.

Stringy Milk

Have a cow whose milk develops into stringy milk after standing 24 hours or even less sometimes. The cream does not separate from milk readily but clings to it in a thick bluish mash. Cow is on green alfalfa and dry hay.—Subscriber.

Stringy milk has caused a great deal of discussion from time to time and has resulted in some investigation.

The Illinois experiment station has done some very good investigational work on this particular subject. Stringy, or ropy, milk as it is more often called, must not be confused with the results of garget. In most cases ropy milk is found to be normal when it is taken from the cow. The ropy condition is found to develop any time after about 12 hours. It seldom develops before that time, but may in 24 or 36 hours. So far as known, there is nothing in the ropy milk organism to make it harmful to the consumer. It is not desired, of course, and is not salable. The ropy milk organisms do not develop where there is a high percentage of acidity; that is, if the acid forming bacteria develop rapidly it will prohibit the development of ropy milk organisms, in fact, the practice of rinsing the utensils with sour milk has been used. This practice, however, is one in which the cure is worse than the ropy condition as it will cause the milk to sour very rapidly. The infection evidently comes from the utensils in which the milk is handled. The organism has been found in many cases in the water in which the utensils are washed. No other source of infection has been found in many cases although the washing of the cans in the creamery may infect milk cans of many dairies. To clear up this trouble, therefore, one should wash and carefully disinfect all utensils which come in contact with the milk. One of the best disinfectants found for this purpose is chlorinated lime; a 12 ounce can of good strength added to 200 gallons of water will make a very strong disinfectant solution. All pails, strainers, cloths, etc., which come in contact with the milk should be put in this solution and allowed to remain 15 or 20 minutes. The milk house should also be scrubbed with a disinfectant solution and a desirable practice is to whitewash the interior of the milk house. Live steam will also successfully control the ropy milk organisms. It is essential to disinfect all utensils, as the omission of one small dipper may reinfect all the utensils again. If the above treatment is carefully followed the outbreak should be checked.

PROTECT THE WOODS FROM FIRE

A tree will make a million matches — a match may destroy a million trees.

Take no chances with lighted matches, tobacco, brush, or camp fires.

Forest destruction is quick—forest growth slow.

Burned timber pays no wages.

When fire is discovered, put it out if you can. Get help if you need it.

Are you practicing fire prevention and forest protection?

Italian Vineyard Company Guasti Berkshires

Weaned pigs, both sexes, from sows that farrow large litters and raise them. Priced at a figure any farmer can afford and that will show him a profit.

BIG PUBLIC SALE OF BERKSHIRE SOWS AUGUST 14TH

Alex. Wilson, Supt., Guasti, Cal.

The Southwestern Berkshire Congress will hold a consignment sale of about 40 bred gilts and sows on the D. J. Bastanchury Ranch, August 14th, 1920, at La Habra. All animals guaranteed to be in pig. Big barbecue and good time. Pay us a visit and get acquainted before the sale.

Every Farmer, Dairyman and Pork Producer

Should Attend the Big Sale of

America's Greatest Breed of Swine—BERKSHIRES

Saturday, August 14, 1920

at the D. J. Bastanchury Ranch, La Habra, Cal.

30 Bred Berkshire Sows and Gilts Will Be Sold

Consider This:

Berkshire sows are prolific, are kind, careful mothers, heavy milkers and can be purchased at reasonable prices.

Berkshire Sows Raise Their Pigs

Thereby making them the most profitable. Berkshires are ready for the market most any time, make satisfactory gains on most

any kind of feed and under any and all conditions.

Berkshires are market toppers — they topped the market at St. Joseph, Mo., recently on which day 8,000 hogs were sold. Berkshires sold for 15 cents per hundred higher than any other and considerably higher than the average. This is an old story to those who have been raising Berkshires, but to you, who are just starting, it's an important piece of information you should know.

Money Value of Pure Breds?

O pure breds pay?

Once the old time dairyman said: "My old brindle cow can beat the huli bunch. She is good for two pounds a day and all the milk and butter the family needs besides."

That dairyman has passed and his place is taken by the man who makes his cows members of the cow testing association. He knows to the ounce their production of butter fat, and fortunately some of our dairymen are figuring as to cost in each and every one of these ounces. Present day feed prices force closer attention to the relation of cost to production, and that in turn forces closer attention to the particular animal that will make the most out of the high priced feed.

Of course the final question is: "Does it pay?" Here are a number of quotations from experts in animal husbandry:

The whole game of raising livestock depends on the ability to turn low priced feed into high priced meat and to make enough high priced meat when feed is high to still show a profit over cost of feed. The pure bred bull is the farmer's best guarantee that this can be done.—Oklahoma Farmer Stockman.

The trend of breeding and profits is certain to be downward so long as the sire is not superior to the dams.—American Farming.

Economic production is one of the surest and best means of maintaining a healthy volume of domestic trade and of meeting foreign competition. The use of better sires underlies efficiency in production.—"Better Sires; Better Stock" booklet.

There are innumerable examples of farmers whose prosperity has been founded on the production of pure bred stock. How many farmers do you know whose success is due to scrubs?—Edgar County (Illinois) Farm Bureau.

We have reached the period in national development when we should become ashamed of our scrub stock and demand as good as the best.—F. M. White, Alabama.

On the same day that native piney woods steers sold at the St. Louis market for \$12 per 100 pounds (the highest price ever paid for such animals up to that time), fat grade steers showing crosses of pure bred beef blood sold for \$15.25 per 100 pounds.

In Alabama a breeder has been using a pure bred bull for the last 15 years and his herd of 178 grade Herefords now ranges from one-half to fifteen-sixteenths pure bred. Practically one-half of his herd can scarcely be distinguished from pure breds. The yearlings now produced from high grade cows weigh 200 pounds more than native yearlings under the same conditions as to pasture and feed. The increase in weight has been brought about by continued use of a pure bred sire and the proper selection and culling of females.—U. S. Department of Agriculture.

The Georgia state college of agriculture has furnished the U. S. department of agriculture with the following striking example of improved breeding: At 15 months of age a heifer from a native scrub cow, sired by a pure bred Shorthorn bull, weighed 610 pounds. Its nine year old mature dam weighed 605 pounds. Although the heifer was but a half bred Shorthorn it quickly exceeded its dam in weight because of better breeding.

The first cross of a pure bred bull on the average dairy herd increased the income \$32 per cow per year, according to figures secured by the Ontario agricultural college, in comparison with 140 herds using grade bulls and 31 using pure breds. These figures show that if a farmer with 20 cows, using grade bulls, received an income of \$1,680, his neighbor with 20 cows who used pure bred bulls four or five years ago should receive \$2,320, or \$640 more. In other words, the man using a grade bull is paying a

tax of \$640 per year for this privilege. "You have to pay for a pure bred bull whether you use one or not."—F. G. Swoboda, Wisconsin.

There is no healthy cow so poor but that she will raise productive offspring if mated with the right kind of sire, and there is no cow so good but that it is possible to improve upon her greatness by mating her with a properly chosen bull.—Dairy Farmer.

The value of a pure bred dairy sire was well demonstrated on the farm of W. D. Gullledge. Five years ago he bought a good registered bull from a high producing herd and bred this bull to one of the grade cows. . . . They are milking heifers, from this bull, that are producing from 50 to 100 per cent more milk and butter than their mothers gave.—J. W. Cameron, County Agent, North Carolina.

The milk production of heifers out of ordinary cows and sired by Holstein, Jersey and Guernsey bulls increased over that of their dams by 64 per cent. The fat production increased by 52 per cent. The second generation increased in milk production over the original cows 130 per cent; in fat production, 109 per cent.—Agricultural Extension Service, North Carolina.

At the Iredell Test Farm, Statesville, North Carolina, the use of a good pure bred Hampshire ram increased the wool production in the flock of grade ewes from five pounds per animal to 8¼ pounds per animal the first cross. The improvement in mutton form was such as to add five cents a pound to the value of the lambs, which carried 50 per cent more weight than lambs from scrub rams.—Agricultural Extension Service, North Carolina.

In an experiment at the Missouri agricultural college 17 ewes were bred to a pure bred ram and 17 to a scrub ram. Eighteen lambs were produced in each lot. The lambs by the pure bred ram attained greater weights than lambs by the scrub ram in 75 per cent of the time, made these gains on 63 per cent as much grain and brought 75 per cent more money on the open market.—U. S. department of agriculture.

AN EXAMPLE OF PROLIFICACY

In the routine work in the office of the American Hereford Cattle Breeders Association attention is frequently focused upon the prolificacy of the Hereford cow. The 16th calf out of Emys of Lakeview, 153745, was recently admitted for record. Emys of Lakeview was sired by Halberd 117050 and out of Emys 64856, bred by Jno. W. Lenox of Missouri and owned by him until June 16, 1919, when Chas. C. Griffith of Iowa purchased her.

This cow was calved October 11, 1902, and dropped her first calf in March, 1905, when she was 29 months old. She is not yet 18 years old and has had 16 calves recorded as her produce, not having missed a year since her first calf was dropped in 1905. Of the 16 calves nine have been females, seven bulls, and two or three more calves may reasonably be expected from this good producer. If all the female produce of this cow, that is, if no females had been sold by Mr. Lenox, and none other than females tracing back to Emys of Lakeview, kept on the farm, barring accidents he would have had a herd at the present time of 145 females. Supposing the cow was worth \$200 to begin with, and each of her female progeny worth \$200, which is not an unreasonable figure, the herd would today be worth \$29,000, besides having realized returns from the bull calves during the 17 years.

The man who uses hook or line pulls in his single fish. But who join hands and pull a selue Get all that heart can wish. And each man's share is greater far. In size as well as weight. The secret of success is this—Co-op-e-rate.—Associated Grower

August 11, Butte City Ranch.

August 14, Southwestern Berkshire
Congress, D. J. Bastanchury Ranch, La
Habra.The La Honda Land Company, La
Honda, has recently purchased from
J. F. Lehman, Lodi, ten Poland China
fall gilts sired by Smooth King Kor-
ver.The Stanislaus County Holstein
Breeders Association will hold a sale
of strictly high class breeding and
show cattle at the close of Patterson
fair on Saturday, August 21. These
cattle will be shown in the various
classes during the fair and then be
offered for public appraisal. They
were selected by a committee of three
breeders and in many instances will
include individuals that could not have
been purchased at private treaty.Countess of Heggles 3rd, a Shorthorn
cow owned by Innisfail herd, Davis,
California, gave more than a ton of
milk for the month of May and leads
the cows reported to the Milking
Shorthorn Society, Independence,
Iowa, in milk and butterfat yield for
the month. She gave more than a
ton of milk in April. The leading two
year old heifer is Princess Fallpail,
also of the Innisfail herd.During the quarter just finished, 114
Aprshire cows qualified for the Ad-
vanced Registry with an average pro-
duction of 10,731 pounds milk, 429.92
pounds fat testing 3.98 per cent fat.H. P. Slocum and Son, Willows, have
recently made two important sales
from their herd of Durocs. E. D. Con-
nolly, San Francisco capitalist, who is
developing a large ranch near Wil-
lows, purchased the tops of the Slo-
cum show herd. In the lot were in-
cluded three senior yearling sows that
are half sisters to Uneeda Invincible
Col, junior champion at the 1919 state
fair; Uneeda Invincible Queen, dam
of the above boar; a littermate to
the 1918 junior champion boar; a sis-
ter to the senior and grand champion
sow of 1918, and one of her daughters;
two line bred Defender sows and a
Grand Model sow. It goes without
saying that with such a foundation
the Connolly herd, under the manage-
ment of R. W. French, should come
to take an important place in the af-
fairs of the breed in this state. In
this connection it is of interest to
know that the plans of Mr. Connolly
include a high class herd of Holsteins
and that a start has been made toward
assembling a herd. The Connolly ranch
is located about six miles north of
Willows and is being equipped with
modern buildings.The Meadowbrook Stock and Dairy
Ranch, near Edgewood, Siskiyou Coun-
ty, owned by A. J. Clark and managed
by George Hansen, has recently en-
tered the ranks of the Duroc breeders
and is planning to have one of the
good herds of the North. Since April
they have selected from the Slocum
herd about 50 head of sows, their most
recent purchase including the boar
Uneeda Invincible Col, junior cham-
pion at the last state fair. They also
selected the second prize senior year-
ling sow of 1918 and a part of the
1920 show herd, among which were
three daughters of the good producing
sow, Uneeda's Model Queen 4th, a sis-
ter to the junior champion of 1918 and
a sister to the senior and grand cham-
pion sow of 1918.In a recent letter from Ansel M.
Easton of the Blackhawk Ranch,
Diablo, the following interesting news
is contained: "Mr. and Mrs. Ward
and Manager Lovell are at present in
Scotland looking over the Shorthorn
situation, and they are going over the
ground very carefully before buying.
They write that the cattle at the Scot-
tish shows are very high and no bet-
ter than our own. However, they ex-
pect to be able to assemble a ship-
ment of the kind that we want. The**Ask

Wards expect to be home in time for the state fair, but it is doubtful if Teddy arrives with the cattle before late in the year, as it appears that he will be able to ship from Glasgow direct to San Francisco via the canal."

An Associated Press dispatch reports that The Yankee, the Poland China boar recently purchased by W. H. Ellsworth & Sons, Goldfield, Iowa, from Williams Bros., Villisca, at the record price of \$40,000, has died. The Yankee has been rated as one of the greatest Poland boars of the present day. He was the sire of The Rainbow and other high priced and great show and breeding animals. He was also a littermate to The Pilot, grand champion of the last National Swine Show. His death is a hard blow to the Poland China breeding industry, as such boars as The Yankee are all too scarce.

One of the largest sales of grade cattle held this year is that of the Los Posos Land Company at Corcoran. The owners have spent considerable time and money in building up what is considered one of the very best herds of grade cattle in the state. Nothing but the very best that could be obtained in pure bred registered Holstein bulls has been used at the head of the herd, and when one looks over the beautiful dairy type of the females he will appreciate what breeding does in a grade herd. The owners have decided to put their large holdings into cotton and are plowing up their alfalfa. Otherwise this splendid dairy herd of 500 head would never be placed on the market. This sale will offer buyers a rare selection of grade Holsteins. It's a Rhoades sale.

W. H. Rough, Arlington, reports that the four year old Jersey cow Mabel's Raleigh's Figgis, is now completing a test of above 600 pounds of butter in one year. Lady the 1st of Rough Farm, with first calf, is making two pounds fat per day. A beautiful string of 12 registered heifers, bred and reared on the farm, are now bred for first calf to the herd bull, Merry Maiden's Conquest, he by Merry Maiden's 3rd Son.

Jersey cattle and Duroc-Jersey swine are a part of the mixed farming venture of C. J. Daily & Sons at Camarillo, Ventura County.

James Marwick is the owner of Braemer Ranch, Santa Barbara. The ranch is now well stocked with Percheron horses and Aberdeen Angus cattle.

Grant A. Brown of Eastman Farm, El Monte, plans to show again at the big shows this year with a string of young Jersey cattle of his own breeding.

Sixty-two Guernseys from Edgemoor Farm, Santee, were sold at Waukesha, Wisconsin, July 22, for an average of \$962. The famous bull, Imp. Itchen May King, and 29 of his daughters were features of the sale, the former selling to F. E. Fox and Goodhand Kingston & Son of Wisconsin for \$6,100. Twelve of his daughters averaged \$1,012.50 or more. Imp. Donnington Goldie 5th, first prize cow at National Dairy Show in 1917 and 1919 and third cow in Class E with a record of 796.52 pounds fat, was highest priced female. F. J. Reuping of Wisconsin made the last bid of \$5,200. This is the highest valuation yet placed on a Guernsey cow in the Waukesha sale pavilion.

O. M. Plummer, general manager of the Pacific International Livestock Show, to be held at Portland, November 13-20, has announced that over \$53,000 in premium money will be offered in the various classes.

Swine exhibitors at the state fair will be interested to learn that Prof. L. A. Weaver, who is to tie the Poland China and Duroc classes, has been invited to judge Polands and Durocs at the Illinois state fair and to serve as one of two judges for Durocs at the National Swine Show.

R. C. Gruhlke, Berkshire breeder near Dixon, has recently sold a trio of pigs to Chile.

We regret to announce the death of Fresno Boy, the Poland China boar owned by Fred Gatewood, Fresno.

This boar was a son of Orange Boy and a half brother of The Pickett. He had a record in the show ring, being first in class and junior champion at the last state fair. He was being fitted for this year's show.

The Milk Producers Association of Central California has not yet managed to get members together on a collective marketing plan, but will hold another meeting on August 14 at Modesto to try to arrive at some definite decision.

BERKSHIRE BREEDERS EXPECT-
ING GOOD SALE

By Bruce S. Bennett

The Berkshire breeders are enthusiastic over their prospects for a good sale Saturday, August 14. They have planned this sale for the benefit of those desiring to secure one or more good Berkshire sows, and the animals have been consigned by some of the state's leading breeders. Both the farmer and pork producer of California are showing unusual interest in Berkshires and are fast recognizing the Berkshire sow as a profitable investment. This is due, no doubt, to her ability to farrow large litters and raise them. The one thing that Berkshire breeders recognize is that there is a limit to the price a farmer can afford to pay for sows and they have determined to keep the price of Berkshires within reason, either at public or private sale. The sale will be held at the D. J. Bastanchury ranch, La

FAIR DATES

Napa County Fair, Napa, August 19-21. Harold E. Smith, Manager.
Sonoma County Fair, Santa Rosa, August 25-29. Secretary J. Francis O'Connor.

Habra, starting promptly at 1:30 with Ben S. Rhoades as the auctioneer.

The sale will be preceded by a big free dinner, and arrangements are being made to care for a large crowd.

DIAMOND BAR IS GROWING

Secretary Hopkins of the Fred Lewis Diamond Bar Ranch at Spadra has just returned from some of the Duroc centers of the Middle West. He has seen some of the greatest specimens of the breed produced on Diamond Bar since its beginnings, but he wished to see the Reds at home. He is now back and more enthusiastic than ever. Arrangements are now made for continuing the work of Diamond Bar along Duroc lines by securing R. K. Walker, president of the State Duroc-Jersey Breeders Association, as manager of the swine department of the ranch. Mr. Walker has been manager at Fontana and at Winsor and has stuck consistently by the Durocs. He starts here with a string of grand champions, some from the National.

Mr. Lewis will spare no pains in building up a still greater herd than Diamond Bar now possesses.

DISASTROUS FIRE

During the afternoon of July 29 a disastrous fire occurred at the university farm, Davis. The 350 foot bull shed just west of the large dairy barn was completely destroyed. Four valuable dairy bulls perished. One of the bulls was an Ayrshire that had been loaned the university by J. Henry Meyer of San Francisco, and one, a six year old Jersey, You'll Do Oxford Lad, had been loaned by J. E. Wherrell of Riverside. For a time it appeared that the main dairy barn, the judging pavilion and the horse barn would be destroyed, but ample water pressure saved these buildings. The origin of the fire is not known.

Diamond Bar Durocs

Double Your Dollars

ACE OF PATHFINDERS

This great boar headed the World's Grand Champion Duroc herd at the 1919 National Swine Show; also the first prize get of sire herd. All animals in both herds are owned by us.

He was Grand Champion at the Los Angeles Livestock Show and stood second to the world's grand champion at the National.

He is by Pathfinder, out of Hiawatha, by Crimson Prince, and, besides his show ring record, he is considered one of the greatest sires of the breed.

Buy These Breed Improvers

Now that we have decided not to hold a summer sale, we are ready to offer at private sale the greatest array of Duroc breeding and individuality ever put before California buyers. We have culled closer than ever this season, and every animal not fully up to the high Diamond Bar standard has been sent to the fattening pen. And those that remain—say, man, they are real ones!

No matter whether you want a foundation herd, new blood for an established herd, or simply a boar to breed up a grade herd, we can satisfy you from the world's largest Duroc herd. While quality is high, our prices are reasonable, and every animal is sold under a guarantee of complete satisfaction. Call or write.

Working Capacity

The "Caterpillar" Tractor is more often purchased on the basis of its actual working capacity than on mere horsepower ratings. It is for that reason that it is so generally chosen in preference to other tractors of higher nominal rating. Big working capacity is the result of a liberal surplus of power over its rating, minimum transmission losses, non-slipping track, trouble-free performance.

Fattening the Cockerels

By Jean A. Koethen

THE American farmer comes in for a good deal of criticism because of the condition in which he markets his table poultry. Possibly the criticism does not apply so much to the specialty poultryman as to the farmer, and yet I remember hearing Edward Brown, the English poultry writer and lecturer, say, after some months in the United States, that our lack of good table poultry was conspicuous. For one poultryman who takes time to properly fatten and finish his cockerels there are 20 who let them go to market after either a desultory attempt at fattening or none at all. "The people of the United States," says H. Armstrong Roberts, "are probably the greatest consumers of poultry and eggs in the world, and yet we are said to be satisfied with a very poor quality. The average quality of chicken seen in the retail stores and on hotel tables in this country is far below that found in France, England, Belgium, Denmark and so on. This is largely due to the great consumption of broilers, which, however good they may be in some respects, lack the tenderness and abundance of flesh found on fowls that have been properly fattened before killing. In fact, as a general practice the fattening or finishing of poultry by special processes is virtually an unknown industry in this country."

Fattening Feeds

Oats, corn, barley and wheat middlings are the feeds generally used for fattening. Corn is not considered sufficient, because, while it does add weight quite rapidly, the weight consists mainly of a deposit of oily fat in layers under the skin and in masses in the abdominal cavity. The "corn-fed" chicken is a good seller, but not so good as the "milk-fed," which has been fattened on a combination of corn and other ground grains, the mixture being moistened with sour or skim milk.

The fattening feed, whether the birds are in crates or in small pens, must always be soft. If milk is not available the ground grains are moistened with water, but milk makes a far better table bird. When milk and a combination of grains are used, the fat, instead of being in layers, is distributed in tiny globules throughout the tissues; consequently in cooking it is not wasted, but makes the tissues soft and juicy. Ground barley or oats, with one-third corn meal, thoroughly moistened with sour milk into a pasty mixture, makes a splendid fattening feed. Another good fattening ration consists of 100 pounds corn meal, 100 pounds wheat middlings and 40 pounds animal meal, which takes the place of milk. Still another mixture, which is recommended by the Ontario agricultural college, consists of two parts corn meal, two parts ground buckwheat and one part pearl oat dust, with an equal weight of skim milk.

Crate Feeding

While crate feeding is not practiced to any great extent by poultrymen themselves, it is practiced at a good many big feeding plants east and west, and always with a most gratifying gain in weight and palatability. At one such plant, where 134 Barred Rocks and White Wyandottes were fed three weeks on ground oats and sour milk, the average gain in weight was one pound, 13 ounces. It took 2 pounds 14 ounces of grain and five pounds 12 ounces of milk to produce one pound of flesh. At another plant 12 Buff Orpingtons, fed on a ration of 100 pounds ground oats to 220 pounds milk gained two pounds each in three weeks. Feeding records show that on the average it takes three pounds five ounces of grain and six pounds three ounces of sour milk to make one pound of new flesh. Just what gain there would be in feeding for this additional pound in weight must depend, of course, on the cost of feed and the price received for the pound of flesh.

Poultry fattening has been recognized industry in England for 400 years, and has been especially developed in Sussex. "The Sussex method," says Frank C. Hare in "Secrets of Crate Feeding," "is to take chickens from two and one-half to

three months old weighing about three pounds each. They are put in slat crates six feet six inches long by 16 inches square inside. The slats in front are sufficiently far apart to allow the birds to put their necks out. The floor is made of slats so that the droppings fall to the ground, and thus keep the crates clean. The crates are elevated above the ground, are usually made with three compartments and hold from 12 to 15 chickens. In front of each crate is a V-shaped trough suspended by hooks. This is on a level with the floor, and the chickens put their heads through the slats and feed from the trough. The elevation of the crates is three feet." Ground oats with a small percentage of barley, in the proportion of one sack of barley to eight sacks of oats, moistened with sour milk, is mostly used for the fattening feed. The fattening is continued two weeks, and then the chickens are finished by the cramming process. This Sussex method, without the cramming, is the one generally followed, with some minor changes, in Canada and the United States.

How To Do It

Mr. Hare thus outlines the method to be followed in crate feeding:

First, dust the birds thoroughly to make sure there are no lice on their bodies. Lousy cockerels do not fatten well.

The crates used should be 18 inches high, 16 inches wide and divided into two compartments two feet long. Such a compartment will hold four chickens weighing from three to four pounds each or six smaller ones. The front is covered with slats three-eighths by seven-eighths and spaced two inches apart. Each compartment may have either a sliding door in front or a hinged door on top. The floor is covered with slats one-half by seven-eighths inch running lengthwise. The slat nearest the back of the crate is placed two and one-quarter inches from it, and the other slats are one and one-half inch apart. They should be in a quiet place where there is plenty of fresh air. Out of doors in summer is very satisfactory.

The first week in the crate the chickens are fed sparingly. They are given water in the troughs as soon as they are put in, and then are fed nothing for 12 hours. A quantity of the mash is then spread along the trough, and as soon as this is eaten a little more, but not nearly as much as they would like. Feed the mash thin like porridge, so it will drop but not run from a spoon, three times a day. Give fresh water daily and grit twice during the week.

The second week is the flesh maker. The chickens are given mash liberally twice a day, as nearly 12 hours apart as is practicable. Twenty minutes after feeding begins the troughs are cleaned and turned over.

The third week is the finishing period. For extra fine finish melt one pound of mutton tallow for each 50 chickens, and while hot, stir it into the dry meal. The resulting paste is then mixed with the mash. The tallow increases the globules of fat through the flesh and produces greater juiciness. This week, as in the second, the birds are fed all they will eat twice a day.

Tested Rations

The following rations from successful feeding trials have been found to make profitable gains. They are divided into two classes: rations in which the ground meal is wet with sour milk or buttermilk and rations in which water is used. If white flesh is desired no yellow corn is used in the mash. If yellow flesh is wished yellow corn is always part of the mash.

For producing white flesh we may use 100 pounds ground oats moistened with 150 pounds milk; 40 pounds ground oats, 20 pounds ground barley, 40 pounds low grade flour or middlings and 150 pounds milk; or 50 pounds ground oats, 40 pounds ground white corn, ten pounds low grade flour or middlings and 150 pounds milk.

For yellow flesh, use 40 pounds ground yellow corn, 40 pounds ground oats, 20 pounds flour or middlings and 150 pounds milk; or 50 pounds ground yellow corn, 40 pounds ground oats or

barley, ten pounds flour or middlings and 150 pounds milk.

For producing white flesh without milk, use 50 pounds ground oats, 30 pounds flour or middlings, 20 pounds ground corn, ten pounds alfalfa, six pounds blood meal. For yellow flesh, use 40 pounds ground yellow corn, 30 pounds ground oats, 30 pounds flour or middlings, ten pounds alfalfa meal, six pounds blood meal.

Instead of mixing the meat meal in the mash, it may be fed separately at an additional meal, and another meal of greens or raw vegetables given. This, with the two meals of mash, would make four meals daily.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST

By Max Kortum

Santa Cruz: For the month ending July 16, the 337 contesting hens laid 5,694 eggs, or an average of 16.8 per hen. R. C. Gibson of Newhall won the title for the month with a production of 211 eggs for his pen. D. B. Wallis of Petaluma is still leading the contest with a total production for his pen of 1,563, while his hen number 16 crossed the 200 egg mark during this month and now has a total of 209 eggs for the period of 243 days. The molt is gradually beginning to make inroads in the flock and from now on each week will show less hens laying. The average for the flock up to date is 126.2 eggs per hen, or about 52 per cent production for the full eight months.

The board of directors of the California Farm Bureau Egg Laying Contest have received the support of the chamber of commerce and business men of Santa Cruz, who have pledged \$10,000 to carry out the plans of giving to California its first permanent International Egg Laying Contest. This year's work has been limited only to the state, but the new contest plant, as planned, will have a capacity for 1,200 hens and will be open to entries from every state.

Leading Pens to Date

White Leghorns: Wallis, 1,563 eggs; Rose, 1,497; Enterprise, 1,495; Gibson, 1,473; Bellows, 1,454; Peck, 1,425; Gibson, 1,408; Wood, 1,383; Neef, 1,383; Amsbaugh, 1,373; Barker, 1,361; Wilson, 1,359.

Leading Individuals to Date

White Leghorns: Wallis, 209 eggs; Walls, 186; Peck, 181; Barker, 181; Webb, 180; Rose, 178; Enterprise, 178; Enterprise, 178; Gibson, 178; Neef, 177; Pasquale, 177; Gibson, 176.

Alternate hens: Pasquale, 196; Gibson, 182.

Average food consumption per hen for month: Mash, 3.53 pounds; grain, 3.20 pounds; green feed, 4.4 pounds.

For the past week ending with July 24 the hens laid 1,260 eggs, or an average percentage of 53.5.

High Pens Week

Barker, 48 eggs; Gibson, 48; Gibson, 48; Bellows, 47; Neef, 47; Stalling, 47; Wood, 46; Schlink, 45; Clark, 44; Peck, 43; Enterprise, 43.

STORAGE EGGS

There is no reason why storage eggs should not be as wholesome and appetizing as any other eggs, but they are not—often, at least, they are not. The Literary Digest has been asking why this is the case and quotes from a writer on foods and markets, and here is a part of the discussion it develops:

"What we want is an edible egg, free from the seeds of decay and untainted by the absorption of rank flavors. All this an eight months storage egg may be, if properly handled; whereas a 'new laid' egg that has passed 24 hours in insanitary conditions, hot, moist and dirty, may embody all the objectionable features hinted at above.

"The food which the hen eats sometimes affects the flavor of the eggs; it also affects the color of the yolk, which takes on a deeper yellow tint when the hen has eaten an unusual quantity of grass or other green food. Because the hens are in better physical condition during the spring, the eggs laid at that time are apt to have a firmer interior structure and keep better than those laid later in the year. A new laid egg may be small or dirty or thin shelled, but these faults are to be laid at the door of the farmer who disregards breed, feed and clean laying quarters for his hens.

"Because of the readiness with which eggs spoil, the term 'fresh' has become synonymous with the idea of desirable quality. Contrary to the popular notion, however, the actual age of an egg is relatively of much less importance than are a number of other factors which affect its quality. No egg which has been held for even a short time is quite as good, of course, as one which is freshly laid. But an egg 48 hours old that has lain in a wheat shock during a warm July rain or has been gathered by the farmer's wife when it was wet and dirty and then kept in a warm kitchen would probably be swarming with bacteria and be unfit for food, while another egg kept for eight months in a first class cold storage room would be entirely edible and of fairly good quality. The promptness with which an egg reaches the consumer after it has been laid is no guaranty of its quality unless it has been handled properly while in transit.

"Since all the ills connected with moisture, heat or objectionable odors may develop in an egg within a very short period if its environment is unfavorable, it follows that the mere time which has elapsed between the laying of the egg and its arrival with the consumer is not an adequate or proper test to be used as the sole determinant of what constitutes a truly 'fresh' egg. The only real test is the interior quality, and this cannot be determined with certainty until the egg is broken. Temperature, however, is the most important factor affecting this interior quality, and, unless its other surroundings have been unusual, the egg which has been under low and favorable temperature throughout its career will have deteriorated but slightly and will remain a good usable egg for a very considerable period.

"Much of the bad reputation which storage eggs have gained is ill founded. The mere fact that an egg has been held several months in storage does not mean that it has deteriorated to any great extent, for its quality at certain times of the year is actually apt to be better than that of the average 'fresh' egg arriving on the market. The unpleasant flavor usually acquired by a cold storage egg may or may not be sufficient to injure its use for most forms of cooking, depending on the conditions under which it has been stored. Lastly, an egg which has not been in storage over seven months is not apt to have acquired a sufficient flavor to be objectionable nor to have deteriorated enough to affect its wholesomeness or edible qualities."

Single Motor

25 Horsepower

One Manpower—1-6 H.P.

Pumping 1000 Gallons Per Minute

This installation of a Vertical G. E. Motor connected to a Deep-Well Turbine Pump is operating at 1150 R. P. M. and pumps 1000 gallons per minute from a well 50 feet deep and 12 inches in diameter.

This one pump installed on a ranch at Santa Clara, Calif., is of ample capacity to irrigate 40 acres of prunes and in fact could easily supply 50 to 60 acres.

When selecting motors it is always well to remember cost is not price in the beginning, but cost in the long run.

The electric way is the modern way — the proven economical way.

DEHYDRATION OF FRUITS
(Continued from Page 149.)

sun dried article. The cost for fuel was light. About 4.3 gallons of stove oil per hour at eight cents per gallon was used; or this represents a cost of about \$1.38 per green ton of fruit. The drying ratio for the entire quantity of fruit dried was about 5% : 1. Sun drying gave slightly lower yields of dried product than did dehydration, but this was evidently due to lower water content of the sun dried fruit. The very low fuel cost in our test was obtained by recirculation of most of the air used in drying and by use of an efficient heating system. Too low humidity of the air used in drying caused case hardening and slow drying.

Recently the writer has seen apricots evaporated on the Teluca ranch near Lankershim without sulphuring. This fruit was dead ripe and of good flavor when cut. The dried fruit possessed a brown skin and golden brown to yellow flesh. The flavor was most excellent and much superior to that of the ordinary sulphured dried apricot. While not so attractive in appearance, the product is superior in eating quality to the sulphured fruit. We may, therefore, expect it to attain great popularity.

Prunes

Our best results of last season clearly demonstrated that prunes carefully evaporated possessed a flavor superior to that of the sun dried article. This fruit was dried in about 18 hours in the evaporator at the university farm and in from eight to 14 hours in our small laboratory size evaporator. Dehydrated (evaporated) prunes have a light colored flesh and a fresh fruit flavor. They "come back" rapidly and well in water and are easily cooked. Further data are needed on the relative costs of sun drying and evaporation of prunes. We believe labor costs are less with the evaporator, but this saving may be counterbalanced by the cost of fuel. An evaporator and trays cost no more than a sufficient amount of sun drying trays to care for the same amount of fruit.

Vacuum Dehydration

There has recently been revived a keen interest in the drying of fruits under a vacuum which permits very rapid drying at temperatures so low that the fruit is uninjured by heat and closely resembles the fresh fruit in flavor. The method had not been attempted upon a commercial scale until very recently. A \$200,000 corporation has recently been formed at Lodi to erect and operate at that place a vacuum fruit dehydrator of larger capacity than anything of a similar sort heretofore attempted. The machine is continuous. Fresh fruit enters the top of the machine continuously and the dried product issues from the bottom. We shall await with much interest the future development of this proposed plant.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Fence Not on Line

In 1914 A filed on homestead and had a survey of his lands made. In 1915 B filed homestead on adjoining land and built line fence upon part thereof. In 1918 B built line fence on the remainder of the adjoining boundary line, at which time he discovered the corner was six feet over on his line. Can this now be corrected by having proper survey made?—Subscriber, Palmdale.

It would seem that the building of the line fences was merely a matter of mistake in respect to the location thereof, in which there has been no agreement and no sufficient acquiescence to indicate an agreement, and therefore the location of the fence could undoubtedly be corrected by a proper survey.

Wages of Cook

Husband and wife take work on farm for certain wages. The agreement is distinct that wife shall cook only for the employer when there are no extra men. Employer finds that he can only hire men where cooking is done for them. For about 40 days the wife cooks for about five laborers. Is she entitled to wages for her work? If so, how much? Employer knew that wife expected something.—Subscriber.

The conditions of the employment appear to be clearly stated. The wife has done additional labor, for which there was a mutual expectation that she would be paid. It is, therefore, clear that she is entitled to recover the reasonable value of those services on an implied contract. What the reasonable value of such services might be is entirely a question of fact, in

which the prevailing rate of employment for such services in that community would undoubtedly be controlling.

Transferring Property to Wife

Husband and wife, married 30 years, have worked hard and saved a home which is in the name of both husband and wife. Husband is now ill. Will a deed of his interest to the wife be sufficient to transfer the property to the wife? There are children, all married. How may the furniture and other personal property best be protected?—Subscriber.

A deed of the interest of the husband to the wife, duly executed, acknowledged and delivered would probably be sufficient. The far better way, however, would be to acknowledge and file a joint declaration of homestead. In order to afford absolute security there should also be a will, drawn in favor of the wife, wherein the children are mentioned.

MOTOR TRUCKS FOR SHORT HAUL

All sections, instead of particular sections, must adopt motor transportation for short hauls before its greatest benefits will be felt by the country at large, according to the recently expressed opinion of many transportation men. Even the sections which have motor transportation do not feel its benefit to the full extent, the experts are pointing out, so long as many sections are without it.

An excellent illustration of this point of view is found in California this summer, as E. Farr, director of the Firestone ship by truck bureau of Akron told highway transportation men at a recent conference.

"California," he said, "has a fairly good system of motor truck routes. Right now probably 60 per cent of all local intercity freight in the southern part of the state is shipped by trucks. Yet it is estimated that approximately 60 per cent of the perishables grown in the great Imperial Valley will rot in the fields because of lack of transportation.

"The trucks can transport to meet local demand, but when this demand has been met 90 per cent of the crops of the valley remain. This 90 per cent generally is exported to other states. This exportation involves long hauls. It requires 11,000 freight cars. This year the growers are unable to get anything like that number. Instead of the required 500 to 700 cars daily they are getting only 200.

"Now if a majority of the production areas of the United States had motor truck facilities equaling those of Southern California, that section would not be in this predicament. Instead, freight cars that are today tied up all over the country on slow short hauls would be relieved of this duty by motor trucks and assigned to this and other long haul freight carrying, where they are much needed.

"This but illustrates once more our point that transportation needs a new axiom. That axiom should be: To the railroads, the long haul; to the motor trucks, the short haul. It is uneconomical surely to give freight cars, as valuable as they are, a job which can be done better by motor trucks, just as it is uneconomical to give motor trucks the long haul business when that business can without a doubt be done better by the railroads."

LAFAYETTE FARM CENTER ADOPTS FIRE FIGHTING PROJECT

At a meeting of the Lafayette farm center of Contra Costa County, held July 20, at which more than 80 residents of Lafayette and vicinity were present, it was unanimously decided that the section is in dire need of more adequate fire fighting equipment and that steps should be taken to procure this equipment. J. J. Boyer, who was elected director of the center, appointed a committee of five to canvass the territory for subscriptions with which the necessary equipment may be purchased. The committee decided that for \$750 the present equipment can be motorized and additional chemical extinguishers obtained. As Lafayette has suffered from eight fires within the last six weeks, it was anticipated that this project will receive the support of all the residents of Lafayette and adjacent territory.

WORDS

How I love the mere words, the picturesque and dear words,
Romany and Patteran and Caravan and Chai—
How they lit and sing to me; flame-lit, how they bring to me
Heathered moors and bending skies and gypsy carnival.

The sun-swept and the wild words I dreamed of as a child, words
Like Lariat and Chaparral, Coyote, Pinto, Sage;
How they flung a dare to me of life without a care to me,
How the flying hoof-beats rang across the printed page!

The lantern-lit, the old words, the scarlet and the gold words,
Palfrey, Jerkin, Yeomen, Falcon, Glebe and Glade;
Minstrel, Lance and Tourney—what an age-long journey
Through the posters of the Past, alone and half-afraid.

The wind-blown and the sea words, the lawless and the free words,
Splndrift, Doubloon, Cutlass, Jib, Corsair, Yardarm, Crew;
Whispering wild tales to me, ah, how each unvels to me
Palm-fringed islands rising green against the ocean blue!

The balsam-scented North words that call untamed hearts forth, words
Like Wanigan and Mackinaw, Duffel, Tumpine, Trall;
While the languid South to me turns a lover-mouth to me,
Jasmine-scented, passion-flowered, by the Bayou pale.

Some may live their fair dreams, costly, jeweled, rare dreams;
Some may rove the luring world as free as homing birds;
But still I'll find my all for me, close-waiting at my call for me,
In my printed palaces, bright-tapestried with words!
—By Martha Haskell Clark in Youth's Companion.

A HOUSE FOR RENT

(Continued from last week.)

Across the railroad track which skirted the edge of town stood a row of dilapidated little houses owned by a shrewd business man named Stanard. Ran noticed a sort of stir in front of one of them, and paused near enough to overhear the loud, emphatic tones of a red faced individual who seemed to be directing matters.

"You got to get out, all right!" he was saying to some one within. "The boss has sold this whole block of houses. You knew when you came here that this was likely to happen."

A pale young woman stepped out, a baby in her arms. "But you surely won't turn us out today?" she urged. "My husband is just recovering from an illness and we really haven't a place to go!"

Boy as he was, Ran recognized the terror in her face, and the heroic effort she was making to steady her voice.

"It's like this, lady," Stanard's agent said uncomfortably; "this deal went through yesterday on condition that immediate possession could be given."

"But you owe us some notice!" protested the startled woman.

"Yes," callously, "and you can take it up in the courts later, if you like, but you'll have to move today, all right."

In sick despair the girl came down off the little porch and stepped closer to her informant.

"Can you tell me of any place where I can find shelter?" she asked. "My husband had shell shock overseas, and is just getting well. We have so little money until he can get back to his work"—she paused uncertainly.

Sanders was not a brutal man, but he was required to carry out the orders of a hard master. He cleared his throat. "I'm sorry, lady, but my orders are to get this row cleared out before dark. New parties will be moving in tomorrow. You could get the Associated Charities to help you."

At his answer the slim shoulders straightened. "That will do!" the young woman said. "Come back in an hour or two and we will be gone." Ran's hands tightened convulsively on the handles of his pushcart. He stepped across the narrow road as Sanders took himself off, and called breathlessly to the retreating figure.

"Oh, I say! May I speak to you?" The young woman turned on him a face he had never forgotten. "Haven't I seen you before?" he stammered.

"I'm Jessie Mallard—I mean Mrs. Harvey Douglas," she answered.

"I saw you once when I went over to the academy for a game," Ran said shyly.

A bright flush ran over young Mrs. Douglas' face; "I am the niece of Major Mallard," she said briefly. "I married just before Mr. Douglas went overseas. Uncle Jimmie objected, and I haven't let him know what a hard time we have had. I'll have to, now," she faltered, and two bitter tears fell down her cheeks in spite of herself.

"You come with me," Ran said firmly. "My brother Sam and I have a house fixed up in our back lot. We did it for—for a sort of joke"; he swallowed hard. "You let me put your trunk and things in this cart and take them right over. You can stay till you find something better."

Mrs. Douglas looked from the sleeping baby to the shabby little cottage window through which she could see the thin form of her convalescent husband, sheltered by his slight deafness from knowledge of what was going on without.

"It seems too good to believe," she said simply. But in a very little while it was an actual fact. The things to be moved were pathetically few. The Douglasses had been only a month in the little cottage, and only the barest necessities were theirs.

Matters were explained to young Douglas, the wife putting a brave face on their enforced move. With the convalescent soldier's help, Ran managed to transfer their effects to his house as dusk fell.

Sam sat before the door, in the glow of a student lamp which he had set on the table inside. "It makes it look like a home," he said to himself—"and if anybody passes by—why, there's some one now!"

He gazed eagerly at the dark figures entering the gate leading from the side road, and before he could do more than rise, Ran and his party were upon him.

To say that Sam was bewildered would be putting it mildly.

"Here's a tenant for our house," Ran called out cheerfully, giving Sam a dig in the ribs.

"Yes, yes," stammered the other boy.

"Mr. and Mrs. Douglas and their baby are going to move in. Lift out that little oil stove, Sam. We'll get another lamp presently, Mrs. Douglas; we have several up at the house." He bustled about, showing the various contrivances to the somewhat dazed young couple, and giving Sam a vigorous shake of the head from time to time, to indicate to him that he must await explanations.

But after doing all that was possible to help the new tenants to settle, Sam even doing a bit of marketing for Mrs. Douglas at the nearest store, the two lads tore themselves away, promising to run back after supper with the extra lamp.

"Here!" Sam stopped abruptly when they were out of earshot—"tell me what it means."

Ran stammered out his story. "Why, that Jessie Mallard," he wound up, "was the prettiest girl I ever saw. All the big boys were crazy about her, and her uncle was, too. I heard she had stuck to marrying her soldier chap, though Major Mallard was sore about it and didn't want her to."

"Yes, but what kind of tenants will they make?" demanded Sam impatiently. "They don't look as if they had a cent in the world."

The supper bell tinkled on the back porch, but Ran stood stock still. "I know—Sam, it's hard on you, all right. But I couldn't let them turn her out in the street. I don't care if I never get to Moosehead Camp till I'm ninety."

Sam whistled—"Oh—I see! You mean to let them stay here for nothing." A tense pause. "How about dad and his \$25?"

Ran began to move toward hot rolls and chops. "I figure he can pay a little something. She never got that house over the tracks for nothing, not from those fellows. We'll take what they can spare, so that dad won't be out anything, but until they get better fixed than they are now, I wouldn't any more touch their little bit of money than—than—"

"Snatch the bottle away from the

At Tomato Time The Auto-Wheel Coaster

Another time when the Auto-Wheel Coaster is especially useful, it's a big roomy wagon and will haul two bushels of tomatoes in one load. The

Auto-Wheel Coaster

is strong. It travels over rough roads and bumpy fields without danger. It lasts for years under the hardest kind of usage. The roller-bearings make the hauling easy. You'll hardly know you have such a heavy load.

The Auto-Wheel Coaster helps in the other farm duties. It speeds up the work and gives you more time for play.

Prize Contests

The "Auto-Wheel Spokesman" is a publication for boys and girls, telling all about the Auto-Wheel and the prize contests we hold periodically. Full of interesting topics. We'll give you a FREE six month's subscription to the "Auto-Wheel Spokesman" if you'll send us the names of three coaster dealers, telling us which ones sell the coaster wagon with the name Auto-Wheel on sides.

baby!" finished Sam. "You've got to tell dad, though."
(Continued next week.)

HOUSEHOLD QUERIES

Pickling Ripe Olives

Will you please tell me how to put up ripe olives in open jars? Should the last brine be changed after the olives have been in it some time? Would that keep them from getting soft?—Subscriber, Tracy.

Where oaken barrels or jars are used, be very sure that they are absolutely clean. Mrs. Sherman of Fresno gave to the Cultivator years ago directions for pickling olives that can hardly be bettered, and she recommended that barrels be cut in half, filled with lime and water until needed. Then into 12½ gallons of water put 1½ pounds of lye and two pounds salt, filling barrels three-fourths full. Put freshly picked ripe and sound olives into this solution. After 12 hours test olives by cutting through. If yellow stain from lye reaches almost to pit, run off lye and put on fresh water, adding 1½ pounds salt. The water should cover the olives three or four inches. Stir with wooden stick every two or three hours. Change brine every other day. After two days taste, and if bitterness is all out, repeat lye. The use of the salt keeps the olives from getting soft and in a measure sets the color. Let light into the olives when in the brine, but avoid direct sun rays. This also helps to blacken the olives. If olives pucker in the brine, simply run off brine and cover with fresh water for a couple of hours until plumped out again, then put on weaker brine. The olives will keep a reasonable length of time in open vessels if brine is watched and boiled often enough to keep down bacteria. It is better to can them in glass or tin while perfect.

Canning Pimentos and Peppers

Please tell me how to put up ripe pimentos. Can green ones be put up so as to keep green color? Will any sweet pepper do as well as pimentos? I also want to know how the women of Washington state make olive cherries. The Cultivator is a welcome visitor in our home. I have received many useful things from it.—Subscriber, Tracy.

Take fresh, fully ripened pimentos, cut off stem end, take out seeds and stringy portion. Place in cloth bag, immerse in boiling water five minutes to blanch, then plunge immediately into cold water. Pack in small jars, for they spoil quickly when opened and are so rich that one does not use a large quantity at a time. Fill jars with boiling water and sterilize one hour for three successive days or five hours continuous boiling. If preferred use boiling brine of three level table-spoons salt to one gallon water. Add small jelly glass full of lemon juice or vinegar if wished. The green peppers may be put up in same way. The blanching and dipping into cold water helps to keep green color.

Olive cherries we pass up. Can anybody help us out? The Cultivator will gladly pay in subscription credit for such hints published.

Sugar Cucumbers

Here is a recipe for sweet pickles sent in answer to request last week. Clean ripe yellow cucumbers and cut in squares. Boil in weak vinegar until nearly done, then drain. Make a syrup of 2 cups vinegar, 4 cups sugar, 1 tablespoon cinnamon, 1 teaspoon cloves, ½ teaspoon ginger, ½ teaspoon mace, ½ teaspoon alum. Put cucumbers in jars, cook syrup till thick and pour over cucumbers; seal.—Mrs. W. K. Anaheim.

MRS. WILSON'S COOK BOOK

"Mrs. Wilson's Cook Book, by Mrs. Mary A. Wilson. Published by J. B. Lippincott Company, Philadelphia and London. \$2.50 net.

Any cook book is interesting to a housekeeper, but this one is more than that. On looking over its pages you feel that you have been visiting with a practical, whole souled woman who knows herself exactly how to do things and finds her chief pleasure in giving you the full benefit of her knowledge and experience.

"Gone are the days of plenty when the extravagant cook was the best cook. Banish all recipes that call for cups of butter," says Mrs. Wilson in her talk on "Measurements." "You know it only takes a few minutes longer to measure accurately, and then you are able to make that delicious cake without a failure. No failures, no waste. Truly the words, 'trusting to luck,' should be taboo in the efficient woman's kitchen." And she proceeds to give all sorts of practical hints for saving food supplies.

The book opens with clear and very detailed directions for making good bread, good bread of many kinds, all handled in a simple and convincing way that would encourage the untried housekeeper to follow them and give to her family the real thing in the way of the staff of life. Mrs. Wilson tells what kinds of flour to use, utensils necessary, proper temperatures, method of kneading, different handling in summer or winter, and many other practical details. Eight pages are given to these general directions before any specific recipes are given, all eight packed full of practical helps.

The recipes are exceedingly up to date, many being given that were learned from French cooks during the great war. Nor are the good old Southern and New England standbys neglected. Then the book has many recipes for special California foods, California Orange Bread, for instance,

Orange Mincemeat and Lima Bean Croquettes. Then there is Sweet Potato Pone, Bengal Curry of Lamb, Gloucester Cod a la King, Ye Old Tyme Oyster Pie, Italian Polenta, Lancaster County Dried Corn, Chinese Chop Suey, menus (with recipes) for winter days, for summer days, for wedding suppers, country suppers, many other special occasions.

But we can't even give a hint at all the interesting things packed between the covers of this book—the inside covers, by the way, are printed with tables of measures, cooking calendars, proportions, etc., the easiest possible location for quick reference.

A final word as to the author. She is now at the head of Mrs. Wilson's Cooking School in Philadelphia, and the publishers add this. "Mrs. Wilson literally 'cooked to the queen's taste' as she served five years at Buckingham Palace in the service of Queen Victoria. She also served as chef in many of the famous resorts and cities in Europe."—R. P. D.

EXPLAINED

"Please hurry," said the wife impatiently to her husband. "Have you never buttoned a dress behind before?"

"No," replied her husband, also impatiently. "You never had a dress that buttoned before behind."

RHUBARB---Wagner's Giant Plant Now August is a Good Month to Plant

Growers who planted last July and August have already harvested over 15 tons per acre netting \$1000 eleven months from planting. For further information, write J. B. Wagner, Rhubarb Specialist, 1550 East Villa St., Pasadena, Cal.

The Power of the Hour

MECHANICAL power is stepping swiftly into the breach that has been formed by restless, dissatisfied labor. This is true in the city and it is true on the farm.

Today Titan 10-20 Tractors are the labor-saving power of the hour on the farms of America. Everywhere, reaching to the farthestmost boundaries of agriculture, you will hear the steady chug-chug of these tireless toilers. They are displacing men and horses and getting more work per day from available farm labor. Soon summer fallowing will be under way in many sections of

the country, and there you will find Titan 10-20 Kerosene Tractors working faithfully from sun-up to sun-down, undisturbed by heat or flies, turning the hard-baked ground in the interests of bumper crops.

New Titans are scarce just now, due to the unprecedented demand, but perhaps your nearby International dealer is so fortunate as to have one or two still available. This will result in good fortune for you—if you act at once. Titan and the International dealer are good to know in a time like the present.

Milo: No. 3, carlots, 2.50.

Wheat: Mixed feed, Utah-Idaho, 56.50.

HAY

Alfalfa Growers of California report under date of August 1, 1920:

The upward tendency of the market for alfalfa hay, as far as can be judged by the Alfalfa Growers of California, the amounts of hay bought by dealers for winter storage and by dairymen for their season's requirements average on the whole lighter than usual at this time of the year.

In anticipation of a probable shortage of baling wire, the association some time ago bought as much of it as it could afford in excess of the orders then placed with it by members. When the shortage did develop we were therefore still able to supply our members, but now our surplus stock is completely exhausted. We will promptly notify you when we are able to obtain a supply again, but the prospect is not encouraging at present.

As a result of this shortage, baling outfits have already been laid off in some localities and it looks as if others will have to follow suit, as there is no relief in sight for an indefinite time, according to the representatives of the eastern wire mills. There were approximately 1,500 tons of hay of all kinds received on the tracks week ending July 31, 350 tons left over as against 2,000 tons received on the tracks week ending July 24.

Leghorns, 22@24; large, 35@36; roosters, young, 45@50; old, 18@20; broilers, 34@38; fryers, 33@40; turkeys, 37@40.

Ducks: Indian Runner, 21@23; Pekin, 21@23. Squabs, 55@60; pigeons, doz., 2.35@2.50.

Belgian hares, live, 17@20; Jack rabbits, dozen, 1.50@3.50.

LIVESTOCK

Western Meat Company prices are:

Cattle: Grass steers, No. 1, weighing 1,000 to 1,200 lbs., 9½@10; do, 1,200 to 1,400 lbs., 9@9½; do, second quality, 7@8; thin, 6@7. Bulls and stags: Good, 4@5; fair, 3@3½.

Cows and heifers: No. 1, 8@8½; second quality, 6@7; common to thin, 2@4.

Calves: Lightweight, 10½@11½; medium, 9@10; heavy, 10@10½.

Lambs: Milk, 8½@9; yearlings, 8@9.

Sheep: Wethers, 7@7½; ewes, 5½@6.

Hogs: Weighing 100 to 150 lbs., 16; 150 to 225 lbs., 16½; 225 to 300 lbs., 16; 300 to 400 lbs., 15.

bulls, 4½@5.

Virden Packing Company quotes prices on livestock, weighed and delivered out cars at its plant, South San Francisco, as follows:

Cattle: Good steers, 1,000 to 1,100 lbs., 10@10½; top steers, 1,100 to 1,200 lbs., 9@9½; top steers, 1,200 lbs. and over, market price; good cows and heifers, 8@8½; No. 2 cows and heifers, 6½@7; good ished, 100 to 150 lbs., 15½; 150 to 225 lbs., 16½; 225 to 300 lbs., 15½; over 300 lbs., 16½.

14%; under 100 lbs., 14%.
Calves: Light, 13@14.
Hogs: Top packer, hard and well finished, 100 to 150 lbs., 16; 150 to 225 lbs., 17; 225 to 300 lbs., 16; over 300 lbs., 14%; under 100 lbs., 14%.
Ewes: Full wool, 6½@7.
Wethers: Full wool, 7½@8.
Yearlings: 9@9½.
Milk Lambs: 10½@11.

POTATOES AND ONIONS
Potatoes: River, cwt., 3.00@4.00; fy., 4.25@4.50; Sweet, No. 1, 15@20.
Onions: New reds, 75@1.00; yellows, 1.00@1.50 cr.; green onions, 1.25@1.50.
Garlic, new, 10@12½.

VEGETABLES
Wholesale selling price:
Beans: Lb., String, 3@6; Wax, 2@5.
Cucumbers: Bay, 75@1.25.
Corn: Sack, 2.50@3.50.
Eggplant: Livingston, 1.50@1.75.
Okra: bx, 1.00@1.25.
Peppers: Bells, lug, 50@75; Chili, lug, 50@75.

Squash, Summer: Lug, 50@60.
Tomatoes: No. 1, 1.50@2.25; No. 2, 60@80.

FRESH FRUITS
Apples: Red Astrachan, 1.50@2.00 for 4-tier; 1.00@1.25 for 4½-tier; unwrapped, 75@1.00; Gravenstein, unwrapped, 1.75@2.00; wrapped, 4-tier, 2.75@3.00; crab, 1.25@2.00; Red June, 3.00@6.00.
Apricots: Imperial Valley, Los Angeles lugs, 4@8 per lb.
Bananas: lb., 8@10.
Berries: Strawberries, large, 90@1.10; small, 65@90. Loganberries, red, 50@65 per drawer. Raspberries, red, 50@65 per drawer. Blackberries, 50@65 per drawer.
Cherries: Black, lb., 10@18, according to quality; Royal Anne, lb., 10@18.
Cantaloupes and Melons: Turlock ponies, 2.50@3.25; standard, 3.75@4.00; flats, 1.25@1.50 per box; Honey Dew, per crate, 1.00@1.50; casabas, nominal. Watermelons, Imperial Valley, 2½@3.
Plgs: 1.00@1.50 for white and Brunswick per box of one layer; two layer, 2.25.
Grapes: Malaga, 3.00@3.25 per crate; Dletties, 4.00@4.50; Seedless, 3.00@3.50.
Nectarines: Cr., 2.00@2.25; basket, 1.50@2.00.
Peaches: Boxes, 1.25@1.50.
Pears: Madeline or Dearborn, lugs, 2.00@2.50; small, 1.00@1.25; Bartlett, No. 1, 3.00@3.50; No. 2, 1.00@1.75.
Pineapples: Doz., 3.00@4.25.
Plums: Tragedy, 1.50@1.75 per crate; Santa Rosa, 2.00@2.25; Climax, 1.25@1.50; Burbank, 1.25@1.50.

CITRUS
Box: Lemons, standards, 2.00@5.00; lemonettes, 1.50@2.50; grapefruit, 2.75@4.00; Navel oranges, 5.00@6.50.
BEANS AND PEAS
California Bean Growers' Association, San Francisco, August 2:
At the present writing it is very difficult to state just what the market is, as some of the dealers are quoting ridiculously low, endeavoring to move some of their stock on which they are obliged to liquidate. The offerings for shipment are about as follows:
Pinks 6.40@ 6.65
Large Whites 6.00@ 6.25
Small Whites 5.75@ 5.90
Blackeyes 8.00@ 8.25
Bayos 10.00@10.50
Mexican Reds 8.00@ 8.50
Red Kidneys 14.50@15.00
Cranberries 7.00@ 7.25

HOPS
1919 crop, 85@1.00 per lb. Prices to growers for 1920 crop, 65@80 per lb.
GRAIN
Wheat: 3.75@3.85.
Oats: Red feed, 2.60@2.70.
Corn: California Yellow, 3.40@3.50 per cental; California milo malze, 3.40@3.50.
Barley: No. 1 feed, 2.40@2.45.

HAY
Alfalfa Growers of California under date of August 1:
Most of the dealers and consumers are still only buying for current consumption but otherwise are as yet holding off. Some sales by outside growers in this district, where our membership is still comparatively small, were made this week at several dollars below the prices obtained by the association up to that time for all the hay our member growers had listed.
No. 1 Dairy Alfalfa.....32.00
Standard Dairy29.00
Stock Hay27.00
Under date of July 30, A. W. Scott Co. says:
Receipts past week 3,568 tons. General trade extremely light and very little transfers of hay are reported in any of the larger producing centers.
We quote today wholesale prices in carload lots (old crop) as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers charges of cartage, commission and handling expenses must be added according to conditions.)
Wheat hay, fancy.....28.00@30.00
Wheat hay (light 5 wire bales) 26.00@28.00
Tame Oat hay26.00@28.00
Wild Oat hay20.00@22.00
Barley hay20.00@23.00
Alfalfa hay first cutting20.00@25.00
Alfalfa hay second cutting.....24.00@28.00
Alfalfa Growers of California quote prices for Northern Districts:

Standard dairy32.00
Stock hay28.00

Citrus Markets
Los Angeles, August 4, 1920.
Valencias are still in strong demand. It is estimated that not more than 4,000 cars remain in California for shipment. F. o. b. quotations are ranging between five and six dollars; nine dollar prices for extra fine stock in auction markets not uncommon.
The lemon market is slightly better. The weather has been warmer and foreign has dropped slightly, there being at this time only about 155,000 boxes due to arrive within 30 days.

Shipments
Shipments to date from Southern California since Nov. 1, 1919: Oranges, 20,237 cars; lemons, 6,671; total, 32,908. To same date last season: Oranges, 29,338; lemons, 8,417; total, 37,755. From Central California to date this season: Oranges, 5,375; lemons, 288; total, 5,663. To same date last season: Oranges, 3,714; lemons, 251; total, 3,965. Northern California this season: Oranges, 261; lemons, 23; total, 284. To same date last season: Oranges, 244; lemons, 2, total, 246.

AT THE AUCTIONS
July 27
New York: 16 or., 3 mixed. Val. 2.80-7.80, grapefruit 1.70-5.70.
Boston: 6 or., 6 lem. Val. 4.05-7.05, grapefruit 3.05-3.40, lem. 90-1.85.
Pittsburg: 4 or., 2 lem. Val. 2.65-7.20, lem. 1.50-2.75.
July 28
New York: 15 or., 3 grapefruit, 3 mixed, 1 lem. Val. 3.75@9.00, grapefruit 2.50@5.05, lem. 1.10@2.00.
Boston: 9 or., 6 lem. Val. 3.85-6.50, lem. 55-1.90.
Philadelphia: 4 or., 4 lem. Val. 2.75-7.25, lem. 75-2.60.
St. Louis: 2 or., 1 lem. Val. 4.60-5.85, lem. 2.05.
August 3
New York: 16 or., 1 grapefruit, 3 mixed. Val. 3.40-9.25, grapefruit 2.60-5.05, lem. 4.15.
Boston: 7 or. and grapefruit. Val. 4.56-6.35, grapefruit 2.80-3.70.

ATTENTION

KILLEFER EFFICIENCY

Beet growers should anticipate their wants in Beet harvesting tools and repairs for same, as much as possible, this year.

The steel mills are not able to supply the usual quantities of high grade steel used in the manufacture of our beet tools and repair parts. We have on hand a limited number of Two Row and Four Row Automatic Lifting Beet Plows for tractors and the Single Row Riding Plows for teams. We also carry a stock of extra Shares, Shins and Points. If your dealer does not stock these extra parts, write us and we can fill your order by express, freight or parcel post. Write for catalog No. 2.

More Profits with Silage- Use a Fordson Tractor and a Little Giant Belt

Not only does the making of ensilage furnish a supply of exceptionally good, economical feed for live stock but it clears the corn field for an early start the next season. It's another step toward more efficient, more profitable farming.

And when you belt your Fordson to your ensilage cutter, be sure it's a Little Giant tractor belt that transmits the power. Little Giant belts are specially designed for exclusive use with the Fordson and combine the features that enable the tractor to develop a steady, even flow of unfailing power through its belt pulley.

The Little Giant grips the pulley like the clutch of a giant hand. There is no slippage and wastage of power even when the ensilage cutter is overloaded. The Little Giant is an endless belt so there is no pulling out of belt ends and no delays for relacing. The Little Giant is a special treated, canvas belt and is unaffected by the moisture, heat and exposure a belt must meet in farm work. An exclusive feature is the extra stitching which resists the effects of edge wear and greatly lengthens the life of the belt.

You can buy a Little Giant from your local Fordson dealer—save the expense and delay of sending away for a belt. Ask your Fordson dealer to show you a Little Giant belt, or write us direct for complete information.

It Made Good With a Punch on the World's Worst Roads

Unusual conditions forced a group of wealthy oil men to build a car for their own needs, one that would withstand the world's worst roads—the oil field roads of the mid-continent oil fields. They called it the TULSA, after the city that is the hub of their activities.

These men knew from experience what they needed in a car to stand the terrific punishment inflicted on a car in the oil fields. They secured one of America's foremost automotive engineers, who built the TULSA under their direction.

For more than two years the TULSA has been subjected to the most gruelling road tests. Day in and day out, it went down into the very depths of mud, mire, gumbo, ruts and sand—over roads utterly impossible to describe. Minor shortcomings were immediately remedied, until today the TULSA is known to be right.

The public was quick to find out about the unusual performance of the TULSA, and asked for the privilege of using this car of astounding achievements. So what was the outgrowth of these oil men's needs now becomes a gift to others in the TULSA Touring and Roadster models.

For the Smooth California Boulevards, The TULSA Has Absolutely No Fear

With such a remarkable performance record in the rugged oil fields, certainly the TULSA can be relied on for any service you might desire over the beautiful California roads.

Its lightness combined with its durability not only means extra mileage on tires and fuel, but a big saving in general upkeep and repairs. It also assures the driver of perfect ease in operation and control.

Repeated road tests show an average of 18 miles per gallon on gasoline—8,000 to 10,000 miles on tires—450 miles per gallon on oil. With the increasing cost of tires and fuel shortage, these are important items to consider.

The Touring and Roadster models are built on the same chassis as the famous Oil Field Special—the only difference is found in their smart lines, appointments, and unusual riding comfort.

Practical Instruction in Citriculture

AFTER a lapse of three years during the war, the division of citriculture of the University of California again conducted its summer traveling course. The purpose of this traveling course is to give the students an opportunity to study the practical side of agriculture by getting on the ranch, making observation and talking with the actual growers. Most of the time is devoted to citrus and semi-tropical fruits, but other phases of agriculture are not neglected. Ranches of all types are visited and notable failures, as well as successes, are pointed out. Such other factors as land values, labor conditions, water supply, soil types, etc., are also studied. The great value of this training is that with such knowledge of the agricultural possibilities of the state the student leaving the university is better fitted to take advantage of the opportunities offered whatever line he may follow. The class this year numbered 17, five women and 12 men. They covered 2,300 miles by automobiles, beginning at Berkeley May 6 and ending in Pasadena June 16. The route led from Berkeley into the Sacramento Valley, up the east side and down the west side, through the San Joaquin and over the Tehachapi into Ventura, Los Angeles, Orange, Riverside and San Bernar-

In the Cultivator of June 26 we gave illustrations and merest reference to the trip or traveling school participated in by a score of members of the citriculture class of the University of California. This class had been under instruction of Dr. J. E. Coit and his assistant J. C. Johnston, and the practical or final step in the instruction was made possible through the arrangement of an automobile trip covering some 2,000 miles. These trips were begun nearly a dozen years ago but during the war were discontinued. The Cultivator camera was brought to bear on the class in one of Southern California's orchards and the members were requested to give to Cultivator readers their impressions, or rather to answer this question, "What is the one biggest lesson learned during this trip?" Most of the members of the class have responded and their answers are given below, the first, or introductory, paragraph being given by Mr. Johnston.

dino Counties, including a most interesting trip into the Coachella Valley.

The trip this year was a very successful one, due chiefly to the hearty cooperation of the growers with whom we came in contact, and I want to take this opportunity to express the sincere appreciation of the class and of those connected with the class.

Edith H. Phillips, Berkeley

The accompanying photograph shows what made the greatest impression, what taught me the biggest lesson of our whole trip, and that is that employers are taking more interest in the living conditions of their employees than ever before. This picture shows some very substantial and extremely attractive houses for employees that are under construction at the Limoneira Ranch near Santa Paula. The owners are not stopping with the houses, but are planting lawns and flowers. This was not the only place where there was similar activity, but because it was the first, it made the greatest impression.

John D. Lyons, Altadena

It was interesting as we went over the state to see the different methods of pruning the same tree under like conditions. There are more distinct methods of pruning the olive, for instance, than you can count on one hand and many are widely different, even in principle. It might be thought that from such a trip as ours we

always cover crops. That, personally, is the most poignant lesson of the 1920 summer traveling course in citriculture. As a student and a grower, I went on "Citriculture 91" with several problems in mind. One was the advisability of the continuation of the practice of cover cropping. Not necessarily was it the orchards that had had cover crops that pointed out the lesson. We saw groves in which cultivation was getting more difficult as the years progressed. On the other hand, we saw groves which not so many years previous had been in an almost unworkable condition, brought to an almost ideal tieth. The owners did not claim that cover crops alone were responsible for the victory, but

The Woman Thinks First of Comfort for the Human

This gives Miss Phillips' idea of the most important lesson of the trip through the orchards of California. Employees' houses at Limoneira Ranch, showing how provision for the comfort of the employee and his family makes for greater contentment and more efficient labor.

might be able to say that a certain method was the best, but the equality of the results is surprising. One man's trees do not look like his neighbor's, but they each get a crop, and while each method seems to have its advantages, it is practically impossible to say that one is better than the other. All deciduous seem to be much the same, but one method seems to be a little better, at least with young trees.

With citrus it is quite different, as there seem to be one or two similar systems that make a much better tree than the others, at least from the production standpoint, and a great many that we do not approve of.

Barbara Adele Engelhardt, Lindsay

Cover crops, more cover crops, and

they were given the major portion of the credit. Not depreciating the immense value of barnyard manure and commercial fertilizers of the bone meal and tankage type, I feel confident that a cover crop, properly handled, will benefit practically any orchard.

Marjorie Melvin, Oakland

The spirit of cooperation and the great extent to which the average farmer applies scientific knowledge are to me the outstanding cultural lessons of our trip. Everywhere we went, from one end of the state to the other the farmers had a spirit of

(Continued on Page 183.)

Class Day in the Field

Citriculture class of the University of California in the R. M. Teague citrus nurseries. This is the entire class which made the trip excepting Lal Singh of India. The three gentlemen at the extreme left of the picture and the fourth from the right were not members of the class. The names of those in the picture from left to right are: Lieutenant James Stewart of the R. M. Teague Nurseries, San Dimas, formerly ordnance lieutenant with overseas forces; Captain C. H. F. Woolley, Cape Province, South Africa; R. M. Teague, San Dimas; J. C. Johnston, Berkeley; Wesley Flemming, Orange Cove; Edith H. Phillips, Berkeley; Mrs. Fredrick Ellcott, Chester, England; Raymond Giston, Orange; Mrs. J. C. Johnston; R. M. Hale, Placentia; Marjorie Melvin, Oakland; Edgar Boal, National City; H. R. Schlapp, Australia; Barbara Adele Engelhardt, Oakland; John H. Irish, Berkeley; J. D. Lyon, Altadena; W. L. Johnson, Lindsay; W. T. Preston, San Dimas; W. H. Wright, Glendora; E. G. Schlapp, Australia; Robert Justa, Argentine.

A big-scale road test on 3,200 tubes

How Firestone puts the miles in—and then proves it—not at YOUR expense

No other tubes in the world are road tested on so big a scale as Firestones. The Yellow Cab Company of Chicago uses Firestone Tubes exclusively on its 800 taxicabs. The service of these tubes is checked constantly—improvements and developments are arrived at.

By close watching of a large number of tubes in service—not confined to isolated instances—the conclusions are accurate and definite.

Firestone puts the best in materials into tubes by establishing purchasing experts at Singapore, center of the world's rubber market. Firestone puts the best in workmanship into tubes by organizing the crack

manufacturing organization of the industry on a profit-sharing basis.

And then subjects the finished product to this big-scale road test—in order to get you more for your tube money and most miles out of your tires.

Firestone Tubes resist heat—which everyone knows is the tubes' worst enemy. Their laminated construction, ply on ply of thin rubber sheets laid crosswise and perfectly vulcanized, gives the stoutest tube wall. Their larger sectional size means less stretch to fill the casing. Ask your dealer for Firestone Tubes. They cost no more than the ordinary kind.

One Dollar Yearly

All Ready for a Better State Fair

PRELIMINARY reports from the office of Chas. W. Paine, secretary California state fair, indicate that the 1920 show will mark a new step in the agricultural development of this state. Saying each year that the current show will be larger than in any former year has long since lost its significance. It is to be expected that the state fair in any rapidly developing state, particularly California, will register increased entries each year. But to say that the forthcoming fair

will be "better" than any former fair can be taken to mean much. A successful fair is not measured by mere bigness; rather is it measured by the degree to which it represents the resources of the community it seeks to serve, and in the manner in which those resources are presented in order to serve to educate and inspire fair visitors to adopt more efficient methods. The directors of the California state fair seem to have caught the correct conception of what a state fair should be. At least there has

been a marked improvement during the past few years and the approaching fair will incorporate many new departures, all directed toward public education. Of course, the usual amusement features will be given a large place, for it has been demonstrated many times that the public wants entertainment along with instruction.

Last week Secretary Paine was asked what would be the big outstanding feature and he replied: "There will not be any. You see, this year we are attempting to make every de-

partment as strong as possible and I judge we have succeeded pretty well when I can't honestly point to any one feature as being outstanding. I believe the 1920 fair is by all odds the best balanced show we have ever staged." The word "balance" seems to express the idea. There is evidence of balance throughout the various departments.

A striking feature will consist of the county exhibits. The directors have made a special effort to induce

(Continued on Page 198.)

Raisin Company Still Doing Business

A FEW years ago raisins were selling at a cent, or possibly two cents, per pound. That is, they were occasionally and occasionally they were being made into hog feed. Many a raisin grower can certify to having eaten exceptionally fine raisin fed pork. The federal government had no concern in the prices which were then prevailing nor the disaster nor tragedy which it meant for many California homes.

The existence of the raisin industry became precarious. From a food production standpoint there was little concern as to perpetuation of the business, but self preservation demanded a getting together of the raisin producers, and self preservation or absolute necessity seems to be an essential in the organizing of a cooperative marketing association. In this case the incentive was sufficient and in their desperation, even when confronted with the fact that failure had been the result of former efforts, the growers finally agreed to hang together. They hung.

It is a long story and familiar to all. The success created a situation which called for federal action. At least, it called for it in the mind of Attorney General Palmer, who appealed to the federal trade commission to investigate this organization which had saved the homes of its members. The commission investigated. Raisin growers and officials of the association were called to Washington. This was months ago, and the investigation has been almost continuous. At least, the racking strain on the nerves of those who are responsible for the success of the association has been continuous. Thousands of pages of manuscript have been required to contain the evidence and the findings of the commission.

The final report has now been made. At first reading the producers were dumbfounded, for it appeared that the ruling practically read the organization out of existence. More careful reading has resulted in a far more hopeful attitude. Wiley M. Giffen, president and manager, and Attorney Sunderland, who handled the defense of the company in Washington, both make hopeful reports. Mr. Giffen's statement was made before the full text of the commission's report was received. He says, however, that most careful reading of the report in

no way materially changes his first conclusions. Here is Mr. Giffen's report:

By Wiley M. Giffen

The statement in daily papers to the effect that the federal trade commission had found the Associated Raisin Company guilty of violating the anti-trust laws has cast a gloom over the community that we believe is out of all proportion to the actual findings in the case. It is true that a superficial reading of the report listens badly, but on a careful reading it becomes evident that it is not really very serious. It was our intention to make no further statement until we had received the full report, but the interest and anxiety are so great that we are now going to give you our interpretations of the findings based on the reports as obtained by the newspapers, with the understanding, of course, that this interpretation may have to be changed when the full report is at hand.

In a general way the recommendations consist of three groups. The first group the dispatches claim is but mild criticism of our practices, and is as follows:

1. The commission finds fault with the smallness of the differential between loose and seeded goods.
2. With our refusal to pack private brands.
3. With the length of the life of the contracts to purchase from the growers.
4. With the clause providing that these contracts run with the land.

We think these things are all of vital importance to the organization, and do not want to give them up, but as the commission expressly states, they have not found these acts to be unfair methods of competition, we take it for granted that the criticism, if any, was so slight that we do not need to consider it further.

The second group of recommendations is:

1. The elimination of capital stock and the substitution thereof, if necessary, of a non-profit sharing basis of providing financial resources.
2. The elimination of profit to the corporation or to its stockholders as profit on the operations of the corporation.
3. The restriction of membership or beneficial interest in the corpora-

tion to those whose interests are identical, that is, to actual growers of raisin grapes.

These recommendations are made to apply only in case we claim exemption from prosecution under the Clayton act, and, as we frankly stated to the commission, we did not claim this exemption, but consider ourselves amenable to the Sherman anti-trust law. This is still our position, making these recommendations entirely beside the point as far as the present consideration of the case is concerned. The Clayton act is an amendment to the Sherman anti-trust law, which holds immune from prosecutions labor organizations and farmers cooperative organizations without a capital stock, and while it is barely possible we could reorganize according to the suggestions made by the commission, so as to come within this exemption, we feel so confident that we are not at the present time violating the Sherman Anti-trust law that we prefer to take our chances under the law, so that we can also pass this group of recommendations without a serious consideration.

The third group of recommendations is those that, according to the commission, will bring us within the provisions of the Sherman Anti-trust law, and is as follows:

First: Cancellation of all contracts fixing selling price on the condition of exclusive dealing.

Second: Separation of plants purchased or leased from competitors so far as may be necessary to insure freedom of competition.

Third: That we refrain from buying raisins for cash.

Fourth: That we do not further curtail the production.

Fifth: Abandonment of the plan of selling firm at opening price.

Sixth: Abandonment of guaranteeing our price against our own decline.

Seventh: Annulment of the California Packing Corporation contract.

Eight: As an alternative plan—dissolution.

We are not quite clear as to the meaning of the first two of these recommendations, but feel that it must apply to the first year of our life, when we were working with a large number of packers and had leases on their houses and selling contracts. If this is the correct interpretation of these

clauses there can be no further complaint along this line, as we have long since ceased to have these leases and selling contracts.

The third recommendation that we cease buying for cash is also agreeable to us, as we have not bought a single pound of raisins under this plan since the second year we were in business. We not only considered it a probable violation of the law, but a very bad policy to be doing both a paternal and commercial business under the same roof.

The fourth recommendation that we discontinue curtailing the production is also agreeable to us, and as a matter of fact was never practiced to any extent. It is true that the first and second years we distilled a lot of poor raisins and paid the growers bonuses for putting their second crop and Feherzagoes into the wineries instead of making raisins of them. At that time we were struggling for our very existence, but have now found a better way and are advertising the surplus into consumption, also a recommendation that was complied with five years before it was made.

The fifth recommendation we have already complied with as we had notified the trade by circular letter two months ago that we would not again sell firm at opening price.

The sixth recommendation, against the guaranteeing of our own price, we have no objection to, as we stated to the commission during the hearing that we would not make this guarantee if in their judgment it was objectionable.

The seventh recommendation, which is the annulment of the California Packing Corporation contract, is the only difficult one. As we have before stated, we do not believe at this time that this contract is of value to us and would, if we were only considering ourselves, be very glad to comply with the recommendations of the commission, but this contract was entered into in good faith at a time when we believed we were in need of the help of the California Packing Corporation in the marketing of the crop, and we do not feel now that we have grown stronger and do not longer need their help that we have a right to take advantage of the present situation in an attempt to set aside this

(Continued on Page 182.)

Agricultural News Notes of the Pacific Coast

Northern California

Chico and Oroville in Butte County are talking county division.

Wage scale of Sacramento Valley canneries, \$4.60 per eight hour day.

Corning fruit drying yards are busy with nearly 100 cutters on the peach trays.

California is now shipping close up to 1,000 cars fresh deciduous fruits weekly.

Petaluma farm bureau is planning an egg laying contest to start on November 1.

Eden Township, Alameda County, Farm Products Show begins on Thursday of this week.

San Francisco potato prices took serious slump and best grade stock now rarely reaches \$3.

Director Hecke announces fifty-third Convention of Fruit Growers will be held November 9-11.

Sacramento County farm bureau will have charge of Farm Bureau Day at the state fair September 11.

Junior agricultural clubs of Eldorado County are discussing holding an agricultural fair October 13-16.

Glenn County farm bureau is maintaining well equipped lumber yards at Willows, Orland and other centers.

Sonoma County fair announces it will have Friar Rock, a "quarter million dollar Sonoma horse," on exhibit.

Eldorado County farm bureau recently made an all day trip to various ranches in the county having pure bred stock.

Mendocino County farm bureau recently made shipment of eight cars of livestock, one of hogs, two of cattle and five of sheep.

Petaluma is planning for Egg Day, August 21. That district has over \$21,000,000 invested in poultry and produces over 700,000,000 eggs annually.

Colusa County, in conjunction with the state board of forestry, is taking precautions against grain field fires in the Williams and Maxwell sections.

Four thousand Alameda County farmers are expected to attend the Concord farm center barbecue and picnic September 11 in Mitchell Canyon.

Glenn County Swine Growers Association has united with Tehama, Butte and Colusa in the organization of an intercounty swine growers association.

State Leader Crocheron has called a meeting of farm advisers at Berkeley October 18-21, to be followed by Council of Agriculture, October 22.

Sonoma County farm bureau has an active poultry department which has outlined program for many of the meetings to be held during the coming year.

Tehama County farm bureau meetings: Corning, 19; Los Molinos, 23; Liberal, 26; Manton, 27; Bowman, 28; directors' meeting, Red Bluff, 21 at 10:30.

Many of the rice fields give promise of exceptionally early harvest. The early Onsen is heading and water is already being reduced on this particular variety.

Sacramento Valley and the Bay counties which supply fresh milk to San Francisco are greatly reducing the number of dairies, and the city is now receiving some 5,000 gallons less than is usual at this period.

Central California

San Joaquin cotton crop showing excellent condition.

Fresno has shipped its first straight car of Zante currants.

Tulare County's Livestock and Agricultural Show begins today.

Tulare cannery is appealing for more fruit cutters and peelers.

Fresno reports drying peaches as ripening rather later than usual.

Fresno's first car of Thompson Seedless sold at \$4.40 per crate.

Trouble is brewing between Japanese and white laborers in Monterey fish canneries.

Watermelons at Turlock have been selling around \$40 per ton, one day's sales averaging \$43.

It is estimated that California Peach Growers Inc. will handle about 33,000 tons of peaches this year.

The Associated Raisin Company will not fix opening prices this season, but will auction its first grapes.

Fig growers have united with the Peach Growers Association and it is hoped better marketing will result.

Salinas recently observed its Big Week with the usual rodeo roundup and meeting of California cattlemen.

Members of the Stanislaus Pure Bred Pig Club are starting off with enthusiasm in a new pig club contest.

Wine grapes have sold as high as \$100 a ton at Lodi. These same grapes a few years ago commanded only \$5 a ton.

The Kern County chamber of commerce is planning on making a special feature of Kern County cotton at the state fair.

Producers of all crops not perishable are cooperating in every way possible to prevent car shortage causing severe losses.

Prices on prunes, raisins and peaches are expected to be named by the big cooperative associations soon after August 1.

The Oakdale irrigation district is endeavoring to secure permission to issue \$2,000,000 worth of bonds for building reservoir.

The state water commission has revised its ruling which threatened to hold up the building of the Melones reservoir near Oakdale.

Will and Don Peters, members of the Boys Potato Club of Shafter, Kern County, harvested 8,455 pounds of potatoes from half an acre.

The Santa Cruz County farm bureau egg laying contest is hoping to make its influence state wide in the new contest soon to begin.

Fowler, Fresno County, is in the midst of its fruit shipping. Plums, grapes, peaches and Zante currants are among the heaviest shippers.

Kern County Thompson Seedless made up the first carload of grapes sent from the San Joaquin Valley to Chicago. This car left Bakersfield July 24.

Fresno growers of Malaga grapes have been much exercised over report that a carload of inferior grapes from another section was marketed in New York as coming from Fresno.

Cotton planters of Lindsay, Tulare County, have effected a temporary organization to cooperate in growing and marketing their crop. The growers hope to have a gin established in that section.

Southern California

Orange County has 86,000 acres under irrigation.

Ventura County reports biggest ever hay and grain crop.

Nearly all Southern California sugar mills are in operation.

The cannery at Banning is now running full handed on peaches.

Ventura County is moving for a county chamber of commerce.

Orange County reports serious infestation of perennial sow thistle.

Some cotton growers are trying topping of cotton to increase the yield.

El Centro, Imperial County, is organizing a cotton growers association.

Prospects are for a big crop of canning tomatoes in every tomato section.

La Habra citrus packing house employees recently enjoyed a dip in Balboa Bay.

Engineers are at work on surveys for canals under the all-American canal system.

Poultry culling demonstration at the place of L. G. Wiley, Van Nuys, on Sherman Way.

Oxnard sugar factory began slicing August 3. The first car of beets delivered was on July 28.

Gas may be had in quantities as desired, but five to ten cents has been added to price at many stations.

June was generally the coolest the southern part of the state has ever experienced and July the hottest.

It is hoped that a concrete bridge will soon be built over the Santa Ana between Riverside and East Riverside.

Imperial Valley is planting more generally to Pima cotton than any preceding year and finds results satisfactory.

The state school at San Luis Obispo recently lost 200 acres of grain hay because of fires started from locomotive sparks.

The mountains of eastern Ventura County are reported full of deer this season. The forest rangers are enforcing deer laws rigidly.

Riverside dairymen's cow testing association reports biggest production of butter fat by Holstein cow belonging to R. E. Babcock. Her record was 80.8 pounds.

Santa Paula, Ventura County, has five modern well equipped packing houses handling citrus fruits. There are also others handling dried fruits, walnuts, etc.

Navels promise to give one of the biggest crops ever this season. The June drop period has passed and growers feel assured no serious damage can now come.

Fallbrook, San Diego County, farm bureau center recently discussed soil handling and irrigation of citrus orchards, Prof. Valle of the experiment station making address.

Citrus growers of San Diego County will make a trip through Orange County orchards and packing houses under the direction of the San Diego County farm bureau this week.

Cotton growers have been called together by Director Hecke for discussion of cotton boll weevil and pink bollworm. Meeting to be held in Union League building, Los Angeles, August 20.

The Coast and General

New York is now shipping fresh peaches to Liverpool.

Skagit County fair at Burlington, Washington, August 9-14.

Virginia's first shipments of sweet potatoes are being made this week.

Colorado's pear crop will be larger than last year's by at least 500 cars.

Washington growers of cherries are receiving eight and ten cents a pound.

The Yakima Valley, Washington, wool clip aggregates 2,000,000 pounds.

Dates of the Spokane Interstate Fair and Livestock Show, September 6-11.

Oregon prune growers are selling the coming crop at 16 and 16½ for 30-35's.

Canneries at Bellingham, Washington, are now running 24 hours a day on raspberries.

The first cutting of hay in the Yakima Valley of Washington is selling at \$25 average price.

Lightning struck a hay barn near Litchfield, Arizona, last week, destroying \$44,000 worth of hay.

Mesilla Valley, New Mexico, shipped its first car of cantaloupes July 30. It will market this year 1,000 cars of pink meats.

Winlock, Washington, only a small town, reports having received a quarter of a million day old chicks from Petaluma during the past season.

The Arizona Cotton Growers Association held a meeting July 26 at Chandler to discuss the labor situation. A field meeting was held August 3.

Truck farms around Walla Walla, Washington, now show a planting of 900 acres in onions, 200 in rhubarb, 450 in potatoes, 100 in carrots, 200 in cabbage, 400 in asparagus and beets.

One of the experiment stations of the federal department of agriculture in Alaska is located only 75 miles from the Arctic Circle, where the yearly frost free period is about 97 days.

Arizona will not lift the quarantine against Texas cotton seed, as requested by the Texas authorities. The state horticultural commission considers the danger from the pink bollworm too great.

The French government has awarded 19 scholarships to students of American colleges and universities. The scholarships cover payment of all expenses for two years attendance at a French university.

The report of L. M. Harrison, field agent for the bureau of crop estimates in Arizona, states that the crop of cotton, July 25, was 85 per cent of normal. Last year the condition at this same time was 92 per cent of normal.

Representatives of the governor of Sonora, Mexico, have been in the Salt River Valley of Arizona recently to study housing and sanitation for Mexican laborers and to look into the possibilities of cotton growing as practiced in the Salt River Valley.

Some experiments conducted by a citizen of Arizona near Phoenix seem to indicate that the mulberry tree, known as the silk tree, will make a wonderful growth. Another pleasing feature of this discovery is that the tree will grow in soils not adapted for other crops.

A Successful Peach Sizing Machine

Designed by the Bureau of Markets, U. S. D. A.

THIS peach sizing machine consists of two parts, the sorting conveyor and the sizing section, the last named including the packing bins and the packing bench. In the illustration the sorting conveyor is shown at the left and consists of a padded hopper and an inclined roller conveyor. The roller conveyor consists of a series of wood rollers attached to link chains in such a way that an endless belt is formed which travels up the incline and as it does so the individual rollers, which are free to turn, are dragged over two leather covered board strips in such a way that each roller revolves slowly as the belt moves forward. The sorting conveyor communicates with the sizing section by means of a galvanized iron chute.

The sizing section consists of two sets of endless ropes which run in grooved guides made of wood elevated above the packing bins, a continuous sloping packing bin and a packing bench running around the entire sizing section.

Operation

The fruit is dumped on the padded hopper, which is 36 inches above the floor level and feeds automatically to the roller conveyor, one line of peaches moving into each space formed by the adjoining rollers, which are spaced one and one-eighth inches apart. As

the peaches are carried up the incline past the sorters, who are stationed along the sides of the conveyor, the peaches revolve slowly and evenly,

may be attached to the sides of the conveyor.

The peaches which are to be sized are delivered half to one pair of ropes

Peach Sizing Machine Invented and Dedicated to Public Use by U. S. Department of Agriculture

thus exposing their entire surface to view. The belt should travel between 15 and 18 feet a minute. Defective specimens not intended for packing should be removed by the sorters and placed in receptacles or chutes which

and half to the other pair by means of the divided inclined gravity iron chute. These ropes travel 120 feet a minute. For the first three feet they run parallel, then they diverge till they pass over the loose pulleys at the

opposite end of the sizer section. Both of the inside adjustable tracks (at the end of the parallel section) are weakened by a saw cut extending two-thirds of the way through the track. This point is reinforced by a strip of brass four inches long and one-sixteenth of an inch thick, which is screwed to the back of the track, thus furnishing a flexible joint which permits the track to diverge from this point. The tracks are adjustable and may be set at any desired width or altered to meet new conditions, while the machine is in operation. The peaches are carried along on the ropes until they reach a point where the space between the ropes is wide enough to permit them to drop through into the bin below. The largest size does not drop through but is carried into the end bin. Peaches of the same diameter will always fall at approximately the same point. It will be understood that the first section of the sizer in which the ropes are parallel serves to take out all of the small peaches (any minimum size may be selected) not intended for packing as a commercial grade. As the peaches fall through the space between the ropes they drop on a strip of stretched canvas and roll from there to the bins, from which they are packed into the shipping packages which rest on the packing bench.

Farmers Mutuals Make Rapid Growth

By Frank George

WHO does not recall the forest fire that swept the state of Minnesota in the fall of 1918, a conflagration that desolated acre upon acre of farm and forest property and exacted a toll of hundreds of human lives? The fire raged for days. It seemed as though the entire northern part of the state would be destroyed. But finally, through the heroic efforts of the fire fighters, the flames were got under control and the work of reconstruction was begun.

Everyone remembers the trail of bankrupt insurance companies that was left in the wake of the San Francisco earthquake. While the Minnesota calamity was small as compared to that devastation, its severity was proportionately as great. How, then, were the four or five farmers mutual fire insurance companies operating in the fire swept area affected? Although hundreds of thousands of dollars had to be paid out in insurance by these local companies, the other 155 farmers mutuals of the state came to their rescue and not one of the farmers companies in the path of the conflagration went to the wall. The typical farmers mutual is, of course, entirely exempt from the conflagration hazard. The farmers of Minnesota, however, refused to permit any mutual of the type in which they were interested to fail to meet its obligations, even when it happened to operate in a wooded area where a conflagration actually did occur.

Farm mutual insurance associations are cooperative enterprises. As a matter of self interest, if for no other reason, every member of the association is interested in seeing that fires do not occur, either in connection with his own property or that of his neighbor. That not only reduces the per-

capita cost of doing business, but produces a sound economic condition in any community.

There are now nearly 2,000 farmers mutual fire insurance companies in the United States with a total amount of insurance in force exceeding six billion dollars. Generally speaking these companies are enjoying a large measure of success. They are saving the farmers large sums of money each year by preventing fire losses and by reason of the relatively low cost at which it is possible for them to furnish insurance protection.

The first farmers mutual companies came into existence about 1825, in New England and the Middle Atlantic states. It was soon demonstrated that a considerable saving in the cost of fire insurance could be effected, and the movement spread to other communities. By the middle of the century a considerable number of farmers companies of this kind were in existence, and more than half a hundred organized before 1850. By 1875 there were about 400 farmers mutuals and by 1900 at least 1,700.

The rapid extension of these companies after 1850 was due in no small measure to favorable state legislation. But in many states these laws had to be secured by the farmers themselves, sometimes in the face of strong opposition. The first law, passed in New York state in 1857, provided that 25 or more persons residing in any township of the state and owning a total of \$50,000 worth of property that they desired to insure might form themselves into a mutual insurance company. They were permitted to insure only buildings and their contents. They could not insure city or

village property, nor could they accept risks outside the borders of the home township. They could write insurance against loss or damage by fire only.

This law, though evidently too strongly restrictive in its provisions, appears to have been the model for similar laws in the Northern Central states generally, and in some 12 other states located farther south and farther west. The early New York law was subsequently repealed and in 1879 a second law, somewhat more liberal in its provisions, enacted. In the meantime Wisconsin, Illinois, Michigan, Iowa, Minnesota, Ohio and Indiana had enacted farmers mutual fire insurance laws, which in general were reasonable and practical in their provisions, or soon made so by proper amendments.

By 1890 practically every state in the Middle West and several of the Southern states had farmers mutual fire insurance laws. Twenty-five of these states have fairly satisfactory farmers mutual fire insurance laws.

While the precise saving in the cost of insurance to farmers through mutual insurance companies is not known, as no special effort has been made to collect lists of commercial rates for farm risks in the various states, it is conservatively estimated that in a number of the states where farmers mutual insurance is most highly developed, the average cost of insurance for all the companies in the state is well below one-half the rates quoted by commercial concerns.

This saving is the result of practical elimination of the feature of overinsurance and the reduction or elimination of expenses of operation, such as commissions, salaries, divi-

dends, taxes, rents, rating charges, legal assistance, etc., which must necessarily be incurred by large commercial companies.

A former state insurance commissioner declared that overinsurance was the cause of a great many of the fires in the United States. When it is considered that the fire losses in the United States since 1911 amount to nearly two and one-half billion dollars—a sum of money that would have paid the cost of constructing the Panama Canal six times over—it can readily be appreciated what a saving of half that sum would mean. But more important than the saving of that sum is the fact that the productivity of armies of men has gone to naught through the destruction of millions of buildings. Whether the buildings were insured or not is beside the point. The important fact is that they have been destroyed and that the energy of armies of other men must be exerted, not to create new wealth, but to replace that which has been so negligently and criminally destroyed.

Farmers mutuals, almost without exception, limit the amount of the insurance written to three-fourths or two-thirds of the actual value of the property. It is obvious that when you limit the amount of insurance to a point that will make it unprofitable for a fire to occur, the owner will exert every effort to safeguard his property by the exercise of proper fire prevention methods.

Further to prevent overinsurance in mutual associations, the agents receive a fixed sum for each policy, whether it is for \$1,000 or \$100,000, instead of receiving commissions on the amount of insurance written. Therefore the association's representatives

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

NEW FUMIGATION ACTIVITIES

A new department has been outlined by the California Fruit Growers Exchange, to be known as the Department of Fumigation and Pest Control, and R. S. Woglum, for so many years in charge of such work for the United States department of agriculture, will be manager. It is understood that Mr. Woglum will take up the new work August 15.

FARM BUREAU MEETING

The American Farm Bureau Federation announces a meeting of particular interest to Rocky Mountain states to be held in Hotel Utah, Salt Lake City, August 20 and 21. It is a conference to discuss the vital problems confronting agriculture. "Special attention will be given problems of farmers in your section. Details and methods of the organization of county and state farm bureaus and cooperation with the state colleges of agriculture will be given a prominent place on the program."

BEET PRICES

Oxnard sugar factory has announced that initial payment to beet growers for this season's delivery will be on the basis of 12 cent sugar. This

is 50 per cent higher than initial payment last year, which was on the basis of eight cent sugar. There will have to be a material decline from present sugar prices or the beet grower will be entitled to several dollars more if he receives payment on the usual basis of one dollar per ton for each cent per pound increase over the 12 cent base. On the 12 cent basis he will now receive \$16 per ton for 15 per cent beets. If final payments are made, say, on 20 cent sugar basis, then an additional \$8, or a total of \$24 per ton for 15 per cent beets. As many of the Ventura County beets will range 20 per cent sugar, this will mean another large addition to his returns. The beet grower who has raised his crop at a net loss will recover some of it with this year's prices.

BIG RAISIN SALE

The sale of 150 cars of raisins in New York at around 23 cents per pound means the disposal of an enormous quantity of a California product at a most satisfactory price. President Giffen says:

"The auction sale held by the California Associated Raisin Company took place as per schedule. Sixty cars two-crown raisins sold at 22.91 cents and 90 cars three-crown raisins sold at 23.61 cents. These were sold on the regular California dried fruit contract for October shipment. E. Y. Foley of Fresno was the buyer of the whole lot."

Later he adds that any rumors as to there being collusion between the Associated and Mr. Foley are untrue, for there was absolutely no arrangement between Foley and the Associated. It was a straight purchase of a great quantity of California products with faith in future prices.

It is probable the Associated will hold another similar auction in Chicago.

NOT DESTROYED

The Colorado agricultural college issues a news note sheet in which various items of agricultural interest are chronicled and passed on to the press. In its last issue it announces that a study is to be made of botulism which has "destroyed the ripe olive business." At least these are the words which appear in the headlines of the article.

This is a bit unfortunate, for it is not true. It goes without saying that the olive industry has been seriously injured by the manner of playing up big headlines in the Eastern papers at the time of the poisoning cases. However, it is not destroyed. Regarding these cases, it was hoped at first that it was some terrible mistake and that olives were not responsible for the tragedies. Plainly, however, improperly processed olives were responsible. The method of the Eastern papers of playing up this fact, however, was most unfair to this industry which is peculiar to California. It goes without saying that this form of poison has existed since people began eating. One of the first cases observed many years ago came from poisoned sausage. Hence, its name, which comes from botulus, Latin for sausage. Canned fruits and other products have since been shown to be carriers of this poison.

This is not reassuring, but it is a fact which we may well realize in order to cope with this danger. The olive shippers and growers have taken hold of the situation with such vigor

that we believe it is safe to say there is no food offered today which is more wholesome than California ripe olives. Nevertheless, the producers are, in conjunction with Stanford, University of California and the Federal Health Service, making scientific investigation. It is announced that the investigation will cover about two years and be thorough in every respect. It is to be hoped the olive people will find means of preventing development of this poison, not only in the olives but all other kinds of food. In fact it is now well known that high temperature is entirely sufficient to assure absolute safety.

UNCONSTITUTIONAL

The California Irrigation Act of 1919 has been declared by the state supreme court to be unconstitutional. The intent of this act and of those who secured its passage through the state legislature was entirely laudable. It was thought to be for the best interests of irrigationists of California, but certain mistakes were made in its provisions, one in particular in that it exempted portions of certain counties from its operation. The decision was rendered in action brought in Madera County and against its board of supervisors because of the creation of an irrigation district covering 70,000 acres.

Unfortunately, lands in other districts will be affected adversely by this decision. For instance, the great Pine Flat project, affecting many of the counties of central San Joaquin Valley, will be put entirely out of commission until new legislation can be enacted or the old proceedings discontinued and steps taken to organize a new project under the Wright or other irrigation law.

Besides the districts in Madera County and the Pine Flat district, three others, Tulare Lake, Mendota and San Jose, all become non-existent under the decision just rendered. Many who are conversant with irrigation laws feel that the best procedure is to organize under the Wright Irrigation Act, which has been tested and declared to be constitutional.

QUALITY UP

Ohio reports the production of 60,570,000 pounds of butter last year, a material increase over former years. However, this leaves her far below the country's big butter state, Minnesota, which now produces 131,000,000 pounds. Iowa is second, Wisconsin third and California fourth, though with only slightly greater production than Ohio. We are not informed as to California quality, but we do know that in the matter of whole milk production no state in the country equals California. We believe the quality of her butter is entitled to the same reputation.

SOME CROPS

Every section of Southern California shows immense production of hay, grain and other field crops. Hay balers are busy, and while threshers have mostly finished their work grain is still stacked in the field. Just a hint to the producers: These products possess great value which is materially lowered in case one of those early fall rains finds them still outside. A September thunder shower is not unknown. Unfortunately car shortage prevents shipping and some storehouses are already full, but the wise farmer will find some method of disposal or of storage.

STILL DOING BUSINESS

(Continued from Page 179.)

contract. In other words, we feel in honor bound to help sustain this contract, though to us it may seem irksome.

And, of course, the last recommendation, which gives us the option of dissolution, is absolutely unthinkable, as there is probably not a single person in the San Joaquin Valley that would like to see this organization dissolved; even the independent packers, who happen to be in most cases growers also, testified before the commission that they would not like to see this happen.

In addition to the points mentioned in these recommendations there were three contentions made to the commission by our accusers, which both they and we believed to be the paramount issues of the controversy. They claimed that our control should be reduced to 50 per cent and that we should be forced to sell to them our raw product that they might manufacture under their brands. On these two points the report, as we now have it, is entirely silent, which we take to be a vindication of our position in reference to them.

The third point was the question of the fairness of our price. On this point we find that in the first part of the report the commission says that our price was unreasonably high, but in the last part they say that in view of the findings of the supreme court in the U. S. Steel Corporation case it passed over the question of the right of the membership of the company to fix the selling price of raisins. In other words, our interpretation of these two findings would be that though the commission, along with all other consumers, object to the high price they were forced to pay for raisins, still in view of the fact that everything else that the consumer is buying was as high or higher they did not feel that our price was, comparatively speaking, out of the way. In this conclusion that the price of all products is unreasonably high we find ourselves in entire accord with the commission.

In addition to this we want to particularly emphasize the fact that the interview appearing in the papers giving the opinion of John Preston was not the opinion of the department of justice, or at least if it was they have not so indicated up to this time. Mr. Preston says that nothing less than the reduction of our control to 50 per cent will satisfy the department of justice, and that the plan of selling raisins at auction is one that should not be tolerated.

The only thing of importance in this connection is that many people understood this to be the finding of the department of justice instead of the opinion of Mr. Preston. At one time Mr. Preston was United States district attorney but is no longer officially connected with the department of justice and is only a lawyer whose opinion on questions of law may be right and may not. His statement shows conclusively, however, that he does not understand the raisin business when he says that loose raisins are not one of the commercial varieties. Up to about 20 years ago there were no raisins known except loose raisins, and even today one-half of the entire Muscat crop has been sold in exactly the same form that we are selling these raisins at auction, and the entire Spanish crop is being sold that way, as they do not seed their raisins; and the fact that they are now buying loose raisins for the purpose of making liquor certainly does not change the fact that they are a commercial variety, as it is just as feasible to make liquor from seeded raisins as it is from those with the seeds in them.

And, finally, we ask you to remember that this flurry has in no way changed the fact that we are still doing business along the same lines as before, and there is certainly no reason to feel that the prices named at this time will not be attractive, as the market is exceedingly strong. There has been no reduction of our control, no grower is released from his contract and the obligations to stand by your organization are greater today than ever before. As to the final results, we feel that there can be but one conclusion, and that is that "right the day will win," and we have not done wrong.

PRACTICAL INSTRUCTION IN
CITRICULTURE

(Continued from Page 177.)

cooperation and good will. They lack the atmosphere of competition so prevalent among industrial activities. This probably explains the great advance agriculture has made in recent years. Through the county farm advisers the farmers are kept in touch with the state university and its work along agricultural lines, and through the county farm bureaus and chambers of commerce they come together for mutual help.

One of the greatest impressions gained on this tour through the state was the large place science has taken in agriculture everywhere. The farmer today understands more or less the relationships between pruning, production, irrigation, cultivation, fertilization, etc., and their whys and wherefores. He understands the mechanics of agriculture, so to speak. Although each has his own working theories, the principles under which they are all working are the same. They are not working blindly.

From the fruit growers of the northern end of the Sacramento Valley to the date growers of Coachella (the extremes of the territory we covered), the farmers we met were educated, alert and progressive, whether working for themselves on a small scale or for a large company.

Wesley Fleming, Orange Cove

Fertilization impressed me as being the most important single factor in the profitable culture of oranges and lemons. I believe this because the soil of heavily fertilized groves is nearly always in much better condition than the soil of poorly fertilized groves; because the water penetration and retention are increased by heavy fertilization; because the condition of the trees is uniformly better in properly fertilized groves, as is shown by color, size and general health conditions; lastly, because the yearly yields are made heavier and more uniform by fertilization.

I believe that cover crops should be the basis of all fertilization methods, as they are the cheapest form available. Their use makes commercial fertilizer more effective and lasting. Manure should be applied by the furrow method if obtainable. Commercial fertilizers of certain kinds can be profitably added if manure is not available, but care must be taken not to use certain commercial fertilizers which are detrimental to citrus trees. I therefore believe that the reason some citrus growers are more successful than others can generally be traced to better fertilization methods.

John H. Irish, Berkeley

Today, as never before in the history of our country, is the producer concerned about the labor situation. Laborers are reaping their harvest; they may ask what they will and the producer must meet their demands or let his work go undone.

What is the cause of this condition? The popular answer to this question today is the "great war." Is there not another answer? Have the relations between the producer and the laborer been such as to avoid such a breach?

In the past the general attitude of the employer has been to get as much as possible out of the laborer with the least possible expense, regardless of his health, happiness or social standing. The attitude of the laborer has been to get as much money as possible for the smallest amount of work. So long as such relations exist between the employer and the employed nothing but unrest, dissatisfaction and antagonism can be expected.

To the extent that the spirit of service can be conceived, born and nourished in both employer and employee, just to that extent can our present labor problem be solved. This has been clearly demonstrated by the experience of the Mills Orchard Company at Hamilton City. Here every effort is being put forth to make living conditions pleasant for the employees.

For the employees who have families cottages have been erected with modern conveniences and the latest improvements. Lawns, flowers and trees have been planted around these, making them attractive and homelike. Provision is made for the obtaining of household supplies at the greatest convenience and economy. A stage is

run daily by the company to carry the children to and from school. For the single men and temporary employees a bunkhouse is provided, which is well furnished, equipped with a dining room, a kitchen and a very efficient Filipino cook. This cook takes great pride in his work. He is not afraid to do more than his own work. He became ill once and went to the doctor and told him that he was ill because he had not enough work to do. Upon hearing this Mr. Mills furnished the ground and allowed him to raise his own vegetables for the ranch. He was delighted with this. He now raises all the vegetables used on the place, does the work himself and has not been ill since.

The bunkhouse is provided with a library of between six and seven hundred volumes, which furnishes a profitable pastime for the men when not at work.

What is the result of all this expense and concern shown for the employees? Does it pay? The result is that this company has no labor trouble. The men who come here to work remain. They do not come and stay a few days and then leave because of dissatisfaction. The present crew is made up of men who have been in the employ of the company from three to 18 years.

Does it pay to treat employees thus civilly?

If employers who have labor troubles would note this experience they might find a solution for their problem.

H. R. Schlapp, Melbourne, Australia

Perhaps the most noticeable feature of the trip was the extreme importance of fertilization in the citrus groves in order to maintain successful bearing. That a rational program of fertilization is essential was impressed upon me at almost every grove we visited, for the benefits that had been derived from such fertilization were extremely obvious.

The fertilizers that appeared to have given the most satisfactory results were the manures of various domestic animals, ordinary barnyard manure, sheep manure and chicken manure having stood out conspicuously. They seemed to have produced healthier trees and heavier yields than most of the commercial fertilizers. From the latter a distinctly harmful effect, on some soils, was noticed where there had been a continuous and heavy use of sodium nitrate, due, I should judge, to the presence of an excessive amount of sodium.

The importance of a goodly amount of humus in the soil and of a good physical condition when the fertilizer is applied is great, and this serves to emphasize the importance of winter cover crops in groves.

In applying the fertilizer most satisfactory results appear to have been obtained where deep furrows are utilized. By this method excessive losses from oxidation are eliminated and more of the plant food in the fertilizer is available to the plant roots. The furrows between tree rows are alternated so that the previous applications of manure are not disturbed and an even distribution of fertilizer is obtained.

E. G. Schlapp, Melbourne, Australia

In trying to decide upon the particular cultural method that has impressed itself most deeply on the mind, one comes to realize the very wide diversity of methods being used with apparent success in different parts of California. There is one thing, however, upon which almost all growers universally agree, and that is the great need of organic matter on almost all California soils.

Any system of cultivation which does not produce sufficient organic matter from the land itself cannot be regarded as a stable form of agriculture, or one best adapted to the country as a whole.

A method of cropping which does supply sufficient humus from the land itself, and which has the additional advantage of combating to some extent that scourge of the citrus grower, June drop, is now being worked out with marked success on several orchards in the state. Simply it is the growing of a winter cover crop, such as melilotus indica, which can be turned under very early in the spring, followed almost immediately by a summer cover crop of melilotus alba which

(Continued on Page 186.)

"THE ONLY 15-25 Tractor Capable of Pulling Three Plows on High Gear Around Here"

"I have just finished the threshing season pulling a 24" separator. I had plenty of reserve power at all times. In plowing the LAUSON seems to be the only 15-30 tractor capable of pulling three plows around here. Practically all the other machines use only two plows or plow on low gear. It is the best kerosene burner I

know of, using the lowest grade kerosene which will hardly ignite with a match and burning it without smoke or odor whatever."

This is a strong testimonial for F. B. Burns of Hornick, Iowa, to write. But it is the kind of service LAUSON Tractors are giving all over the country.

Year after year the LAUSON Tractor has gained favor with the better class of business farmers —men who consider service and satisfaction rather than price. You will usually find LAUSON owners the leading and most prosperous farmers in the locality.

Write for our new catalog which illustrates and describes the construction of the Lauson—the "Pattern" Tractor.

Gentlemen:—

Have just finished the threshing season pulling a 24" Advance Reelley machine with only 15 minutes' stop for tractor, a broken fan belt and a clog in carburetor. Had plenty of reserve power at all times.

In plowing the Lauson seems to be the only 15-25 or 15-30 tractor capable of pulling three plows on high gear around here, practically all the other machines use only two plows or plow on low gear.

It is also the best kerosene burner I know of, using the lowest grade kerosene that will hardly ignite with a match without any smoke or odor whatever.

Yours truly,
(Signed) F. B. Burns

Work of the "Crypts"

By Ernest Branton

CRYPTOLAEMUS Montrouzieri is too long a name for practical purposes, so those who handle these beneficial ladybugs call them "crypts." Wherever introduced they have done wonderful work in the destruction of mealybugs of all kinds. In October, 1918, the Cultivator gave description of the work of these ben-

derful work has been done by them in Africa, Australia and elsewhere, and as long ago as 1895 the commissioner of agriculture at Honolulu, J. Marsden, wrote to California: "The cryptolaemus has done wonderful work on these islands; it has not only entirely cleaned out a Pulvinaria that threatened the total extinction of our growing coffee industry, but also a serious

Catching Adult Ladybirds

H. M. Armitage, shaking cryptolaemus from branches of the lemon trees in the Culp orchard in Ventura.

eficial insects, with illustrations taken by the Cultivator camera with the aid of H. M. Armitage, in charge of the branch of the state insectary located at Alhambra. Mr. Armitage has been in charge of the crypt family for some years and the beneficial work

blight, Dactylopius albizzi (a mealy bug), that was destroying all our citrus trees. Now it is seldom that any of the scale can be found, and the citrus trees are bearing good crops this year."

In many square miles of citrus or-

Migrating

Pasture is getting short in tree top. Hence the little crypts are migrating to grow up in another tree, and they may be seen on tree trunk and heater in the above photograph. Photos by California Cultivator.

accomplished has been most astonishing. Assistance has been rendered by A. A. Brock, horticultural commissioner of Ventura County. As the former article referred to some of the work done under Mr. Brock's supervision, another look in at some of these orchards should prove informing.

Splendid results have been obtained. As the writer stood in the orchard of L. E. Mills at Santa Paula, Mr. Mills said:

"This old lemon orchard was in a most deplorable condition, and fumigation did nothing for it so far as the mealybug was concerned. I double dosed it and burned the trees, single dosed it with doubled exposure and burned the trees, gave an ordinary fumigation and still burned the trees, but all of it did not burn the mealybugs. The crypts were turned loose and the deed was done; there is not a mealybug in the orchard and the crypts are everywhere. They are even falling off the tree under which we stand onto the tents where the Australian citrus students sleep."

On looking up the lower branches of the Norfolk Island pine, Araucaria excelsa, were seen to be covered with remains of the white araucaria scale, Eriococcus aracariae. All were found dead and only the "skins" remained. The crypts kill all mealybugs and closely allied insects and should be liberated freely in parks and gardens as well as in orchards. Won-

chards in the Santa Paula section the owners are jubilant over the work of the crypts. On the large Limoneira

tract they have two insectaries and are hatching their own. There is a branch state insectary containing 30 cages, each capable of turning out 500 to 1,000 crypts each month. The present is the most active season and the one of largest output, June, July and August being the best months for the insects. For the year ending June 1, Mr. Brock had liberated from these cages into Ventura County orchards the following beneficial insects: *Cryptolaemus Montrouzieri*, 32,665; *Tanatomastix abnormis*, 143,000; *Hyperaspis lateralis*, 354; also a few of other species. This insectary is working to full capacity, is in splendid order and condition and Ventura County citrus orchardists know the days of the mealybugs are numbered, and they are not many.

Book Review

HELPING MEN OWN FARMS

"Helping Men Own Farms," by Prof. Elwood Mead, published by the Macmillan Co., New York, is \$2.25. We recently referred to this book on editorial page and hope it will be widely read. The book is true to name in every suggestion. In every word it is an education for the man who will read and who wants to better the community through helping men own their farms. The publishers say:

"As the cost of living has steadily increased the attention of people everywhere has been directed to a more economical and efficient administration of farms. This new volume by Professor Elwood Mead is a thoroughly up to date discussion of government aid in land settlement, dealing chiefly with methods and results in California and Australia. All the various questions relative to farm management are treated in a practical, concise, yet comprehensive manner."

The book consists of a dozen half tone illustrations, 14 chapters of text and an appendix which includes the California Land Settlement Act. The chapters touch upon State Aid in California, National Carelessness, Australia's Influence, State Aid in Italy, Denmark, Holland and the British Isles; State Aided Settlement in Victoria, Practical Teachings, Defects of Private Colonization Schemes, California's State Settlement, Social Progress, Capital, Lessons, Homes for Soldiers, Function of Government. Writing to Dr. Mead regarding this book, Edwin F. Adams says:

"Have just read your book about helping the poor man get a farm with interest and delight. I finished at one sitting, 3 to 9 p. m., with half an hour off for dinner, which is conclusive evidence of real interest, the more so as much of it was not new to me."

"Your description of Durham recalled the days when I as a farm laborer worked also from sun to sun and helped do the chores before and after; and where later, as a farm owner, my wife and I rose at 4 in the morning six days in the week for six or seven months in the year to milk ten cows, work before breakfast, and on Sunday slept an hour or more later and rode to church comfortably in the big farm wagon. Durham seems to have the spirit of the good old days unimpaired and with modern improvements."

"The gospel of work is a fine gospel. I remember Shepparton, Echuca and Bamawm, or whatever the name is, very well and would gladly revisit them to see what is growing on the fields mostly then vacant. From such chats as I could get with the settlers and their wives I found them very different from the American species of pioneer. They were evidently thinking not for how much they could sell out pretty soon, but of what a fine home they were going to have."

"If you could make all California fit your description of Durham I should feel inclined to get a doctor to try that new fangled bridge grafting or whatever you call it, on a fellow's insides and begin life over again in one of your colonies."

HER EXPLANATION

"Bessie," said her mother, "why is it that you and your small brother are always quarreling?"

"I don't know," returned the child, "unless I take after you and he takes after papa."—Boston Transcript.

If you can extract a laugh out of every solemn situation you'll live to be a hundred without half trying.

"How a new kind of farm hand added acres to my farm"

A regular man's size outfit, able to do a man's work

Editor's Note: W. E. Shetrone, a farmer near LeRaysville, Pa., shows how you can help to solve your labor problem.

"Now, I'm not going to tell you that the Western Electric Power and Light Outfit is the best on the market. The chances are you know more about farm plants than I do. All I want is to tell how this outfit has been doing a man's work on my place—when men are hard to get. That is how it saved time enough for me to cultivate seven acres more last spring."

W. E. Shetrone

LeRaysville, Pa.

Mr. Shetrone's house is pleasantly located

LAST YEAR I was struggling along with my little farm—milking by hand, taking a two-hour trip to the creamery every day, working hard to support my family. Then a salesman showed me how I could do the work in less time and with less effort by installing Western Electric Power and Light equipment. Well, I put the apparatus in, and right from the start it began to save time and labor. In fact, the time it saved me made it possible to plow seven acres more last spring.*

A powerful outfit for heavy work

"Power ought to be the first consideration in buying a farm plant. There are plenty of good electric sets satisfactory for light-

ing. But not many of them are strong on power. You can't expect them to do the hard work."

"The Western Electric has a three horsepower engine, which as you know is ample to run most all the machinery. Grindstone, feed-mixer, churn, mill—you can operate them all together from a shafting hitched up to this powerful engine, because there's a pulley on it for just such work."

"In generator and battery too, power is the feature that impressed me most. My Western Electric outfit furnishes plenty of electricity to light the house and barn, and at the same time it runs the pump, the milking machine and such household appliances as a vacuum cleaner and a washing machine."

*What the Western Electric Power and Light Outfit did to make Mr. Shetrone's farm more productive, it can do for your farm too.

Working Hour Cost

Some tractor purchasers make the "Caterpillar" their choice because of its big power. Some choose it for its ability to meet exceptional ground or road conditions. Some choose it for its dependability—freedom from delays. But the deciding advantage in most cases is its low cost per working hour, which means increased farm profits. Our folder "What Are Your Power Needs" will help you in the choosing of a tractor for your work. Send for it.

PRACTICAL INSTRUCTION IN CITRICULTURE

(Continued from Page 183.)

will be of sufficient height during the fruit setting period to afford shade to the ground. This produces a more uniform temperature in the soil and surrounding atmosphere than where clean cultivation is followed, and a corresponding decrease in the ravages of June drop. Earliness being an essential factor, it is necessary that some crop be planted the seed of which will not rot in the ground, and white clover has been found very satisfactory for the purpose. Unfortunately, water conditions make summer cover cropping impracticable in certain districts, but it has been noticed that where this method has been intelligently followed not only has the soil been in fine tilth, but as a result the orchards were invariably more thrifty than others in the same neighborhood.

Mrs. Frederick Ellicott, Berkeley

One lesson which has been most forcibly borne in on me during the summer traveling course is the need for what may be called an individual system of pruning for citrus trees. As yet so little is known about the way in which these trees can best be pruned that all work is more or less experimental, but it looks as though at least two false ideas were being slowly discarded by the growers and trees are no longer being pruned to improve their appearance or because pruning alone is supposed to increase the crop.

It is probable that a healthy, well cared for tree which is doing its full duty looks better than one which is ill conditioned and unprofitable, but pruning should primarily be directed toward improving general conditions and not toward improving appearance alone; and this should be kept in mind even if the result is not to produce an orchard which looks like a background on the cover of a Vogue magazine.

Obviously, pruning of itself does not increase the crop. For one thing it lessens the area on which fruit may be borne but it may be the cause of better fruit. A pruner, to be successful, should aim at three things—to keep his trees a manageable size; to prevent their becoming so thick that all the fruit grows on the outside; to eliminate undesirable types of growth. But these things cannot be accomplished by going into the orchard with set ideas of what is to be done. Citrus trees vary in the character of their growth, not only from each other but even in different parts of the same tree, and it is this instability of character, combined with the fact that citrus is here being grown out of its proper environment, which makes the handling of them such a difficult task and makes the need for an individual system of pruning almost imperative. Each tree should be pruned on its own merits—or demerits.

FARMERS MUTUALS

(Continued from Page 181.)

constantly seek to protect the association, a policy that is proportionately beneficial to the members who make up the organization.

The systematic inspection of risks is another factor in preventing fires and reducing the cost of insurance to a minimum. Statistics prove that defective flues and heating apparatus are among the most frequent causes of loss of farm property by fire. These sources of fire loss can be very largely removed by proper inspection, the importance of which is fully appreciated by mutual associations. The achievement of factory mutuals in reducing their rate of insurance costs by more than 90 per cent during a period of 50 years, in a measure has been ascribed to the thorough and systematic inspection of risks.

There are many general farm mutuals that have achieved similar results through the adoption of this practice. One outstanding example is that of The Svea Mutual Protective Insurance Company of Illinois. This company, organized 50 years ago, makes an annual inspection of risks. It has over \$10,000,000 of fire insurance in force, the average cost of which, covering the entire 50 year period, has been less than 7½ cents per \$100 per year.

One of the notable achievements of cooperative insurance has been the de-

velopment of community spirit. The farmers have come to learn that large rewards come through cooperation and interdependence. The success enjoyed in mutual insurance, moreover, has been an impetus to cooperation in other fields of endeavor. These take the form not only of cooperative marketing and purchasing organizations, but of cooperative telephone companies, cooperative motor truck routes, and an infinity of other cooperative arrangements among farmers. Of course, it must not be overlooked that these associations sometimes fail, but the reason for that is the practice of faulty business methods and a lack of cooperative spirit on the part of each and every member of the organization. Unselfishness must be the watchword if the association is to succeed.

The office of farm management of the United States department of agriculture has made an intensive study of all forms of cooperative endeavor, including farmers mutual fire insurance companies. The office will gladly assist, without charge, any individual or community seeking first hand authoritative information on the subject, not only with regard to the general benefits and advantages to be gained, but with regard to methods of organization and details of conducting the business.

FIG AND PEACH MERGER A SUCCESS

After a campaign covering a period of two months the directors of the California Peach Growers have announced that they have secured contracts covering 75 per cent of the peach acreage and at the same time stock to the extent of one-half million dollars, and 75 per cent of the fig acreage has been signed by the fig growers of the state. The necessary legal steps to complete the merger of the two marketing organizations will be taken in time to handle the 1921 crop of figs. The 1920 crop of peaches will be handled by the association under the old contract.

The new association will begin work immediately, installing the necessary machinery and equipment to handle the fig crop, and it is expected that, inasmuch as the fig and peach acreage is largely in the same districts, the substantial buildings already put up by the peach association will serve the dual purpose admirably.

The success of the Peach Growers in marketing the dried peach crop of the state has been almost spectacular. Coming into existence as it did when peaches were selling for two or three cents and less and the grower was pulling out his trees, it seems nothing short of a miracle that the company could market the crop and pay the grower six cents per pound the first year. Growers received better than 14½ cents for their 1919 crop of peaches. The fig market is at low ebb at this time. In spite of the fact that the bulk of the crop last year sold for high prices, 20 cent offers not being uncommon, the grower has heard nothing above five cents this year.

The association will undoubtedly confine its activities this season to standardization, improved methods of packing and advertising, and possibly some assistance in marketing the bulk figs.

The new peach and fig contracts are practically identical and call for delivery to the association for the next four years with an option for four more years which may be exercised by the association. When the campaign started the Peach Company announced that unless at least 75 per cent of the acreage was signed up the contracts would be returned and the association would go out of existence after marketing the 1920 crop. The action of the growers in again signing the contracts insures the industry for another eight years, and with the addition of the fig membership the new company will become one of the really big cooperative marketing organizations of the state. —F. K. H.

A \$1,000 SPRAYER

One of the last official acts of Horticultural Commissioner Brock of Ventura County, was the purchase of a fine spraying machine at a cost of \$1,067. It is a horse drawn vehicle capable of supplying spraying material under 250 pounds pressure to each of four hose attachments. It will be used principally for black scale on apricots,

for codling moth on apples and red spider on lemons. On August 1 Mr. Brock retired from his former official position, after eight years service, to take charge of field work for the Santa Paula Citrus Growers Association. He has been succeeded by Chief Deputy Call.

NATURAL INFERENCE

The street car was passing a glue factory, and the odor emanating therefrom was decidedly obnoxious. The prim young lady took out a bottle of lavender salts and sniffed vigorously. Finally the man behind her tapped her on the shoulder.

"You'll have to cork up that bottle, lassie," he said. "I can't stand that smell any longer."

If You Can Afford It

it's dandy fine to ramble around in your automobile; to sniff the fumes of the gas and rub off the rubber on the highways, even if the experts say it costs about 8c a mile for Henry and 11 to 14c a mile for the other kinds. BUT CAN YOU AFFORD IT?

You CAN Afford

to take interesting little journeys to places of pleasure as well as trips for your business needs at about a cent a mile for daily travel and less than 3 cents for your occasional trip over lines of this railway.

And That's Not All:

We carry the risk and the worry, that you assume when you use your machine.

The Standard Equipment on Up-to-date Farms Test Special Belt

WITH SIX BILLION DOLLARS invested in farming in the United States, modern farm owners cannot risk losses through inferior equipment.

The Test Special Belt, by actual performance, has proved itself an assurance against power losses and costly delays through breakdowns.

"Test Special" is the best rubber belt made and is especially adapted for hard outdoor usage.

See your dealer.

Any Dealer anywhere can buy "Test Special."

WRITE TODAY, giving the R.P.M. and diameter of the driving pulley—also driven pulley and distance between centers of same; also give the rated horsepower of your motor or engine, and name kind of machinery you are operating. We will reply immediately giving you our recommendation as to kind of belt to use.

Write today.

TESTED BY EXPERTS

University experts have tested and approved the De-Hy-Dro Drier as the ideal machine for orchards of small acreage. The De-Hy-Dro gives absolute insurance against loss from early rains.

Dries one to three tons of green fruit in 24 hours. As a finisher or emergency drier in case of rain, it will handle many times that amount in a few hours. Price \$1,000. No fans or moving parts. Portable. Easy to operate. Gross profits the first year two to three times the cost of your machine. Order early to insure delivery.

Write today for descriptive folder.

Motor Trucks on Eastern Farms

WHAT do you find to be the greatest advantage of owning a motor truck? Of 753 owners of motor trucks who were asked this question by the United States department of agriculture, 91 per cent said, "Saving time."

About 25 per cent of these men had better markets since buying their trucks, but 50 per cent of them had not cut down the number of their work stock by as much as a single head, while less than one man in ten had cut down his work stock more than two head.

"Which merely goes to show," says a department specialist in farm power, "how difficult it is to arrive at a definite conclusion in a matter like this motor truck study. It would certainly appear that any saving attributable to the motor truck on the farm is in time rather than expense. Most of these men think that the profits accruing from the saving in time more than overbalances any extra expense entailed by the use of the motor truck. It is significant that the majority of these farmers are located a considerable distance from market, more than four-fifths of them being five miles or more from their shipping points, and the saving in time effected by their use of trucks is naturally greater than it would be on the average farm which lies nearer to market than do most of the farms concerned in this investigation. The experience of the 753 farmers who have contributed to this study should enable the farmer himself to judge with a fair degree of accuracy as to whether the motor truck would prove advantageous under his conditions."

The investigation in question was made during the past winter and spring in Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware and Indiana.

In the opinions of these men the principal disadvantage of a motor

truck is "poor roads."

As compared with horses and wagons, the trucks save from one-half to two-thirds of the time required for hauling materials to and from these farms.

These farmers have return loads for their trucks about one-fourth of the time. A majority of them still use their horses for some road hauling.

The owners estimate that on the average their trucks travel 3,820 miles per year and are used on 173 days per year.

The average life of the trucks is between six and a half and seven years, and in most cases depreciation is the largest single item of expense in connection with their operation.

The average cost of operation of the one-half ton trucks was about eight cents per mile, of the three-fourths ton trucks about 13 cents, of the one-ton about 12 cents, of the 1½ and 1½ ton about 19 cents, and of the two ton about 20 cents.

The average cost of hauling crops, including the value of the driver's time at 50 cents an hour, was about 50 cents per ton mile with the one-half ton trucks, 34 cents with the three-fourths ton, 26 cents with the one ton, 24 cents with the 1½ and 1½ ton, and 18 cents with the two ton trucks.

About four-fifths of the men state that their trucks decrease their expense for hired help. On the average they estimate that this decrease amounts to \$324 per year.

Over half of the 205 truck owners whose farms contain more than 120 crop acres own tractors. The number of work stock kept on the farms where both trucks and tractors are owned is only slightly less than the number kept on farms of corresponding size where only trucks are owned.

We may be mistaken, but we believe that a similar investigation conducted in California, with its good roads, would make a showing far more favorable to the trucks.

Cooperative Grain Elevator Companies

In the United States there are some 14,000 cooperative marketing associations. To many of them the bureau of markets has given valuable assistance by furnishing specimen copies of by-laws and by indicating proper methods of organization and administration.

"The Organization of Cooperative Grain Elevator Companies" is the title of Bulletin No. 860, just issued by the United States department of agriculture upon this subject. The bulletin is addressed to those who desire assistance in the formation of cooperative grain elevators, but the subject matter is treated in a manner that makes the bulletin of interest to those engaged in other lines of cooperative endeavor as well. The scope of the pamphlet is limited to matters regarded as fundamental and general, and it is intended that the suggestions and recommendations be considered with reference to and in connection with special cooperative laws and the laws governing corporations in each of the several states of the Union.

The bulletin points out that the success of any organization, whether cooperative or for private profit, rests upon social or economic need, a sound organization plan and efficient management. It then details the various factors that produce these basic conditions. It dwells upon the organization of joint stock companies, private corporations of the capital stock form, and cooperative associations incorporated under special cooperative law, the three common forms of organization of farmers elevator enterprises in the United States.

Under the chapter of preliminary survey, matters of local conditions, prospective membership, capital, volume of business and methods of survey are covered. Then the processes of actual organization are discussed and a suggested form of by-laws given.

The bulletin also contains some general suggestions regarding the selection of the plant, the choice of directors and a manager, a maintenance agreement, emergency capital and speculative tendencies. The appendix

gives detailed forms to cover every phase of the administration of the organization from a capital stock subscription contract to a form of stock certificate, and service and maintenance agreement.

The pamphlet has been written by experts in matters of cooperative associations. It is the composite result of actual experience and should prove of valuable assistance to those interested in cooperative marketing. The bulletin may be had upon request of the United States Department of Agriculture, Washington, D. C.

KILLING DODDER

We recently answered a question as to control of dodder in alfalfa in effect that torch or fire from burning straw would prove effective. This reminded an old time subscriber of information which he had formerly furnished us on this subject, and he writes:

"Some ten years ago I wrote an article for your paper in regard to the use of a blast torch for the control of dodder. This article caused some little comment at the time and I received a great many letters regarding it. Since that time I have seen published in your paper and other journals, as well as in government bulletins, means of eradicating the so-called pest. Lately I noticed an article in which you suggested the burning of straw or the use of a blast torch "such as is used by plumbers." I cannot see how such a torch could be used with any effect, and, to say the least, in my mind the burning of straw is unsatisfactory.

"The blast torch, or 'pear burner,' as it is called by the manufacturer, is a brass tank which holds about two gallons of gasoline, which is strapped across the shoulder, and to this is attached a one-fourth inch pipe about five feet long with the necessary valve, pressure pump and swivels. On the end of this is a large burner which, when properly generated, will throw a flame I should judge ten inches in diameter and three feet long, that is,

when turned on full force. The valve is always under the left hand and as soon as the full force of the blast is not needed it can be shut down so as to save the gas.

"Several years ago I bought the ranch we are now on and never in my life did I see as heavy a crop of dodder on a seven acre piece of alfalfa. When the first cutting was taken off there were places that were a solid blanket as large as 100 feet square. The next cutting it could scarcely be found. This was done at a cost of not to exceed \$1 and one day's work, which covered the field three times.

"Cut the alfalfa close, then pass the flame over what might be left. Do this again in a week, then the third, and presto, it's gone!

"Dodder, so far as I have known, has been considered a pest, but if properly handled is not a pest and can hardly be called a bother."

SAN GABRIEL VALLEY SPUDS

Diggers and pickers are at work in the McSweeney ten acre lot of White Rose, pictured in the Cultivator of June 19. This field was planted about March 15 and it was anticipated could be dug about June 20. But cool weather prolonged the season until July 6. Just what the entire ten acres will yield cannot be told just yet, but on June 7 the yield was running about 140 sacks of fine spuds to the acre.

Potatoes throughout the valley promise well, but there are a few exceptions. From various parts of the south come reports of vigorous vines but no tubers, or at least very few. At San Gabriel the same trouble is experienced to some extent, and one plot of British Queen was found in abundant vigor above but no crop below. This condition is no doubt due to climatic deficiencies and cannot be overcome or improvement made by any known method of treatment. Turning under and planting some other crop is recommended.

NEWLY SETTLED VALLEY

One of the newer producing sections of California, in San Diego County, is Verruga, a mountain valley just south of the Warner Ranch. One of its warmest friends, W. H. Sharp, and an old subscriber to the Cultivator, writes:

"This is a plateau of 5,000 acres on the western slope of the rim that divides the desert from the Warner Ranch country, north of Julian a few miles in the so-called snow belt of the Volcan Mountains. There are 40 homesteaders in the valley; no old farms to show what the country is adapted to. It is a vast brush patch. The land cleared is very fertile, producing wheat of fine quality from 15 to 30 bushels per acre when sown in November or December, milo to perfection, fair crops of broom corn, late crops of melons, cantaloupes, some experimenting with cotton, which looks fine at present writing, without irrigation. The average rainfall since I have been here has been more than 18 inches, this year 22½ since last September, not including two thunder showers the last ten days, which have revived the corn and vegetable crops."

LAKE TAHOE HAS SHRUNK

Lake Tahoe in California is often said to occupy an old volcanic crater. This is not a fact. It is true that the region about the lake shows evidence of volcanic activity of various kinds and that the water has at times probably been dammed by outpourings of lava, but the lake itself lies in a structural depression—a dropped block of the earth's crust.

The prehistoric Lake Tahoe was larger and deeper than the present lake, according to the United States geological survey, department of the interior. During the Neocene epoch and the earlier part of the Pleistocene epoch its water stood much higher than now, but in its overflow it has since cut through the lava dams that maintained it at that height. Distinct beaches that mark the former higher levels of the lake stand about 100 feet above its present surface, but the water doubtless once stood at even greater heights. At Tahoe City the most distinct of these old beaches is a terrace that stands 35 to 40 feet above the level of the lake. It is on this ancient beach that Tahoe Tavern is built.

A Real Kerosene Engine in a Real Tractor

Emerson-Brantingham Implement Co.
Established 1852 Rockford, Illinois

A Complete Line of Farm Machinery Manufactured and Guaranteed by One Company

B. Hyman, Inc., Los Angeles, Cal.

G. B. & R. Tractor & Imp. Co., Sacramento, Cal.
H. C. Shaw Co., Stockton, Cal.

The engine in the E-B 12-20 tractor burns kerosene as clean as you could wish. For this engine is not a mere adaptation of a good gasoline model—it is designed for the special requirements of kerosene.

As an example, consider the way in which this engine vaporizes the fuel mixture. The kerosene is mixed with a water jet as it enters the enclosed intake manifold. Then whatever portion of it is still in the form of fine spray falls on the horizontal bottom of this manifold and is instantly vaporized.

This is one feature of the E-B engine design. Many such features give it the great surplus power and economy that have made it famous both in the field and in competitions.

And the tractor as a whole measures up to the engine. Gears are drop forged, steel cut and heat treated. All gears are enclosed. The best anti-friction bearings money can buy for every important bearing surface. Building a machine dust proof insures the life of this machine better than a life insurance policy.

Let your dealer tell you the many other points of advanced design and manufacturing integrity.

Save Money—Buy Pipe From Us

Farmers, Miners, Builders—people in every kind of business are saving money buying used or renewed pipe from us. We sell every kind of pipe. Send in a list of your requirements today and get our prices. We have saved hundreds of people 33 1-3 to 50% on their pipe bills. Here's a partial list of some of the miles of pipe we have in stock for immediate delivery:

8000 ft.	6-Inch Riveted	16 gauge
700 ft.	8-Inch Riveted	16 gauge
5000 ft.	12-Inch Riveted	12 gauge
1000 ft.	18-Inch Riveted	12 gauge
800 ft.	22-Inch Riveted	14 gauge
300 ft.	24-Inch Riveted	14 gauge
500 ft.	36-Inch Riveted	12 gauge
10,000 feet	light wrought iron 8-Inch pipe with cast iron collars.	

All above pipe thoroughly overhauled and inspected and ready for immediate use.

We also have large quantity standard pipe and screw casing, pressure tested and guaranteed.

Don't delay—write for our prices on your pipe requirements today.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Drying Thompsons

Please give method of drying Thompson Seedless grapes.—Subscriber, Sacramento.

In the San Joaquin Valley Thompsons are dried in the same manner as Muscats, namely, placed on wooden or paper trays in alternate rows of the vineyard and allowed to dry in the sun. When partially dried they are turned so the other side of the fruit is exposed. When sufficiently dry they are placed in sweat boxes for the purpose of equalizing the moisture content of the berries. In the Sacramento Valley the drying season is not usually so favorable, so the fruit is dipped in a hot lye solution, which cracks the skin, thus shortening the drying time. Because of equipment costs for handling this work economically, commercial dry yards handle most of the tonnage for the individual grower.—F. K. H.

Perennial Rye Grass

Please tell me about perennial rye grass: Best time to plant; yield per acre, feeding value; how long a stand

lasts; will it yield heavier the second year than the first; will it stand close pasturing; is it hard to kill out if plowed under? Our soil is clay but fairly well drained, though some water stands on it during heavy rains.—Subscriber, Lower Lake.

September is a good time to plant. The yield per acre is about three-fourths ton to a cutting and it can be cut not more than three times, but its chief value is as pasturage. The feeding value is good. Some growers sow it every year, while under favorable conditions it lasts for years, though in this respect Italian rye is superior. The yield will be heavier the second year and it bears close pasturage well. It is not hard to get rid of by plowing under. It is believed that Italian rye will serve the reader better than that known as perennial rye.—E. B.

Plants Wilt

C. Hattada, P. M. Sugita and M. Tashima of Montebello complain of wilt of rhubarb, young violets and asters, also of other plant troubles. All three plants named need an abundance of water in hot summer and will sometimes wilt in spite of a good supply. Red spider sometimes kills young violets. Plenty of overhead spraying with water will kill them, but a lime-sulphur spray is better. Young

asters are killed by both root aphid and mealybug. Look at roots and if either are present spray or soak soil with a liquid made from a 40 per cent nicotine base according to directions on package. As to best potatoes for new soil, there is no preference; White Rose, Red Rose, British Queen and Scottish Chief all are good. The simple statement that tomato and potato plants die gives us no chance to prescribe. We should have symptoms and general behavior as well, also soil conditions and care given.—E. B.

Mealy Bugs

What is the best spray for mealy bugs?—Subscriber, Glendale.

The subscriber does not say what plants are infested, but assuming it may be citrus trees, which are susceptible to the attacks of the mealy bug, we would apply at once to Mr. Armitage at the state insectary at Alhambra and ask for colony of Cryptolaemus, which will in all probability be sufficient to fix the mealy bugs so that no spray whatever will be necessary. If, however, spraying is preferred, a distillate emulsion is perhaps best. Owing to the woolly covering an oily spray seems to be the only one which will penetrate and reduce the pest. The Cryptolaemus, which is a natural enemy of the mealy bug, is doing some remarkably fine work as shown in the story in this issue regarding its work in Ventura County.

Filter for Vinegar

Can you suggest how to make a "home made" filter for vinegar? Have a quantity of cider vinegar which we wish to filter.

We know of no filter better than the ordinary filter paper folded and put in the funnel. Many prefer the filter of absorbent cotton plugged, either loosely or tightly according to the liquid to be filtered. This cotton may be had from any druggist, and placed in stem of funnel, glass preferred, it works perfectly. If, however, the work needs to be done in large quantity, we should think one or more thicknesses of muslin stretched over head of barrel or keg would make acceptable filter.

CURING PRUNES

An old time method given in the columns of the Cultivator some years ago as described by Mr. Richmond, a large San Jose grower, is as follows:

"The green fruit is hauled to the dipper shed in picking boxes and there passed through a light solution of lye. A kettle or tank holding 200 gallons of water and a basket container are used for this purpose. In many instances the fruit is rinsed by passing from this dip into a vat of clear water and is then dumped onto a combination pricking board and grader, which grades the fruit into three grades so that the drying in the field can be uniform, the grader being operated by power. The fruit is then placed on eight foot trays and taken to the drying yard and dried in the sun. The purpose of passing the fruit through the lye solution and over the pricking board is that the skin may be slightly cut, thereby preventing fermentation and producing a fruit with a clear bright meat. Many of the small growers do not use the combination pricker and grader; they dump the fruit directly from the dipper basket to the trays, allowing all sizes to be dried together. This is not as satisfactory to the grower as the first mentioned method. The most satisfactory and economical method of handling from the dipper shed to the drying yard is to use a one horse truck especially constructed for this purpose.

"The question of drying is again a matter of judgment. Fruit should be allowed to lie in the sun on the trays until about three-quarters dried, and then be packed in piles one above the other, leaving air vents on either end. About 20 trays can be stacked in one pile where the finishing process takes place. Under normal weather conditions it takes from ten days to two weeks to cure prunes. It has been found most satisfactory while the fruit is on the trays in the dry yard to give at least one turning by hand, shaking the trays, or with brooms, so that the fruit secures an equal drying on all sides. It also materially lessens the

Spring Tooth	Farm Tractors

John Deere Implements are Distributed From All Important Trade Centers. Sold by John Deere Dealers Everywhere.

A GOOD disc harrow that you can use either with horses or tractor has a special advantage these days. It makes good work certain, no matter which pulling power you use, and it saves you the cost of a new harrow when you change from one pulling power to the other.

JOHN DEERE PONY TRACTOR DISC HARROW

This double-action disc harrow quickly can be converted into a horse-drawn, double or single-action harrow by using the hitch that we can furnish for that purpose.

Does a complete job of disking—the John Deere Pony Tractor Disc Harrow penetrates and pulverizes thoroughly because the low hitch and the low coupling between front and rear gangs hold discs to their work.

This harrow is flexible—each gang works independently—obstructions in the field do not lift the entire harrow out of the ground. And the front section can be

furnished equipped with the famous John Deere third lever and powerful pressure spring—the feature that makes possible disking at even depth entire width of harrow always—in dead furrows as well as on ridges. Light running—There is no dragging around corners—the rear gangs trail properly and run steady because the reinforced goose-neck connection to rear gangs is attached ahead of the front gangs.

Can be used with any standard tractor. The John Deere Pony Tractor Harrow clevis is adjustable to suit the height of any standard tractor drawbar.

Free Book "Bigger Crops from Better Seed Beds"—24 pages attractively illustrated—tells when and why to disc. Also describes the horse-drawn and tractor harrows to use. Write today to John Deere, Moline, Ill., and ask for booklet PT-57.

JOHN DEERE
THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

Sulphur

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand and Fleur de Soufre, packed in double

sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Sulphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men \$5 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 110 pounds per acre of TORO BRAND SPECIALLY PREPARED AGRICULTURAL SULPHUR—or our DIAMOND "S" BRAND REFINED POWDERED SULPHUR. This soil treatment has increased various crops up to 500%. Send for Circulars No. 6 and 7, and circular letter of information, "To Whom It May Concern".

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur, Mixtures, etc.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO.

time of drying and makes a finer grade of fruit. Do not take your fruit from the trays until it is thoroughly cured. This word of caution means the salvation of your business.

Mr. Richmond does not give the proportions of the lye solution. A solution which is possibly stronger than the one referred to is given in a former Cultivator as follows:

The strength of the lye solution depends on the ripeness or condition of the fruit and degree of heat. If the prunes are fully ripe or partially dried and the water is not boiling, some use as strong a solution as one pound of lye to ten gallons of water. When care is used to keep the water at boiling it may be used as weak as one pound to 50 gallons.

GRAPE STANDARDIZATION SERVICE

The following suggestions and regulations for grape packing and shipping have been adopted for use during the present season:

All grapes, both standard and sub-standard, for table, manufacturing, by-products or any other purpose, testing less than 17 per cent sugar content Balling scale shall not be shipped, with the exception of Emperor, Gros Colman and Cornichon, which shall show not less than 16 per cent sugar content, Balling scale. Inspections for sugar content will be made in so far as is practicable during the packing operations.

Grapes, which when packed either in lug, crate, drum or other container meet the requirements of the fresh fruit and vegetable standardization law approved May 27, 1919, shall be labeled in accordance with name of packer, shipper, grower, firm or organization which shall have first packed or authorized packing of the fruit; address of packer; name of variety if known, and if not known, the words "unknown variety"; minimum net weight; and if two or more varieties are packed in a container, the words "mixed varieties." In the case of lugs, "pack, packing or packed" shall mean the regular compact arrangement of the grape bunches with stems uniformly up or down.

No markings will be required on unpacked grapes which do not meet the requirements of the standardization law. Packers may mark such stock as they see fit, but inspectors will not permit the use of the words "Table Stock," "Extra Fancy," "Fancy," "Extra Choice," "Choice," "Standard," or any other grade terms which might be misleading.

Inspectors condemning packed grapes will require same to be dumped loose in lugs if designed for shipment, unless the shipper desires to recondition the stock in order to meet the requirements of the standardization law.

PINK FLESHED GRAPEFRUIT

F. G. Sheffer, horticulturist of Phoenix, now summering in Los Angeles, is a believer in Arizona grapefruit, more particularly of one particular kind of grapefruit, a pink fleshed, large growing variety. Hence, he has received from Diller & Sons, Arizona, packers of grapefruit, specimens of this pink fleshed, or what might be termed a blood variety, of grapefruit. The pink coloring is not shown so much in the flesh as in the skin. The flesh, however, is a most attractive shade, and we will have to confess the eating quality of the fruit is excellent.

RAISIN AUCTION

As the result of a public auction held in New York City, August 2, the Associated Raisin Company sold 150 cars of two and three crown loose Muscat raisins at average prices ranging from .2291 to .2361 cents per pound respectively. It is understood that the directors of the association will use these prices as a basis for fixing the prices for the 1920 crop.

WE BUY GREEK CURRANTS AGAIN

During war years imports of Greek currants were suspended; now American buyers are reported by the federal bureau of markets as taking large amounts of the foreign product. A total of 16,167,494 pounds were exported from Patras, Greece, to the United States between January 10 and March 9, 1920, as against 14,560,595 pounds for the entire 12 months of 1919.

The Miskin Scraper

IS

THE BEST SCRAPER ON EARTH

And we can prove it. Write for circulars

The above is a cut of the Famous Miskin Scraper, which in operation, easy draft, greater capacity, and better work has many advantages over the common Fresno and wheel scrapers now on the market.

Made in 2-horse, 3-horse and 4-horse sizes. The four horse size can be operated by small tractors from the tractor seat, by the tractor driver.

Send for descriptive circulars, with prices. We pay the freight.

Miskin Scraper Works, Ucon, Idaho

Get More Fruit, Better Fruit and Bigger Cover Crops

Insist on the fertilizer that will do its full duty in your citrus grove. Be sure to get

Bradley's Standard Fertilizers

"THE WORLD'S BEST BY EVERY TEST"

Bradley's fertilizers are quick-acting, high-grade and dependable. They help to set more fruit. They keep it growing and thus insure better size and quality. They grow the new wood necessary for the next crop. They increase the cover crop and thus add humus to the soil.

Value of Show Ring in Fostering Better Cattle

By R. R. Miller

THE visitor at the large cattle markets of the United States 20 to 30 years ago viewed a much different type of cattle than the visitor sees today at the same yards. Steers came to market then four to six years old and even older. They were larger, rougher and represented much more feed and labor than the present day type. A visit today will still show thousands and thousands of narrow, thin scrub heaves, yet the general type and conformation has been improved. These cattle are found to be for the most part yearlings, two's and three's. From the standpoint of breeder, feeder, packer and consumer the earlier maturing, easier feeding type has proven the most profitable and most satisfactory.

The breeder and feeder desire steers which will produce the greatest amount of high quality beef from the least feed in the shortest possible time. The younger type of cattle do not tie up the capital for half the time that was formerly thought necessary to produce a marketable beef, and a quicker turnover of the working capital is thus possible. Higher priced farm lands, feeds and labor have made these changes necessary. No doubt the transition would have taken place without the influence of our livestock fairs and shows, but I think all will agree that the changes have been brought about much more quickly than they would otherwise. It was at the shows that the stockmen first saw what could be done in feeding younger cattle. Of course the change was gradual, but in the contests at the shows some exhibitor would present for approval a superior single steer or carload lot equal to other steers on the ground in every respect, yet much younger. A novice could readily see the advantage of this in the production of beef, since the production in a shorter time meant less feed, less expense and a quicker return.

There is an old saying that seeing is believing, and to see one has to

attend the stock shows. The pride of every man in every business is to do his work better than his neighbor, and when he has accomplished this the natural thing to do is to show his neighbor what he has done and compete with him. The livestock shows furnish a medium for this competition, hence the most modern methods are exhibited and explained to the public. As a result the fairs and shows have become the school for the breeder and feeder. When the best judges in the country of the best cattle in the country made younger animals the champions and grand champions, breaking time honored precedents, it caused the cattlemen to think along different lines and created new ideas.

The livestock shows are the show windows of the cattlemen. In order to demonstrate to the farmer and cattleman the merits of their breed and their own cattle in particular, breeders of pure bred cattle exhibit animals representative of their herds. In the average stockman the view of these cattle arouses a desire to use better sires and improve their herds. It gives him an opportunity to study the types of cattle produced by the different breeders and thus know where he may purchase the class and type of bulls he desires when in the market for such stock.

The show is the university of the cattle business. Each class and show ring is a lesson to every breeder. There the opportunity is given to study carefully the various types produced by the different breeders, compare the cattle of the same ages, etc., bred by the several exhibitors. The visitor is enabled to judge by comparison the strong points and weaknesses of the cattle exhibited, determine the ideals he thinks best and hear the opinions of the best judges.

From standpoint of exhibitor and the person in the market for high class stock, the show provides a meeting place and an opportunity for immediate and future business.

Los Angeles Livestock Show

The third annual Los Angeles Livestock Show will be staged at the state exposition grounds, October 2 to 10.

Speaking of the proposed show, C. R. Thomas, secretary of the Livestock Association, with offices in the chamber of commerce building, says: "It is the aim of the directors to make this the greatest stock show ever held in the West and to see that every visitor returns home enthusiastically endorsing the exhibition. These shows are cooperative enterprises designed to stimulate breeders to better efforts and to enlighten the public to the full meaning conveyed by the words 'pure bred.' The directors hope exhibitors and people at large will meet them in the same spirit and with equal enthusiasm in their efforts to produce more and better livestock."

"An attractive program ranging in variety from hundreds of exhibits of all breeds of livestock, poultry and pure blooded animals to running races, horse shows and timely events will satisfy and interest the most exacting fancier and casual spectator."

Upon the receipt by exhibitors of premium lists mailed this week offering \$50,000 in prize money, a flood of entries is expected from all Middle Western and Western points.

Substantial prizes are provided for every department and classification of beef cattle, dairy cattle, saddle horses, draft horses, mules, ponies, swine, goats, sheep and poultry. Entries for livestock close September 5; entries for poultry close September 15.

The roster of judges selected includes three of the best livestock experts in the country. F. W. Van Natta of Fowler, Indiana, who has judged at large livestock shows in the United States and Argentine, and is highly endorsed by the American Shorthorn Breeders Association, as well as the Aberdeen-Angus people, will judge all beef cattle. Prof. H. H. Kildee of Ames, Iowa, recommended by associations all over the country, will judge dairy cattle and swine. Prof. E. A.

Trowbridge of the Missouri agricultural college, Columbia, will judge all horses.

The officers of the Livestock Show are E. W. Murphy, president; Clinton E. Miller, first vice-president; Harold H. Braly, second vice-president; Albert M. Paul, treasurer, and C. R. Thomas, secretary-manager. The directors are J. C. Adams, Fred H. Bixby, Harold Braly, George M. Brown, Harry Chandler, Edward A. Dickson, T. H. Dudley, R. L. English, Herman J. Hauser, Charles H. Hill, H. A. Jastro, R. H. Jeffries, F. E. Lewis, George Lichtenberger, Clinton E. Miller, E. W. Murphy, Albert M. Paul, Walter M. Ross, Frank Simpson, Walter P. Story, Frank Wiggins, H. B. Woodhill and H. H. Whitten.

SPRAY COWS TO KILL FLIES

The general discontent and unrest among dairy cows now is due to the extremely hot weather and the common stable fly. Darkened barns, well shaded pastures and stabling of the cows during the heat of the day will help solve the heat problem. The flies may be controlled largely by cleaning the stables daily and sprinkling the manure with lime and spraying the cows with a fly repellent solution, according to R. D. Canan of the dairy extension staff of Purdue University.

"It is best to spray twice a day, just after the morning milking and immediately before the evening," said Mr. Canan. "However, if this cannot be done it is advisable to use only the evening spray, which also may be applied with a brush or sponge."

Any of the prepared solutions on the market are more or less effective, but because of their expense it frequently is better to make a solution at home. Kerosene emulsion, one of the cheapest and most effective, may be made by dissolving a pound of yellow soap in a gallon of soft water heated to boiling point. To this add two gallons of kerosene in a barrel

so that the solution may be stirred vigorously. Dilute the mixture with six gallons of water. This solution will spray 100 cows. For fewer cows use less material in proportion to the number of animals.

Another good spray recommended is a mixture of 4½ quarts of coal tar dip, 4½ quarts of fish oil, 3 quarts of kerosene, 3 quarts of whale oil, 1½ quarts of oil of tar and 3 pounds of laundry soap. The soap should be dissolved in water. Add the ingredients and bring the whole up to 30 gallons with lukewarm soft water. This entire amount can be prepared at one time and held over from one spraying to another while the kerosene emulsion must be used as it is made.

COMBAT WORMS AND DISEASE

Keep hogs thriving—strong, healthy hogs resist cholera. Quarantine every hog dead from cholera; the law requires it. Lice, worms and insanitary conditions weaken hogs and invite cholera.

Disinfect hog yards occasionally with unslaked lime; it's good cholera insurance.

Serum and sanitation make the best preparation for the warfare against hog cholera.

Keep cholera hogs and carcasses away from the stream and insist that your neighbor do the same.

The straw shed for hogs is almost sure to be either damp or dusty. Either condition invites disease.

Keep gunny sacks saturated with crude oil where hogs can rub against them. Raise more hogs and fewer lice.

Kill lice with crude or fuel oil sprinkled on the hogs at feeding time, applied to rubbing posts or used as a two inch layer on top of the water in a dipping tank.

Cough and pneumonia from dusty beds may incidentally be prevented if louse infested beds are oiled. Breathing dust may cause death from pneumonia and certainly renders hogs less resistant to cholera.

The Missouri college of agriculture has carefully tested each of these remedies and so have thousands of good farmers. They have stood the test, but are not substitutes for serum treatment, for they resist but do not entirely prevent cholera. These thrift producing measures would pay if cholera did not exist.

Sprinkle freshly slaked lime about one-sixteenth of an inch deep over the lots, sprinkling quarters once every month or two. At this rate a barrel will kill the germs on about 1,280 square feet of lot space. Combat worms by feeding a mixture of 4 parts of charcoal, 3 parts of copperas, 3 parts of common salt, 3 parts of Glauber salts, 3 parts sal soda, 1 part sulphur. Mix in 100 pound lots and keep in a dry place where the hogs can help themselves. It is a good "conditioner" and has been thoroughly tested.

ADVISES CORN BELT FARMERS TO BUY WESTERN HORSES

Charles Irvine, president of the American Association of Importers and Breeders of Belgian Draft Horses, is of the opinion that never has there been so great a scarcity of foals and yearlings in proportion to the total horse population of the United States. Mr. Irvine, accompanied by William Crownover, recently drove 1,500 miles on a round trip through Iowa and Minnesota. They, as experienced horsemen, observed the horses passed en route. During their entire trip they saw but nine foals and estimated more than 1,000 mares at work or in pasture without colts at side.

"The public generally doesn't realize the great scarcity of good horses," said Mr. Irvine. "Every effort must be made to increase production. I look for heavy breeding next year, but it will be four years before such stock can be put into the collar. Our only hope for an immediate supply is to purchase good young Western horses. Such horses, carrying three or four crosses of draft blood, will, if matured in the Corn Belt, develop to draft size. Their purchase will permit farmers to sell their mature, hardened horses, suitable for city use, before depreciation sets in, and realize a profit on the Western stock which they feed out to better maturity and weight while doing farm work."

A. P. Coon, Western representative for the Horse Association of America, confirms Mr. Irvine's report but adds that in some communities the farmers recognize the situation and are breeding two and three times as many mares as they did last year.

ADVANTAGE OF THE SILO

"There are many advantages in the use of the silo, but the principal one is that it provides the cheapest, easiest and most profitable means of storing a succulent feed for winter use," according to S. P. Clark, extension agronomist of the University of Arizona.

"It is also a means whereby a farmer can increase the number of cattle or sheep that he can carry on the farm. It usually takes the crop produced on an acre to feed a 1,000 pound animal through the winter. The same amount of land planted to corn or sorghum and stored in the silo will feed three animals for the same length of time, so that three times as many head of livestock may be kept on the farm if the fields are planted to silage crops rather than kept in pasture.

"There are a great many localities in Arizona, both under irrigation and dry farming, where farmers could spend the summer months in growing

a large amount of silage crops. In the fall they could buy the old cows or cheap canner stuff from the large cattle outfits, feed them silage for a few months and then turn them at a good profit.

"Owing to the nature and feeding value of silage, cheap or practically useless forage may be used to good advantage. Especially is this true where there is a large amount of straw to be utilized. An animal will consume much more straw when it is fed along with silage than when fed a ration of straw alone."

CREATING NEW MARKETS

The Dairyman's Problem

THE successful business takes advantage of every market presented for its products. Utilizing the formerly wasted by-products of manufacturing processes has invariably benefited both the producer and the consumer.

Three fundamental principles of business practice which have stood the test of long experience are—

Eliminate waste by utilizing the entire product.

Always seek new outlets for the product.

Create for every by-product a legitimate market.

Now how can these business principles be applied to dairying?

Government reports show that about 41 per cent. of the total production of milk in this country—or about thirty-four and one-half billion pounds—is devoted to butter-making. Of this amount only about four per cent., or three and one-third billion pounds, actually becomes butter. The balance—about thirty-one and one-third billion pounds—goes back to the dairyman as skimmed milk for which some other use must be found. There are no statistics to indicate what becomes of all the skimmed milk, but government figures show that only about two per cent. of this valuable food finds its way into the human dietary.

The Dairy Division of the Department of Agriculture, in a recent bulletin, says about skimmed milk:

"In the past, much skimmed milk has

been wasted, both by throwing it away and by feeding it to live-stock, when it could have been used to better advantage as human food. This does not mean that no skimmed milk should be fed to calves, hogs and chickens. Such a conclusion would be ridiculous, because our markets are not ready to absorb all of the skimmed milk produced, but human needs should be cared for first, and only the surplus skimmed milk should be fed to live-stock. Such a procedure is logical and is based upon economic grounds."

It is apparent that the dairyman is not putting all of his product to its most profitable use.

And this is due largely to the fact that because lacking a fat content skimmed milk does not appeal to the taste.

It is necessary, therefore, to find for skimmed milk a human use, and so improve the product that it will be best suited for that use.

By the addition of a fat, wholesome and nutritious, skimmed milk can be made very desirable for use in cooking and baking.

This fact is what first suggested HEBE, a product consisting of pure skimmed milk enriched with coconut fat. HEBE is the first real effort to develop a broad commercial outlet for skimmed milk as human food. It sells to a multitude of housewives who would not otherwise use milk for cooking at all, and thus it increases the general consumption of dairy products.

HEBE BENEFITS ENTIRE DAIRY INDUSTRY

Then the question arises—How will HEBE benefit the dairyman who is not near enough to a HEBE condensery to send his milk there? The answer is that while the HEBE industry is young and HEBE plants few in number, yet every can of HEBE sold is helping to develop this new market, and every bit of advertising put out by The Hebe Company is helping to educate the public to a greater use of dairy products. The ice-cream industry is a parallel case. Although many dairymen are not within shipping distance of an ice-cream factory, yet every milk producer is benefited by the increased demand caused by the use of nearly four billion pounds of milk

yearly by the ice-cream manufacturers.

HEBE is not intended to replace milk for direct feeding purposes. It is offered as an auxiliary to the family milk supply, for use in cooking and baking. It is honestly labeled as to contents and uses, and is advertised extensively.

Thus HEBE becomes an important factor in the solution of the dairyman's problem—"creating new markets." As an ally to the dairying industry it seeks to make for itself a new market, without interfering with other established markets, and in doing so it increases the general use of dairy products to the profit of the entire dairying industry.

You will be interested in reading our booklet, "The Missing Third." Ask us to send you a copy. There is no charge for this. Address 2873 Consumers Bldg., Chicago.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins
August 26, W. M. Bray, Sacramento.
September 23, Allana Farms, Dixon.

Herefords
November 4, Pacific Coast Hereford Breeders' Association, Sacramento.
November 5, J. H. Cazler & Sons, Sacramento.
November 6, H. M. Barngrover, Sacramento.

Shorthorns
September 30, Wilotta Ranch, Suisun.

Poland Chinas
August 21, Merced County Poland China Breeders' Association, Merced.
September 27, Hugh C. Shinn, A. J. Elliott and Alex D. McCarty, Tulare.
October 6, Kings Co. Poland China Breeders Assoc., Hanford.

Berkshires
August 14, Southwestern Berkshire Congress, D. J. Bastanchury Ranch, La Habra.

Reference was recently made to the purchase by the Finell Stock Farm Company, Galt, of the entire Kiesel herd of registered Herefords. In the purchase were included approximately 180 head. The new owners are not in a position to handle such a large herd and they plan to retain only about 35 head of breeding females. Most of the balance will be offered at public sale on a date to be announced later.

At the last meeting of the California Duroc-Jersey Breeders Association the

resignation of S. E. Whiting of Sacramento from the secretaryship was accepted. J. P. Walker of Visalia was elected to fill the vacancy. It was also decided to secure the services of a field man and steps are being taken to finance the new plan.

C. L. Hughes of the California Breeders Sales and Pedigree Company, Sacramento, has announced that on Thursday, September 30, he will sell the entire herd of registered Shorthorns owned by William Pierce, Suisun. This sale will mark the passing of one of the oldest established herds in California and is made neces-

sary through the plans of Mr. Pierce to extend his orchard interests. The sale will be held at the beautiful Wilotta Ranch near Suisun and will consist of around 75 females and 30 young bulls.

Considerable interest is being manifested over the forthcoming dispersal of the W. M. Bray herd of Holsteins, owing to the fact that the herd bull, Colony Zarilda Newman, is a son of Zarilda Clothilde 3d De Kol, the only cow in the world, aside from Tilly Alcartra, that has produced over 33,000 pounds of milk in a year. Forty-seven high class females are included in

A BARN BUILT OF DOORS

One of the barns at the Butte City Ranch, Butte City, is built entirely of doors. It was this barn that furnished the idea for the story, "The Farm With a Thousand Doors," by Freeman Tilden, and published in a recent issue of The Country Gentleman. This barn was but one of the many interesting features to be seen at Butte City Ranch during the annual sale, August 11.

the offering that will be sold at Sacramento, August 26.

An illustrated bulletin on "The Production of Good Milk and Cream," by C. F. Hoyt of the division of animal industry, recently went to press and will be issued within the coming three weeks.

M. Bassett and Sons, Hanford, will add a great deal to the strength of the Poland China division of the state fair next month. In addition to their regular showing of breeding stock, they will exhibit two carloads of fat barrows and also show in the other barrow classes, exhibiting about 100 head in all.

A. E. Harvey of Fairbanks Ranch, Redlands, reports the very recent sale of seven Hampshire fall gilts to Mr. Gibson at San Jacinto. These gilts are all daughters of the grand champion boar Harvey's Choice. Two are out of Calla of The Harvester blood lines, two others out of Josephine and another from Maid of Redlands. All are bred to the young boar Chong.

H. L. Graham of the Eastman Ranch, San Fernando, is busy putting the finish on the good junior yearling Buster Bob. This young boar is one of the largest framed boars of his age in the state and will furnish some very strong competition.

C. C. Ellis of Exeter mixed with the boys at the recent public sales of Durocs in the South, taking occasion to add a few things of merit to the home herd. From the Winsor Ranch sale Mr. Ellis secured the junior yearling daughter of Orion Sensation, Great Miss, and out of a Pathfinder dam, bred for a Winsor's Giant Orion litter, and also a yearling daughter of Pathfinder, Miss Minnie 3rd, carrying service to Great Sensation 3d. The boar now in service in the Ellis herd is Fannie's Orion King. Two of the leading sows in the Ellis herd are daughters of Freddie You'll Do and Critic B., the latter winning in class, and made grand champion at the local fairs. She has a fine futurity litter to be heard from this year.

Arrangements are being made to have all the boys and girls in the Stanislaus County calf club exhibit their calves at the state fair. This should attract quite a little attention as this is one of the best clubs in the state and has as high class calves as could be purchased. In fact, the average cost of the calves in this club was \$318, one of the highest priced lots ever used in the club work.

BUTTER, CHEESE AND ICE CREAM MAKERS ASSOCIATION

The membership of the California Butter, Cheese and Ice Cream Makers Association has increased from 12 to 50 since its formation, October, 1917. Considering the number of men engaged in dairy products manufacture in the state, we can readily conclude that the organization is making progress from the membership point of view. The status of our members among the creamery operators is further assurance that the organization is developing successfully.

The need of good men in the dairy plants has been felt for a long time, and that is mainly why the California Butter, Cheese and Ice Cream Makers Association is being developed. Possibly at some time we may become affiliated in a national group with other associations and thus promote our work on a larger scale.—J. C. Marquardt, Secretary-Treasurer.

SALE OF MILK GOATS

Dr. Burton C. Platt is introducing to the milk goat people the auction plan. He will offer at public auction high class Nubian milk goats and registered big type Poland China swine on Saturday, August 21, at his place near Eagle Rock Park. There will be on exhibition Nubian does noted for milk production, and some of the progeny of these does will go under the hammer. Some of the does to be offered are of same blood lines as Holly Lodge Shingle, at head of the Bonanza herd of 200. The Poland China young boars and gilts are of big type blood and show yard character.

A Sale of World's Record Blood

COLONY ZARILDA NEWMAN—By a son of Margie Newman and out of Zarilda Clothilde 3d De Kol, 33,153.6 lbs. milk and 1194.17 lbs. butter in one year.

LADY CORNUCOPIA MERCEDES—31.60 lbs. butter from 740.5 lbs. milk in 7 days at 4 yrs. She is by a son of Margie Newman.

A COMPLETE DISPERSAL

of the High Class Herd Owned by Wm. M. Bray, Klamath Falls, Ore.

State Fair Grounds, Sacramento, Cal.

Thursday, August 26

at 10 A.M.

50 Registered Holsteins 50

This is a herd of unusually good type, size, and production, backed by some of the world's record blood of the breed. All animals over six months old have passed two Federal tuberculin tests without a reactor. There has never been a case of abortion in the herd.

There are 47 females in the sale, only two of which are over 4 years old. They include a considerable number of granddaughters of the former world's record milk cow, Margie Newman, also granddaughters of King of the Pontiacs, Sir Ormsby Burke Segis, King Korndyke Sadie Vale, and other famous breeding and producing animals.

LADY CORNUCOPIA MERCEDES (cut shown above) will be sold, and note that she milked 740 lbs. in 7 days as a junior 4 year old, and made over 31 lbs. butter in 7 days. She is a beautiful individual and a real cow. She also has a beautiful helper calf in the sale. She is a 75% sister to Nena Newman Cornucopia, sold in the St. Paul National Sale for \$4100.

DAUGHTERS OF COLONY ZARILDA NEWMAN, the great herd sire pictured above.

DAUGHTERS OF KING MECHTHILDE NEWMAN, who is by a son of the former world's record milk cow Margie Newman, and is out of the 30 lb. \$4100 cow Nena Newman Cornucopia. One of these is out of a 31.96 lb. junior 4 year old that milked 602 lbs. in 7 days.

DAUGHTERS OF DUKE MECHTHILDE NEWMAN, son of Margie Newman.

DAUGHTERS OF ONONIS CORNUCOPIA JOHANNA LAD, a son of Margie Newman and sired by a son of Colantha Johanna Lad.

DAUGHTERS OF SIR COLANTHA PRILLY, who is by a son of Colantha Johanna Lad and out of a granddaughter of the great foundation cow Prilly.

DAUGHTERS OF A 32.57 POUND BULL whose sire is a full brother to King Korndyke Pontiac, sire of the \$12,000 King Korndyke Pontiac 20th, and grandsire of the \$41,000 King Korndyke Pontiac Acme.

DAUGHTERS OF A SIRE whose dam made 924 lbs. butter from over 22,000 lbs. milk in one year.

DAUGHTERS OF A SON OF MUTUAL FOBES LONGFIELD DE KOL and a 29 lb. cow whose sire is a full brother to Pietertje Maid Ormsby.

A GRANDDAUGHTER OF KING OF THE PONTIACS out of a 20 lb. daughter of Sir Ormsby Burke Segis, sire of Ormsby Segis Marie, who made a world's record for milk production as a 3 year old and made over 30,000 lbs. in one year as a 5 year old.

COLONY ZARILDA NEWMAN

When this bull enters the sale ring he will be the second son of a 33,000 pound cow ever offered, the other one being the son of Tilly Alcartra, sold at St. Paul. He is not only a son of Zarilda Clothilde 3d De Kol, the only cow except Tilly Alcartra to make over 33,000 lbs. milk in one year, but he is sired by the best proven son of Margie Newman, former world's record milk cow. He is just past 5 years old, is a splendid individual, a quick, sure breeder, and a real herd sire for someone with a high class herd.

It Will Be A Sale of Bargains

The owner of this herd, Mr. Wm. M. Bray, had planned to develop a very extensive breeding and dairy farm at Klamath Falls, in fact materials for the new buildings had already been delivered to his ranch, when a turn in his extensive lumber interests demanded his presence for a considerable time in another section of the country. It thus became necessary to dispose of his herd of Holsteins quickly, regardless of the fact that the season of the year, and the hurried preparations for sale are bound to result in lower prices than the real merit of the offering warrants.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL OVER SIX MONTHS OLD TUBERCULIN TESTED AND SOLD SUBJECT TO RETEST BY THE BUYER.

Catalog free on request. Write for one.

Simplex Silos are Scientifically Correct

How Do You Decide

¶ ¶ *The Science of Psychology Reveals Some Interesting Facts* ¶ ¶

An act of decision consists of selecting one of two or more diverse things. The science of psychology explains that everyone decides by one of the five following methods:

1. By comparing each thing point for point and selecting the one with the greatest number of advantages.
2. By forcing the selection without making a comparison.
3. By selecting the thing that appeals to the emotion regardless of its advantages.
4. By leaving the selection to chance.
5. By acting upon advice.

No matter how you make decisions in your daily life, we want you to select your ensilage cutter by the first method. Note the solid semi-steel frame of the Papec—its perfect knife clearance—the minimum power upon which it operates (as low as 4 H. P.)—the six fans on the cutting wheel instead of three or four—its ability to cut from 3 to 10 tons of ensilage per hour and elevate it to the height of any silo at 600 R. P. M. without clogging the pipe.

Note these points. Find out more about the Papec by mailing the coupon. Get all the information you can on other cutters. Then compare the Papec feature for feature with other cutters, and select the one with the greatest number of advantages.

This is the fairest test we know. It has always resulted in a Papec sale. We, therefore, suggest it, confident you will decide upon a Papec.

Make this test at our exhibit at the California State Fair, Sacramento, September 4th to 12th.

RIVERINA FARMS

MODESTO, CAL.

Do You Know?

That The Westerner is a half brother to the sire of Caldwell's Big Bob, Grand Champion at the National Swine Show in 1917.

The Westerner heads a herd of sows that have no superior on the western coast.

Remember our big public sale Sept. 27th. It will be an event in Poland China circles.

Lendorris Liberty Bond, Skyrocket and Lendorris Liberator

Three good sons of three good sires are our herd boars. We will have a few representatives of our herd on exhibit at the state fair. When in need of choice Poland China breeding stock, write for our prices. You will find them very reasonable.

W. L. Haag and Son

Hanford, Cal.

THE SEQUOIAN

A yearling Poland China boar of strictly big type breeding that carries the size, stretch and quality so much desired by the breeder and feeder.

Write for prices and information on most anything in the way of breeding stock.

Z. M. Dickey

Dinuba, Cal.

McCune's Quality Herd

of BIG TYPE POLAND CHINAS

The home of Edith Rose, King's Massive Orange and many other noted individuals. A McCune bred Poland China is backed by many generations of the best breeding.

H. D. McCUNE,

Lemoore, Calif.

King's Big Bone Leader

A Grand Champion, and Giant Bob 2nd, a son of last year's Grand Champion, are my herd boars. They are siring a high class of Poland Chinas. Write for prices and information.

Les McCracken

Ripon, Cal.

Trewhitt's Big Type Polands

Are the result of careful mating and selection. Size and feeding quality have always been essential features in this herd. Write for prices and information. I can interest you.

W. D. Trewhitt

Hanford, Cal.

For easy feeding, early maturing Poland Chinas,

The Get of Model Big Fellow

The Reserve Grand Champion of the last state fair, the strongest Poland show ever held in the state, are the kind to buy. Your correspondence solicited.

J. F. McSwain

Merced, Cal.

The Forrestview Herd of Polands

I am now located on my new place near Chico, where I am better prepared than ever to care for my customers. My intention is to raise more and better Poland Chinas in the future.

J. H. Cook

Route 4, Chico, Cal.

Johnson's Defender Jr.

Heads my herd of carefully selected sows. He should be seen to be appreciated. I can spare a few choice females or young stock either sired by or mated to this good boar. You will be pleased with any purchase made from me.

Visalia, Cal.

Value of Showing Livestock

"Undoubtedly showing livestock at the county fair and later at the state fair is the best possible eye opener for the young breeder who hopes eventually to breed high class registered livestock," says C. M. Hubbard of the Washington state college. "Exhibiting stock helps him in many ways to see where the animals he exhibits are weak and wherein they are strong. Perhaps he has not placed enough emphasis on bone, size, scale in his beef cattle breeding; or possibly he has not realized that the fleece of the ram he is using has a liberal content of black fibers and that all the lambs he is siring are stamped with the same defect; or it may be breed type wherein his stock is weak. If the amateur exhibitor is not prejudiced in favor of his own stock, if he has the gift of being able to 'see his stock as others see it' he will soon be making the veterans hustle for their share of the trade in breeding stock and of prizes in the show ring.

"Too often the young breeder does not furnish his young stock with sufficient pasture, sufficient feed to grow them out properly. He is afraid of the feed pail and if the summer is drier than usual his stock loses in weight and condition when it should be gaining. When this man takes his exhibit to the fair he immediately notices that the animals his stock competes with are very much the larger, deeper bodied and better proportioned. He goes home with the third and fourth ribbons if there are that many places. If this young breeder has good red blood in his veins he will grit his teeth and say to himself: 'Wait until next year', and the following year will find his entries well up in the money. If he has not made the discovery that a good proportion of breeding may be put down the throats of his stock in the form of feed his entries will be at the foot of the class where they were the year before. In the latter case you will hear him telling the fair visitors that 'feed was mighty scarce—did not have any rain since the middle of June—did not have time to fit them,' etc. There is no hope for this type of stockman in the purebred livestock game in breeding and developing superior seed stock. If nature does provide sufficient pasture the successful livestock breeder finds that it is frequently necessary to feed a supplemental ration; if nature does not do her part he finds that it is necessary to feed more.

"The livestock show often causes the showman to realize that he is using too ordinary a sire. He finds that if he expects to breed as good stock as the other fellow that his sire must possess better breed type, must be masculine, and possess style and carriage as well as correct conformation and good size for the breed. In other words he realizes that 'something can not be taken from nothing', that good stock can not be developed from mediocre blood, and he invests the necessary dollars in a real herd or flock header.

"General care and management will be given more consideration after his first show yard experience. If he is breeding swine he will have discovered that if they are to win they must stand up on their toes, and that in order to stand up on their toes their feet must be trimmed from time to time, and that exercise is absolutely essential to the development of strong pasterns; if it is sheep he makes the remarkable discovery that the judge, after extricating the briars and thistles from his fingers, does not come back to his sheep for more. In other words, from show yard experience, from talking with older exhibitors, and in observing the type of animals which win and how they are fitted, he soon comes to the conclusion that better blood, proper feeds (also feeding methods), and good care and management are the limiting factors behind the show yard winners.

"Often the young breeder has better stock than he realizes, stock which is good enough to stand well up in the money if he can be induced to exhibit them in their best clothes. The beginner should never be afraid of being beaten as, often enough, a good sound beating is the best thing which could happen to him if he takes it in the

right spirit and has the 'come back' spirit.

"Showing livestock at the fairs is a splendid method of placing the herd before the public through the farm and livestock papers. Winning prizes gives the breeder a reputation, and, if he is raising a breed for which there is a good demand he soon discovers that he can sell his surplus stock at higher figures than he could before he entered the show ring.

"Advertise the herd or flock in the farm papers, stating the fairs where the herd will be exhibited. Remember that publicity sells the surplus stock and lack of it causes the breeder to carry extra bulls, boars and rams through the coming winter or else sell them for only a fraction of what they are really worth.

"Last, but not least, the amateur showman learns that it pays to be a game sport in the show yard. Winning, he does not 'crow' over it, and losing, he does not run down the other man's stock and accuse the judge of being crooked. He grins and bears defeat even if it is hard work to wrinkle up his face—and he is not a quitter. The world has no use for the latter type."

SUGGEST SYSTEM FOR MAKING PORK PRODUCTION PROFITABLE

The farmer who provides pasture for his hogs whenever possible is the one who makes the production of pork most profitable, says the United States department of agriculture in Farmers' Bulletin 951, "Hog Pastures for the Southern States." In epitome, the advice given in the bulletin is:

Green herbage is essential to the economical production of pork.

A permanent pasture supplemented with quick growing, heavy yielding, temporary forage crops is most satisfactory.

Alfalfa, where it can be grown, is undoubtedly the best forage crop for hogs.

On an average one acre of permanent pasture should be kept for each brood sow.

Some of the heavy yielding, quick growing forage crops will add much feed to the quantity produced by a permanent pasture.

There should be mature crops, such as corn, soy beans, peanuts, or velvet beans, for finishing the hogs in the fall. Oats, rye and wheat give satisfactory winter grazing.

Green forage alone is little better than a maintenance ration. If rapid gains are desired, the hogs should have a liberal allowance of grain. The rule should be "All the grain they will eat without waste."

Growing forage crops and "grazing them off" on the land is an efficient method of improving soils depleted in organic matter.

The exercise obtained in grazing exerts a beneficial influence on the health of hogs.

The various forage crops for hogs, each discussed in detail, are corn, sorghum, winter grains, alfalfa, black medic and hop clover, red clover, crimson clover, soy beans, velvet beans, cowpeas, peanuts, chufas, sweet potatoes, mangels and rape.

Suggested cropping systems are given, but the statement is made that it is impossible to plan a succession of crops that will be satisfactory for any large number of farms and that each farmer must plan his own system according to his conditions of climate, fertility and layout of fields.

EASTERN HORSE DEALERS BEHIND ON ORDERS

Increased production of good horses is the great need at present. Fiss, Doerr & Carroll Horse Company, New York, one of the largest firms dealing in horses in the East, states that it has sold more draft horses for city use in the first six months of 1920 than in any other similar period for many years, and could have disposed of many more had the supply been available. A. M. Ernst, general manager of the company, when interviewed on Friday, July 16, said of the situation in the East:

"We have enjoyed an unusually good trade this year. City users of trans-

Facts in BLACK & WHITE

The Dairy Division at Washington Says:

"As the production of a cow is doubled profits increase three times. As production is trebled profits increase six times."

"The average cow in the United States yields 1823 quarts of milk yielding 207 pounds of butter a year. Average profit per cow \$20 over cost of feed."

The average production of all purebred Holsteins that have been officially tested for a year is 629 pounds of butter from more than 70000 quarts of milk.

In yielding more than three times as much as the scrub cow, the purebred Holstein yields six times the profits.

As production is tripled profits increase six times.

portation are swinging back to big
draft horses as the cheapest, most re-
liable and most efficient motive power
for all heavy transportation within the
working radius of a horse, despite the
increase in the cost of feed, which has
been formidable during the last year.

"City users are also coming to real-
ize that for all hauls, no matter what
distance, where frequent stops are in-
volved, as in delivering groceries, ice,
milk or other supplies furnished to
customers on regular routes, horses
are practical economical power. The
trade is gaining. Our great problem
today is to supply that trade. Good
horses are becoming increasingly
scarce and prices higher than we have
ever known. Heavy draft teams have
been bringing from \$800 to \$1,200 per
pair, but if they go much higher the
balance of favor will be liable to swing
over to motor trucks. There is a good
profit to farmers in raising draft geld-
ings to bring \$325 to \$400 on the farm,
yet we cannot get enough of that
type."

HOW GREAT HOLSTEINS ARE PRODUCED

Tilly Alcartra, the most talked of
cow in the world, whose last calf sold
for \$50,000 at the St. Paul National
Guaranty Sale, has been bred to Sir
Pietertje Ormsby Mercedes 43d, senior
herd sire of Toyon Farm Association.

Tilly's production for her first five
lactations is 4,819.11 pounds of butter
from 123,351.1 pounds of milk. For
seven years her production is 7,076.51
pounds of butter from 180,460.2 pounds
of milk. Aaggie Wayne Peep, the
dam of Sir Pietertje Ormsby Merce-
des 43d, for her first five lactations
produced 4,992.02 pounds of butter
from 110,706.5 pounds of milk. The
choice of Sir Pietertje Ormsby Merce-
des 43d will thus give the coming
calf for its two nearest dams the
world's two greatest lifetime pro-
ducers.

Miss Valley Mead De Kol Walker,
who holds the world's record in the
eight months after calving division as
a junior three year old, is also to be
bred to Sir Pietertje Ormsby Merce-
des 43d and accompanied Tilly on
her journey. She is the dam of the
\$12,000 bull, King Korndyke Pontiac
20th, and granddam of King Korndyke
Acme, the bull which recently sold
for \$41,000 at the National Guaranty
Sale at St. Paul.

VALUE OF A PURE BRED BULL

In a recent address to an assem-
blage of cattlemen, Thos. E. Wilson,
Chicago packer, cited a practical dem-
onstration of the value of pure bred
bulls in the production of market beef.

He stated that a few years ago 90
pure bred Hereford bulls were pur-
chased in the United States by a large
Brazilian cattle company and exported
to that country, and that a short
time ago the progeny of these bulls
were marketed in England along with
some native cattle of the same age
and raised under the same conditions.
The cross resulting from the use of
Hereford bulls on the native cows
brought two cents per pound more on
the English market than the native
cattle, the difference amounting to \$12
per head. Granting that each bull
sired 40 calves each year, the increase
on the value of their calves would be
\$480. The price paid for the bulls was
not stated, but the first crop of calves
should have paid for the bulls and the
additional value in succeeding crops
sired by those bulls would be clear
profit. What has been demonstrated
in Brazil is being demonstrated in our
own country every day, yet we find
thousands of scrub sires being used all
over the United States.

PIGS AND MUDHOLES

The mudholes common in many
barnyards are the sources of much
trouble to pigs. Sore mouth, eczema
and other skin diseases result from
wallowing in filth. And then when
the wallows dry up and become dusty
the dust helps to spread lung worms
and predisposes the animals to coughs,
colds and bronchial affections.

Germs of all kinds thrive in filth,
and there is no better place for them
to develop than in the insanitary barn
lot where the leachings from the ma-
nure heap provide a wallow for the
pigs. Clean barnyards and hog lots
will mean better health in the swine
herd. Farmers should have fewer
mudholes and more pigs. The latter
are more profitable.—Indiana Farmer.

Diamond Bar Durocs

Double Your Dollars

ACE OF PATHFINDERS

This great boar headed the World's Grand Champion Duroc herd at the
1919 National Swine Show; also the first prize get of sire herd. All animals
in both herds are owned by us.

He was Grand Champion at the Los Angeles Livestock Show and stood
second to the world's grand champion at the National.

He is by Pathfinder, out of Hiawatha, by Crimson Prince, and, besides
his show ring record, he is considered one of the greatest sires of the breed.

Buy These Breed Improvers

Now that we have decided not to hold a summer sale, we are ready
to offer at private sale the greatest array of Duroc breeding and indi-
viduality ever put before California buyers. We have culled closer
than ever this season, and every animal not fully up to the high
Diamond Bar standard has been sent to the fattening pen. And those
that remain—say, man, they are real ones!

SENSATION STRAIN BOARS AT SPECIAL PRICES

We have four or five January
yearling boars of the Sensation
strain ready for service which
we are offering at especially at-
tractive prices.

No matter whether you want a foundation
herd, new blood for an established herd, or
simply a boar to breed up a grade herd, we can
satisfy you from the world's largest Duroc herd.
While quality is high, our prices are reasonable,
and every animal is sold under a guarantee of
complete satisfaction. Call or write.

BETTER STATE FAIR

(Continued from Page 179.)

each county to play a part. Not all have reserved space, but at least 30, from San Diego to Shasta, are installing exhibits, and the unusually generous prize list is stimulating the keenest competition. These exhibits will be housed in the main building. It is quite certain that these exhibits alone are worth a trip to the fair—certainly one will know a lot more about this wonderful state after a trip through the displays.

Farmers interested in power machinery of any kind will find much to interest and instruct in the "Power on the Farm" department. This section will occupy an eight acre tract covered with the largest tents made and

will contain everything manufactured in the way of power machinery.

It is the intention of the officials to make this one of the most useful departments of the big fair, and they have placed it in charge of Professor L. J. Fletcher, instructor of the engineering and operating courses at Davis. Professor Fletcher will be assisted by a corps of competent assistants and will test and demonstrate every piece of machinery exhibited.

The display of agricultural products promises to be equal to that of any former year, despite the fact that the present season has not been entirely favorable. The University of California will again participate in a large way. The university exhibits will be found in the university building in the south end of the grounds.

The fair management is especially enthusiastic over the prospects for a notable livestock show. Livestock must essentially dominate any fair and during the last five years the development of the livestock division at Sacramento has been outstanding. Last year, despite such a handicap as the railroad strike, a new record

was made in both numbers and quality. This year the early entries total more than the finals of 1919. This fact is remarkable under present conditions, but can be explained by the large number of breeders who entered the pure bred ranks last year.

The beef cattle division shows the most important increase and is a fair measure by which to gauge the growth of that business during the past year. Last year five Shorthorn herds were in competition; this year twice as many herds will enter with more than twice as many entries.

Blackhawk Ranch, Diablo, will make its debut with Shorthorns, and the following older herds will be on hand: Estate of Thos. B. Dibblee, Lompoc; Thornton S. Glide, Davis; William Bond, Newark; Ormondale Ranch, Redwood City; H. L. & E. L. Murphy, Perkins; Pacheco Cattle Company, Hollister, and W. M. Carruthers, Live Oak. In addition to the above, it is known that other herds plan to exhibit.

It will be remembered that Little Sweetheart, the sensational 1919 international grand champion, owned by T. S. Glide, was uncovered at Sacramento. Visitors will have an opportunity to see her again this year.

The Hereford division shows an even greater increase over former years. Seven breeders have entered over 100 head. Romie C. Jacks of Monterey, who assembled a herd last fall, will make his first show, and it is probable that the grand champion female at the 1919 Denver show will be in his herd. J. H. Cazier & Sons of Wells, Nevada, will head their herd with Beau Blanchard 76th, the highest priced Hereford bull owned in the West. Other exhibitors include H. M. Barngrover, Santa Clara; John A. Bunting, Mission San Jose; H. H. Gable, Esparto; Chas. Rule, Duncan's Mills; D. H. Ogden, Alpine, and G. W. Emmons, Danville. This will be Ogden's first showing at Sacramento. Emmons will show Polled Herefords. The Hereford and Shorthorn classes will be judged by Dr. C. M. McCampbell of the Kansas state agricultural college.

According to Secretary Paine there will be a fair entry list in the single fat classes and also in the carload classes.

The dairy cattle classes promise to be up to other years, which is another way of saying the show at Sacramento will be the equal of any show in the country in point of quality. Several of the "old timers" will be missed, but the entry list discloses an unusual number of new names.

As usual, the Holstein division shows the heaviest entries, almost twice as many breeders exhibiting as in 1919. It is known that the quality will be high. Special interest attaches to the exhibit from Santa Anita Ranch. Santa Anita, for the reason that King Korndyke Pontiac Acme, the young bull that Mrs. Baldwin recently purchased from A. W. Morris & Sons, Woodland, for \$41,000, the highest price paid for a bull of any breed owned in California, has been entered. Other Holstein entries include: Dan Beeman, Woodland; Bridgford Holstein Company, Patterson; R. C. Gruhlke, Dixon; Anderson & Fogarty, Sacramento; Del Paso Heights Stock and Swine Breeders Association; H. E. Cornwell, Modesto; Fred Cornwell, Modesto; Linnie Cornwell, Modesto; M. Azivedo, Patterson; Six Brothers Dairy, Turlock; George Jr. Republic, Chico; E. D. Barry, Daggett; J. P. Phillips, Dixon; Geo. M. York, Modesto; Everett W. Fox, Modesto; Wilhelmina Fox, Modesto, and Jane Garden Farms, Sacramento. John L. Smith of Spokane, Washington, will judge Holsteins.

The Jersey show will have a heavier entry list than last year, about 80 head being entered. Nearly all the well known herds of the state will be represented and several new breeders are planning to make their initial show. Those who have entered are: J. E. Thorp, Lockford; Guy H. Miller, Modesto; J. B. Thorp, Lockford; M. Fortini, Orland; S. F. Williams, Chico; J. H. Sawyer, Galt; H. V. Traynham, Davis; C. E. Barrows, Orland, and B. A. Rider, Orland.

Three new Guernsey herds will be at the state fair to contest with the old established herd of A. B. Humphrey of Escalon; Hollow Hill Farm, Colton; J. Francis O'Connor, Santa

(Continued on Page 203.)

BIG BONANZA GOATRY SALE

To Be Conducted by Rhoades & Rhoades

Holly Lodge Shingle
(Nubian)

Bred by the late Baroness Burdett Coutts of Holly Lodge, England. "Holly" is the great progenitor of the breed in America. He heads Bonanza Goatry herd.

Third Annual Sale Dairy Goats Saturday, August 21st, 10.00 A.M.

BONANZA GOATRY offers a selection of high-grade Nubian does and bucks from its herd of 200. This is the largest herd of Nubians in America. It is headed by Holly Lodge Shingle, the unequaled producer of milkers of the sweetest and richest milk known. "Holly's" daughters in twenty States and in Canada have earned for their owners from \$260 to \$350 a season from sales of milk at 30 cents a quart. Does of the same blood lines will be sold. Stud fee of "Holly," \$25.00.

SWINE—Boars and glits from the three Poland Chinas on which I was awarded a first, second, two champions and grand champion premiums, 1919. See Barley Boy 2nd, you will get an eye full. His service fee is \$25.00. Bonanza Model, a youngster destined to win a national championship. Fee for this season, \$15.00.

BELGIAN HARES—Bucks and does of this, the classiest and cheapest meat producers known the world over. I have the true English Rufus Red—their equal rarely seen on this continent.

SORGHUM SYRUP PLANT—It is nearly new, used but a month. Capacity 300 gallons per day.

HORSES—A good ranch team.

WAGONS—Light spring, medium and heavy ranch type.

PLOW—3-shear orchard, mower, etc.

AUTO—Ford Runabout. Every internal piece new last April. A wonderfully efficient machine. Timken roller bearings in all wheels, forced oiling system, Zenith carburetor.

GOAT MANURE—One hundred and fifty tons, half rotted. The best lawn and farm crop plant food known.

LOCATION—On Eagle Rock Ave., near entrance to Eagle Rock Park. Garvanza car to end of line, walk two blocks.

At 9 A. M. the herd will be displayed in groups and photographed. Come early to see a goat show. Two of the best Nubian does on this continent, one with a daily average for a month of 10½ lbs. milk and first of the Nubians to enter the Advanced Registry. Watch the Goat Department of "The Times" for further notice.

BURTON C. PLATT

AUCTION

500 Holstein Cows and Heifers 500

2 Registered Holstein Bulls

All Dairy Equipment

On the Los Posos Land Co.'s Ranch,
2¾ miles west and ¼ mile south of

CORCORAN

Wednesday and Thursday, August 18th and 19th

Commencing Promptly at 9 A.M.

This is undoubtedly one of the choicest herds of grade Holsteins ever sold at public auction on the Pacific Coast. The owners have been carefully breeding and culling the herd for several years, using nothing but the best registered Holstein sires, have been testing the cows through the Kings County Farm Bureau Cow Testing Association for the last two years and we believe that buyers will find it to be one of the best producing herds in the State. The stock are all large, fine, well marked individuals with splendid udders, the kind for the new beginner for a foundation herd as well as for the older dairyman to improve his herd with.

Owing to the fact that the owners are putting their land into cotton and plowing up their alfalfa, they have decided to disperse this splendid herd at public sale and it offers an opportunity that no dairyman in the state should overlook.

We also wish to emphasize the fact that the young stock is from these high class cows and by registered sires of royal breeding. They are one of the best developed and best marked lot of heifers we have ever seen on the Coast, they are the making of unusually good producing cows. The heifers (and steers) will be sold in carload lots or in other lots to suit purchasers. NOTE:—All heifers, steers and 50 head of cows will be sold Wednesday, the 18th.

A representative from the Kings County Farm Bureau will be present to advise buyers of the butterfat production of the cows.

Included in the offering are 200 HEAD OF HOLSTEIN COWS, 70 head of two-year-old heifers, 44 head of yearling heifers, 60 head of heifers under one year old, 136 head of steers, one, two and three years old.

Prospective purchasers are invited to visit the ranch prior to sale and see the cows milked.

EASY TERMS: \$100 and under, cash; over \$100, one-fourth cash, balance in 4 and 8 months with note and approved security. Buyers from a distance who wish credit will be required to furnish satisfactory bank references.

Autos will meet morning trains at Corcoran both ways.

HEREFORD MEN TO STAGE A BIG EVENT

At a meeting of the board of directors of the Pacific Coast Hereford Cattle Breeders Association at Sacramento last week plans were made for holding a series of three sales at Sacramento, November 4, 5 and 6. It is expected that over 150 head will be exposed at auction during the three

days and that it will prove the largest single event in the beef cattle industry of the state. The association will sell about 40 head of selected females and bulls from the leading Western herds. An effort is being made to attract a consignment superior to the one sold at the San Francisco show last fall for an average of \$711. The following day J. H. Cazier and Sons of Wells,

Nevada, will sell 55 head of very superior cows, heifers and bulls. The Cazier sale is certain to attract wide attention owing to the high quality of their productions. The sale will feature the blood of Harris Standard 2d and the \$10,000 Beau Blanchard 76th. The third sale will consist of 45 head from the well known herd of H. M. Barngrover, Santa Clara.

The market for Herefords has been very active the last three years and it is felt that cattlemen will welcome such an unusual opportunity as the three sales will afford. All the sales will be managed by C. L. Hughes of the California Breeders Sales and Pedigree Company, Sacramento, and Col. Ben A. Rhoades of Los Angeles will be the auctioneer. The sales will be held at the state fair grounds.

NEVADA HEREFORD RANCH

Over 200 Choice Breeding Cows in Herd

Herd Bulls in Service:
Harris Standard 2nd
(425030)
Beau Blanchard 76th
(685487)
Abe Mischief (9769262)
Bocaldo 21st (720836)

A
100 Per Cent
Healthy Herd

Former Herd Bulls
Used in Herd:
Debonair 64th
(616840)
McCord (279679)
Precursor
(66671)

We have raised cattle thirty years, and bred registered Herefords sixteen years. We have never had a single animal rejected by the general health or tuberculosis test. Last June we applied for the federal accredited herd list and our entire registered herd, of 327 head, passed the federal test without a reactor. Statistics show that Herefords are practically free from tuberculosis and our record proves our herd equal to any.

A Richly Bred Herd

from the best producing families in the Hereford breed; to keep in the herd only animals that are good, regular producers.

Will Sell 55
Choice Herefords
at Public Auction
November 5

ARD 76th, eight young cows with calves at foot and rebred, ten select yearling heifers and four bulls.

Watch this space for further particulars regarding our breeding herd and cattle to be sold. Study the pedigrees of our herd bulls. We believe you will like them.

We also have a nice lot of cows and heifers for sale here at the ranch and forty good range or ranch bulls.

Correspondence and inspection invited.

The Public Confidence

An important part of the management of the Bell System is to keep the public informed concerning all matters relating to the telephone.

We consider this an essential part of our stewardship in the operation of this public utility. It is due not only the 130,000 shareholders, but it is due the whole citizenship of the country.

We have told you of new inventions to improve service, of the growth of service, of problems involved in securing materials, employing and training workers, of financing new developments, and of rates necessary to maintain service.

You have been taken into our confidence as to what we are do-

ing, how we do it, why we do it. You have been told of our efforts to meet unusual conditions; of how we have bent every energy to provide service in the face of storms, floods, fires.

It is an enormous task today to provide adequate service in the face of shortage of workers, raw materials, manufacturing production and transportation.

Nevertheless the service of the Bell System has been improved and extended this year. Over 350,000 new stations have been put into operation. And the loyal workers of the Bell System are establishing new records for efficiency and will establish new records for service.

CONDENSED BUTTERMILK

--EGG PROFIT

More eggs naturally mean MORE PROFIT—LACTEIN Condensed BUTTERMILK supplies the requirements for the heavy production of eggs. Albumen and Proteins are furnished by LACTEIN, and also the valuable LACTIC ACID which means perfect digestion and cleansing of the system. Laying hens are under constant strain and their system must be healthy, vigorous and strong. LACTEIN will prove more beneficial than any one food or tonic that can be procured. LACTEIN furnishes the FOOD OF ECONOMY AND PROFIT.

Healthy Hens Shorten Moults!

Healthy hens come quickly through the moult—and they are started on their work of producing eggs sooner. For reviving and building up hens after molting, LACTEIN supplies just the food and tonic to restore egg forming capacity and produce new feathers.

Cleanliness, a Factor in Economy

By Jean A. Koethen

No one who listened to Dr. Beach's address at the Van Nuys poultry institute could fail to see that while the doctor laid no stress upon the conclusion, contaminated ground plays a large part in certain diseases, while general sanitation is a sufficient cure for others. Take coccidiosis, for instance. This is a disease which is not perhaps due in the first instance to contaminated ground, yet it is passed on year after year to generation after generation of young stock by contaminated ground. Dr. Beach took pains to explain that coccidiosis can be controlled, even on contaminated ground, by the use of buttermilk. He did not say "Get your chicks off contaminated ground," but the conclusion was obvious.

Then there was the case of intestinal worms. Contaminated ground again passes the disease on year after year. The worms are in the ground. Only the most drastic treatment can eliminate them, yet we worry along year after year, treating worms with tobacco instead of putting our chickens on clean ground.

Fowl cholera was a third disease discussed. This is a new disease comparatively and its cause is suggested in the fact that in every outbreak of the disease a thorough cleaning up, with an antiseptic in the drinking water to check infection, eradicated it.

Is my point plain? What I am trying to say is, why do California poultrymen go on year after year permitting their flocks to be decimated by diseases due to filth in one form or another, and their vigor diminished by doctoring, instead of aiming the ax at the root of the matter and giving their birds an environment which is conducive to health? I don't know that we can blame the poultry division of the college of agriculture for handing out remedies instead of preventive measures. Remedies are what the people want. Prevention is too severe.

Dr. Beach claims that hens can be doctored for worms by the use of tobacco several months at a time and be none the worse for it. If this is true it is contrary to every principle of health. No child can have a severe illness and take medicine for several months without being the worse for it. It may recover in time and be as vigorous as it would have been, but the chances are against it. I do not believe any hen can suffer from intestinal worms or any chick from coccidiosis and ever be quite what it might have been. It may be apparently healthy and productive, but its constitution has suffered and sooner or later there results a condition of lowered vitality in the whole flock.

If vigor in California flocks were all it ought to be we might pass up this program of incessant doctoring, but the poultry division itself admits that there is much to be desired in this particular. Professor Lloyd stated in one of his lectures that when he tried to find perfectly vigorous stock for a former pupil he was disappointed to find how very rare such stock is.

The fact is that doctoring and constitutional vigor are as far apart as the north and south pole. If you will doctor you may as well renounce once for all hope of a highly vigorous flock. The two don't go together.

Cleanliness First and Always

If not doctoring, what then? What, indeed, but prevention, and prevention's big stick is cleanliness. Clean ground, clean air, clean water, clean houses and nests, finally clean bodies, inside and out, but of this I cannot speak now.

Most poultrymen acknowledge without question the necessity of clean houses, clean water and clean air, but shake their heads when you mention clean ground. You cannot be moving henhouses around. They are built to stay. How, then, can you have clean ground for your flock?

For the laying flock there are three alternatives: There is the no-yard house, which a good many believe is healthier than a house with a dirty yard. In the no-yard house the floor is covered every year or oftener with clean sand, all the old sand and litter being removed before the new is put

in. This guarantees perfectly clean soil once a year. In between, as often as seems necessary, the litter is removed and fresh litter supplied. Such a system, though not perfect, should do away with all danger of coccidiosis and intestinal worms.

The second alternative is the double yarding system. This, if properly worked, which it rarely is, should provide perfectly clean ground, but it cannot be worked in a minute. A yard must be allowed to grow a green crop for at least six months before it is thoroughly purified. I believe some authorities recommend a year's rest for each yard, but that seems hardly necessary if the right sort of a crop is grown. In the yards of one man who is really working this system I saw barley and Sudan grass two or three feet high. It had been growing for months, and as fast as it attained the proper height it was cut and run through a clover cutter for the birds. Meanwhile, the roots, after a copious irrigation, grew another stand. With a monthly irrigation such a stand of grain can exhaust a good supply of manure in six months.

The third alternative is portable

Stifel's Indigo Cloth
Standard for overalls

Remember—it's the cloth in your overalls that gives the wear!

The only way to tell that the **OVERALLS and COVERALLS**

you buy are made of genuine Stifel's Indigo—the strong, last-long, fast-color cloth that positively will not break in the pirt—is to look for this trade mark on the back of the cloth inside the garments.

Dealers everywhere sell garments of Stifel Indigo. We are makers of the cloth only.

Coulson Co.
PETALUMA, CAL.

houses. These houses are not in favor in Southern California and are hardly adaptable to any but backyard use for the laying flock. For the growing chicks, however, a portable colony house is entirely practicable and would do away with a large proportion of chick mortality. Professor Dougherty showed stereopticon pictures of portable houses used on the Davis farm. One of these, which is especially designed for backyard use, is eight feet square, holds 20 hens, and can be knocked down and put up again in a very short time by two men. Such a house would be very useful in an orchard. Another, five feet by six, is intended especially for use as a colony brooder. With a small brooder stove to provide heat it will hold 50 chicks for two months or 100 for a shorter time. If the brood is not too large the pullets may remain in it indefinitely. In the 8 by 8 house 100 chicks can be kept from the incubator till they are nearly ready to lay.

I understand, of course, that no big poultryman thinks he can afford to keep chicks in such small flocks. For them the only way is the double yard system with good big yards and as much extra range as possible, with the yards thoroughly purified between seasons.

When we talk of "affording," however, can even the big poultry men afford to lose as many chicks as some of them lose every year under the present system? A chick is a little thing, but it costs 20 cents or thereabouts, and 20 cents multiplied by 100 or so runs into real money. Losing a chick is bad enough, but to lose a full grown hen that has cost a dollar and a half to raise is worse. It is these losses from disease that tip the scale, and in these losses contaminated ground plays a larger part than some would care to admit.

Clean Air

The matter of ventilation is relative and inversely as the square of the number of hens in the house. What would be sufficient air for 20 hens is scant for 50 and stifling for 100. When one sleeps in the open for a few weeks he realizes how far from pure is the air of a well ventilated room occupied for eight hours by one person. What must be the condition of the air in a poultry house containing 320 square feet and half as many hens, with all the air coming in from one side and no circulation? Our hens, perhaps, are trained to live without pure air, but they cannot help succumbing to roup now and then when they are forced to swelter all night in a crowded house and then go out in the chill daybreak to pick up breakfast.

Quite as harmful as lack of oxygen is the odor from piles of droppings that have accumulated under the roosts for a week or more. Droppings should be removed twice a week in the smallest flock. I do not see how the owner of a large flock, keeping his hens under the conditions demanded in commercial production, can maintain health without removing the droppings every day, yet there are many who neglect this precaution. Polluted air, breathed night after night, is a fruitful source of roup and possibly of other diseases. Those outbreaks of fowl cholera, so mysterious in their origin and so readily controlled by cleaning up, may they not have been due to this very thing?

We hear a good deal about the loss due to carelessness in handling eggs, and the poultryman whose statement shows a deduction on account of cracks and rots gets a jolt that sets him to eliminating cracks and rots. How about the man who loses half a dozen hens today with fowl cholera and three or four next week with roup, and who counts his chick losses from coccidiosis at from five to ten per cent? Are we to be more careful of an egg worth a nickel than of a hen worth two dollars? Shall we keep on vaccinating to control chicken pox or get in and clean up so thoroughly that no chicken pox germ can live from one season to another? Wouldn't raising chicks in lots of a hundred each in portable colony houses be better than seeing ten per cent of those hatched drop off every year with white diarrhoea and coccidiosis? When we are looking for the little leaks isn't this a good place to begin?

Envy ought to be kicked out of every life because it is a consumer and a non-producer.

Poultry Queries

Conducted by J. A. Koethen

Roup in Turkeys

Is there any cure for roup in turkeys? Mine have a discharge from the nostrils and a swelling under the eyes.—Subscriber, Garden Grove.

If there is pus in the swelling under the eyes it may be necessary to open

it and cleanse with peroxide diluted with an equal quantity of water, but unless the swelling is large it is better not to touch it. Dipping the head in a solution of potassium permanganate is the simplest remedy for these ropy cases and as effective as any. Purchase ten cents worth of permanganate crystals at the drug store. Put a pinch of these crystals in a quart or more of slightly warm water, just enough to make the water a good, deep purple. Massage the turkey's nostril with your thumb and finger, rubbing upward toward the eyes, in

order to loosen the secretion. Then dip the head in the solution and hold it there while you count ten. The permanganate solution cleanses the nasal passages and gives nature a chance to work. This should be done night and morning till there is improvement. Always prepare a fresh solution for each treatment. Potassium permanganate loses its strength quickly in solution and for this reason has little effect when used in the drinking water. I take it for granted your turkeys are roosting out of doors. If they are not, they should be.

POULTRYMAN'S CALENDAR—AUGUST, THE VACATION MONTH

Things are a little easier in midsummer, and the poultryman can get a few days off now and then if there is anybody at home to feed and gather the eggs. Probably the most imperative task, outside of feeding, is keeping the place clean. Mites multiply rapidly in hot weather and can do much damage. Clean out the droppings daily, if possible, wash with the hose, and paint roosts and adjacent boards with crude carbolic acid and kerosene, one part acid to four or five of kerosene; or with carbolineum or a cresol preparation. Cleanliness is especially important in coops occupied by young stock.

Hens that begin to molt in August should be culled out and precocious pullets held back by giving them the conditioning mash of bran and bonemeal or by making the ration more fattening with a larger proportion of grain. Now is a good time for caponizing late hatched cockerels. This is done at about two pounds weight, or just before the birds begin to develop sexually.

CALIFORNIA FARM BUREAU EGG LAYING CONTEST AT SANTA CRUZ

By Max Kortum

During the past two weeks there has been a marked change in the position of some of the leading pens. Enterprise Ranch is back in second place with R. C. Gibson of Newhall a close third, while B. F. Rose of Santa Cruz has dropped back to fourth place. The leaders are lined up as follows:

Walls, 1,647 eggs; Enterprise, 1,586; Gibson, 1,584; Rose, 1,577; Bellows, 1,561; Gibson, 1,513; Peck, 1,512. High Pens for Week Ending July 31

Neef, 47 eggs; Bellows, 47; Gibson, 46; Gibson, 46; Barker, 46; Stalling, 45; Clark, 43; Wood, 42; Schlink, 38; Gray, 37.

FAIRBANKS SCALES

Accurate Weights now even more important

TO GET first hand facts about your farm crop weights you must have a dependable scale. Such a scale tells you whether or not you are feeding your stock for profit.

It tells you exactly what that stock should market. It assures you greatest returns from your produce.

It checks the weights of what you buy—whether it be fertilizer, feed, live stock or seed.

You should have a Fairbanks Scale for Wagon and Stock use. In your neighborhood it will become the local standard by which all other weights are judged.

BETTER STATE FAIR

(Continued from Page 198.)

Rosa, and James Marwick, Santa Barbara.

The milking Shorthorn classes will hold more competition than last year. Thos. Harrison of Santa Rosa; J. D. Rowe & Sons, Davis; Chas. L. Weaver, Tulare; Wm. Bond, Newark, and Geo. A. Murphy, Perkins, complete the list.

For the first time in years no Ayrshire cattle will be seen at Sacramento. For some reason none of the many good herds will enter.

The swine department will be one of the most interesting divisions of the fair. Contrary to all prediction, the show, save for Hampshires, will be as well balanced as ever. Indeed, it is expected that some of the greatest classes ever shown in the West will come before the judges.

In point of numbers the Poland China classes are the largest. About 35 exhibitors are already in with entries.

Pre-show "dope" has it that both boar and sow classes are to be strong and no one appears to have a walk-away. It is also the opinion of those in touch with the situation that the general average will be superior to last year's. The question of type has been definitely settled in this state and will therefore not intrude into the judging. The following Poland China herds are entered:

Bassett Bros., Hanford; Shinn & Elliott, Tulare; H. C. Shinn, Tulare; H. A. Johansen, Fresno; A. J. Elliott, Tulare; Gatewood & Stephens, Fresno; Kern County Union High School, Bakersfield; W. L. Haag & Son, Hanford; Johnnie Glusling, Winton; V. W. Dubil & W. E. Martin, Visalia; Deforest & Horr, Susanville; Thos. Caesar & Son, Reedley; P. E. Mitchell, Atwater; J. N. Cook, Orland; A. D. McCarty, Modesto; R. J. Yates, Orland; Chas. Gatewood, Fresno; A. Buckland & Son, Fresno; Nettle E. Anderson, Modesto; J. F. Lehman, Lodi; Fred D. Ross, Hanford; C. McNeil & F. Gatewood, Fresno; Geo. V. Beckman & Sons, Lodi; Beckman & Langhorst Bros., Lodi; Maurice Hollingshead, Orland; Lillie Maywood, Willows; E. M. Locke, Lockeford; N. K. Horan, Lockeford; Marshall & Son, Sebastopol; Viola L. Renwick, Santa Barbara; W. A. Young, Lodi.

State fair visitors will have an opportunity to see several of the highest priced Duroc-Jersey sows and boars of the breed. During the past year California breeders have made many notable additions to their herds and most of the distinguished animals have been entered. Mrs. R. M. Whitley of Van Nuys recently paid \$15,000 for the boar, Jumbo Sensation, which has been entered and it is expected that the contest for the grand championship will be a battle royal. The sow classes will be just as interesting and will include the Diamond Bar Ranch sow, Queen of Pathfinders, for which Fred Lewis paid \$10,200. The Duroc show will be made up from nearly 30 of the top herds of the state. The preliminary list includes:

Winsor Ranch, Bonita; V. F. Dolcini, Davis; Harvey M. Berglund, Dixon; W. M. Way & Son, Modesto; Diamond Bar Ranch, Spadra; Western Laboratories, Stockton; C. D. Bright, Orland; Ordway & Snyder, Hughson; J. P. Walker, Visalia; Grover C. Hamilton, Stockton; J. E. Thorp, Lockeford; W. J. Fulgham & Sons, Visalia; Joe N. Chinoweth, Visalia; Jos. Borge, Dos Palos; E. G. Stone, Modesto; W. T. Hollingshead, Orland; R. S. Christman, Yuba City; Witherow & Stafford, Live Oak; Hollow Hill Farm, Colton; Lew Wallace Jr., Folsom; Carl Woosley, Bonita; Mrs. R. M. Whitley, Van Nuys; Dixon & Dixon, Hughson; H. A. Baum, Placerville; Elmer Lamb, Ceres; J. Peterposten, Galt, and Blanch Bright, Orland.

L. A. Weaver of Columbia, Missouri, will rate both the Poland China and Duroc classes. Weaver is counted one of the most competent swine judges in America. He will judge Polands and Durocs at the Illinois state fair and is one of the two Duroc judges at the coming National Swine Show. His placings will be watched with keen interest.

The annual showing of Berkshires at Sacramento is generally conceded to be second only to the National show, and this year California and Nevada breeders will be out in force. Several new herds will be noted. D. J. Bastanchury of La Habra and the Italian Vineyard Company of Guasti will make their first show, as will a number of other herds. The list of exhibitors follows: J. Francis O'Connor, Santa Rosa; H. W. Cannon, Susan; Superior California Farm Lands Company, Monroeville; Napa State Hospital, Napa; J. G. Throckmorton; Mrs. J. G. Throckmorton; Sandercock Land Company, Sacramento; Anchorage Farm, Orland; Grace Trumbull Reed, Sacramento; H. F. Alps, Reno; A. B. Humphrey, Tom Hyland, Sebastopol; D. J. Bastanchury, La Habra; Italian Vineyard Company, Guasti. Wilson Rowe of Davenport, Iowa, will act as Berkshire judge. Small showings of Chester Whites and Tamworths will also be made. A Tamworth herd from Illinois has been entered.

The draft horse division has a lighter entry list than common. Strange as it may seem, the lack of entries has been explained by increased sales the past spring. N. W. Thompson of

(Continued on Page 207.)

Household Department

AN EARLY START

There's a magic in the mornin'
When the mist hangs o'er the lot
Like a fairy cloak of silver
That the queen of night forgot.

There's a taste of midnight shadows,
There's a lurkin' hint of rain,
There's a heady smell of sweetness
That intoxicates your brain.

There's a blithesome, thrilly something
That just crinkles up your heart
On a gray and misty mornin'
When you get an early start.
—New York Sun.

A HOUSE FOR RENT

(Concluded.)

"Telling dad" proved almost as exciting as befriending the Douglasses had been. Mr. Proctor was concerned and amused, and touched and indignant by turns, while good Mrs. Proctor could hardly be restrained from jumping up from the supper table to run down and see what the new tenants needed for the night.

"Mother!" implored both boys, "don't act as if she were a charity person! She is Jessie Mallard—Major Mallard's niece."

And though to most people it would have seemed indeed that Jessie Mallard had come perilously near to being an object of charity, so entirely did the Proctors take the tone of their being desirable renters that, after a strained day or two, the plucky young people regained their poise and courage and at the end of a fortnight the tenants on the back lot were fast friends with their landlords.

At the first attempted word of business between Harvey Douglas and Mr. Proctor the latter yawned him off. "I have nothing to do with it, Douglas. My boys are running this whole affair." So Douglas sought the boys.

With the boys there was a critical moment when young Douglas offered Sam a \$10 bill at the end of the first week.

"That will be a month's rent, and we don't collect until the end of the month," Sam said, flusbing.

"You don't mean that the whole rent will be only \$10 a month?" asked the soldier.

Sam bowed, floundering desperately for something to say, and finally recalling a scrap of Mr. Wakely's conversation.

"That represents a good return on our outlay," he said, sedately.

"Whew!" whistled Douglas, slipping the note back into the pocket which held such a meager supply. "That's wonderful luck for us."

Jessie looked up brightly; she was leaving baby asleep in his father's care for an hour, while she ran off for a chat with Cynthia Adams, a former schoolmate, who had just discovered her presence in town.

An hour later she returned, face burning.

"What's the matter, dear?" Douglas asked as she stepped into the odd, attractive living room and bent over the sleeping baby.

"Oh, Harvey! Cynthia asked where we were staying, and when I told her, she was so excited. She said all the town had been interested in the Proctor boys' experiment. 'You must pay a fancy price for it,' she said, 'for it seems the boys fixed up this place in order to make money to go to the academy—and I believe to Moosehead Camp, too.' But think of what they are letting us have it for!" she choked and dropped her dark bead on his knee.

Harvey touched her gently with one hand, while he held the other out before him. "Hold steady, old girl," he said huskily. "The shake has almost gone out of my hands, and if we can hold on a little longer I can get back to my work. But, Jessie, I couldn't make a go of it yet."

"I know it's all right, Harvey," said Jessie, brightening suddenly. "Some day we'll make it up to those boys, won't we?"

Even while she was speaking, Cynthia's impulsive little note was winging its way over to the academy. She had seen beneath Jessie's surface cheerfulness and guessed more than the other dreamed. Having been a favorite with the Major in school holidays, she made bold to tell him of his niece's presence in town, and added a hint of the difficulties she suspected. This gave the offended guardian the

excuse he had long wanted, and the following afternoon saw his car nosing its way down the side road to the Proctor garage.

It wouldn't do to tell of that interview. If people can forgive and forget misunderstandings and hasty words, outsiders have no right to pry into their mutual apologies. Harvey would have been glad to scrape through without the Major's help, but Jessie, perched on his knee as of old, told him all, not forgetting the Proctor boys.

"Bless my soul!" the warm hearted Major cried, "take me up there right now, will you? I want to see those fellows."

"Not a word of this, though," cautioned Jessie.

Major Mallard's call on Mr. Proctor assumed the aspect of a friendly courtesy, but at the close he put the real object of his visit in plain words.

"I am anxious to have boys like yours, Proctor, at the academy," he said, "and I wish to offer your oldest son a scholarship recently established at the school and left to my discretion. He might enter at the beginning of the next term, if convenient to you, and of course it would entitle him to membership in the camp next summer."

"It is the younger boy, uncle," Jessie interposed desperately, "who is so keen on going to camp."

"Why, certainly," the Major covered his lapse of memory gallantly, "but naturally the younger lad would be included as his brother's guest."

And perhaps this is the reason that Mr. Proctor always says, when he is asked about Sam's and Randall's experience as real estate agents:

"Successful! I should say so. One tenant alone netted them enough to live on for a year!"—King's Treasures.

HOUSEHOLD QUERIES

Canning Queries

Will you kindly send me the recipes for the following: For canning cucumber pickles; for canning sourkraut? Do you use its own brine in canning? For canning green beans.—Subscriber, Newbury Park.

A recipe for sour cucumber pickles is given by Mrs. L. M. O., Porterville, on this page, as are many others for sweet cucumber pickles by other readers. These recipes were sent in answer to similar request from a Cultivator reader in the issue of July 31. Extended directions for canning green beans will appear next week in this department.

As to canning sourkraut: Our subscriber asks only as to canning sourkraut, but assuming that others may wish to know also how to prepare the kraut in the first place, we quote from Mrs. Wilson's Cook Book (reviewed in this department last week):

"Remove the coarse, bruised outside leaves of cabbage and shred the head fine. Line bottom of small barrel or wooden bucket with the outside leaves, then place in a layer of the shredded leaves and cover with salt. Repeat until the vessel is nearly full, pounding down well with wooden mallet when packing. Sprinkle salt over top and cover with large cabbage leaves and then with cheesecloth wrung out of salt water. Tuck in the ends carefully and place board on the kraut, weighted down with a heavy stone. It is necessary that the kraut be kept entirely covered with the brine. Remove scum as it rises to top. The kraut will be ready for use in six weeks and it must be kept in a very cool place or canned.

"To can, fill into sterilized all glass jars and fill jars to overflowing with boiling water. Adjust rubber and lid and partially tighten. Process (boil) in hot water bath for one hour, remove and seal tight. Store in cool, dry place."

Pimento Marmalade

Did you ever hear of making marmalade from pimentos? I hear it is very delicious. Could you get me the recipe?—Subscriber, Santa Ana.

Cut off ends, remove seeds and stringy portion from 30 ripe pimentos, wash well and put through food chopper. Place in saucepan and add two cups of stewed tomatoes. Cook till

The Cultivator Patterns

BE SURE TO SEND SIZE

3283. Misses' Dress—Cut in 3 sizes: 16, 18 and 20 years. An 18 year size will require 5 1/2 yards of 36 inch material. The width of the skirt at lower edge is about 1 1/2 yard. Price 10 cents.

3309. Junior Dress—Cut in 3 sizes: 12, 14 and 16 years. A 14 year size will require 5 1/2 yards of 27 inch material. Price 10 cents.

In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEEKS; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT
California Cultivator
Los Angeles

pimentos are soft. When cool rub through fine sieve. Measure and return to kettle, and for every eight cups add juice 2 oranges, juice 1 lemon, 1/2 pound seeded raisins, 1/2 cup Maraschino cherries cut into bits, 1/2 candied citron put through food chopper, 5 cups sugar. Cook slowly till very thick. Pour in sterilized glasses. When cold cover with melted paraffine and store in cool place.

To Peel Pimentos

How can I peel pimentos before canning? I want them to look like the kind you buy.—Subscriber, Artesia.

To peel place in very hot oven for short time until skins can be easily slipped off with fingers. They can also be peeled after dipping for a short time in very hot cottonseed oil. Cool, remove skins, cut out stems, seed cores and stringy portions. Pack in cans or jars. Fill with boiling water. Seal cans or place rubbers and caps loosely on jars. Boil hard in wash-boiler sterilizer, 40 minutes for cans, one hour for jars. Tighten tops of jars.

Voting for Your Own Candidate

After the Tennessee legislature records itself on woman suffrage, please discuss in your valuable paper a Hoover and Coolidge ticket. Is there any illegality in writing in name if it is not on the ballot? Yours in distress.—Subscriber, El Cajon.

The Cultivator, as its name indicates, sticks to cultural problems of the farm, leaving discussion of politics to the general publications. The voter is at perfect liberty to write in name of his or her own candidate on the ballot.

Lead Arsenate on Corn

In using lead arsenate to prevent ear worms in sweet corn is there any danger from poisoning? Must one be very careful to wash the corn before using?—Subscriber, Modesto.

The lead arsenate is scattered on the silks so that it would be practically impossible for a single grain of it to reach the ear, and it is not applied after the silks are dry, so that it would have lost its virulence by the time of maturity. If any should adhere to the husk and be brushed against the ear in process of shucking, the ordinary washing after silking would remove any possibility of danger.

Mending Cut Glass

I broke a fine cut glass dish and would like to know if you still have that dish glue recipe where mended dishes did not come apart in hot water. It was published some months ago but my paper got lost before I cut it out. Now if you or some reader would kindly send it to me I would be greatly obliged.—Mrs. H. P. Bartholomew, Ripon.

Sorry, but we cannot locate this recipe in the Cultivator for past 12 months. If any of our readers have saved it and will copy and forward to this office it will be greatly appreciated. Meantime we send directions for what is called "Diamond Glass Cement." We cannot, however, guarantee it not to melt in hot water.

Dissolve two parts isinglass in 3 parts 90 per cent alcohol and add with constant stirring 4 parts powdered rosin. This cement must be kept in absolutely tight bottles, as it solidifies very quickly. Clean thoroughly broken parts, dry, apply glue with fine brush to both sides very thinly, the thinner the better; fit together exactly and press firmly together, holding in place with rubber bands if possible. Do not use or move for two or three days.

A DISTURBANCE

During sermon time the other day a baby began to cry and its mother carried it towards the door.

"Stop!" said the minister, "the baby is not disturbing me."

The mother turned toward the pulpit and made the audible remark, "Oh, 'e ain't, 'e? Well, you're a disturbin' of 'im."

It's good to have money and the things that money can buy, but it's good, too, to check up once in a while and make sure you haven't lost the things that money can't buy.—George Horace Lorimer.

SWEET PICKLES

Some service! In the Household Query columns of July 31 Mrs. J. W. M. of Fresno asked Cultivator subscribers for recipe for sweet pickles. The response has been more than generous. One recipe was received in time to print in last week's issue; this week we print 19 and more are coming.

Just a word of explanation. Possibly readers do not realize that copy for the household department must be in the office of the Cultivator not later than Saturday morning early of the week preceding date of issue.

Cucumber Mustard Pickles

Sweet: 1 cup mustard, 2 cups sugar, 1 cup (scant) salt. Wet with a little cold vinegar and mix well, then add to 1 gallon mild cold vinegar.

Soak the cucumbers (either large or small) overnight in clear water, which will make them very brittle, then drain, wipe dry and place in jars. Cover with the cold mustard vinegar, put the jar rubber on and rub just a little lard around on the rubber, then screw on top.

Sour: This same recipe, by using the sour vinegar instead of the mild, and one cup of sugar instead of two, makes the sour pickle.—Mrs. L. M. O., Porterville.

Sweet Cucumber Pickles

One hundred green cucumbers about two inches long will fill four glass quart jars. Soak 24 hours in rather strong brine. Then pour off the brine and rinse in clear water. For this number of cucumbers use 3 quarts pure cider vinegar, 1 pound brown sugar, 1 ounce whole cloves, 1 ounce stick cinnamon, 1 ounce small black peppers, a little horseradish, sliced, a few small redpeppers. Scald the cucumbers in the vinegar. As soon as the vinegar is scalding hot dip them out, fill the jars and then pour the vinegar over them till the jar is full. Seal while hot.—Mrs. A. G. U., Hemet.

Watermelon Pickle

Responding to the appeal of Mrs. J. W. M. of Fresno in the issue of July 31 for a sweet pickle recipe, here is one that has been used in our family for a number of years. It is primarily for watermelon, but is good for many other fruits suitable for pickles. The alum, of course, is used in the case of the watermelon.

Pare off the hard green rind; cut in small pieces, inch sizes very good. Soak overnight in strong alum water. Following morning drain and scald in fresh water. Then make a syrup of 1 pint vinegar to 2 pints white sugar. Put in the melon, simmer 10 minutes. Add spices to taste. Scald this syrup and turn over pickle for three mornings. Seal in jars as you would fruit.—H. H. Rogers, Sanger.

Sweet Cucumber Pickles

I just now saw the request for sweet pickles. I want to give my recipe for cucumber pickles. I gather them in the morning when they are nice and fresh. I pick them from three to five inches in length, split the larger ones. To about 2 gallons I cover with water containing 1 cup salt. The next morning I take out of this brine, wash in fresh water, then pour hot water over them. In the meantime I have my vinegar ready. To 1 quart vinegar, 1 pint sugar, a bag containing mixed spices to suit taste, also a few pieces of horseradish and some dry mustard add to the flavor. Have this boiling and drop well drained cucumbers in syrup and boil just long enough to have them thoroughly hot. Put in glass jars and seal up as any fruit and they keep indefinitely. Everybody likes my pickles.

The lemon cucumber may be used in the same way. If they are cooked too long it makes them soft.—Mrs. L. E. C., Winters.

Good Cucumber Pickles

One gallon vinegar, 1 cup sugar, 1 cup salt, 1 cup mustard (not the seed). Boil all together, then pour over the cucumbers. They will keep without being sealed and will be nice and firm. Do not salt the cucumbers before making them into pickles. This vinegar and spice mixture is enough for 400 small pickles or two gallons of larger ones. They are the best I ever ate.—Mary L. Hootman, Puente.

Sweet Pickles

In answer to Mrs. J. W. M. of Fresno, will say the following is one of the best sweet pickle recipes I've tried: To 500 small cucumbers allow

CHEAPEST HEAT YOU CAN BUY

The Silevort Oil Burner burns either distillate or kerosene oil in cook stoves, heaters, furnaces, pasteurizers, boilers, prune dippers, dairy sterilizers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes. Address Silevort Oil Burner Co., 710 North Main St., Los Angeles.

When writing advertisers, mention the Cultivator.

3 quarts cider vinegar, 7 ounces mixed pickle spice (or 2 ounces each cinnamon, allspice, cloves and a few small peppers), 3 pounds sugar, light brown or white. Let cucumbers stand in salt water overnight. Put cucumbers together with spices and sugar into cold vinegar. Heat and boil two or three minutes. Pack tightly in jars, fill with the boiling vinegar, and seal. If vinegar is too strong a quart of water may be added.—L. Denk, Encinitas.

Sweet Pickles

Wash small cucumbers and put to soak in hot salt water strong enough to bear up an egg. Let soak for 24 hours, then scald three times, letting them stay in the water until cold each time. Scald enough vinegar to cover them, add sugar and whole spices (as for any sweet pickles). Pour over pickles while hot and seal. I also add a small piece of alum to vinegar.—Subscriber.

Two Good Ones

Here are two very good recipes for sweet pickles, both excellent, but the first much simpler:

No. 1—Soak the cucumbers over night in strong salt water. In the morning wash and dry. For a quart of pickles take two and a half cups vinegar. Tie up in a cloth bag 1 level teaspoon cloves, 1 of allspice, cinnamon and celery seed. Mixed spices may be used instead. Heat to boiling the vinegar, spices and 4 tablespoons sugar. Put in the cucumbers and when they come to a boil let boil just two minutes. Can at once.

No. 2—Put the cucumbers in a stone jar and cover with boiling water. Let stand over night. In the morning wipe dry and put in fruit jars with 3 or 4 pieces of horseradish root. To 1 gallon vinegar add 1 cup sugar, 2 tablespoons mixed spices, 1 tablespoon grated alum. Let this come to a boil and pour over the pickles and seal up at once.—Laura Watson, Modesto.

Stuffed Sweet Pickles

Make a brine that floats an egg and soak in it for 12 days 12 large ripe or green cucumbers of uniform size. Remove the cucumbers and soak them in fresh water for 24 hours. Split the cucumbers lengthwise, remove the seeds and place them in a kettle with alternate layers of grape leaves. Over each layer sprinkle a little pulverized alum. Cover with equal parts water and vinegar and heat to boiling point. Remove the pickles and stuff them with seeded raisins and cubes of lemon. Use a lemon without the rind removed to a pound of raisins. Tie the parts of each cucumber together and place them in a jar. Sprinkle whole cloves and cinnamon over each layer. Make a syrup of 1 quart sugar to 1 pint vinegar and pour over the pickles. Each morning for nine days take off the syrup, reheat, and pour over the pickles.—Mrs. O. O. Carpenter, Earlimart.

Spiced Grapes

One-half gallon grapes, syrup of 1 quart sugar, 1 pint cider vinegar, 1 tablespoon mixed spices. When syrup has boiled thoroughly pour in grapes, cook 1 minute and seal (spices should always be bound in cloth).—Mrs. Maud R. Obarr, Santa Ana.

Peach Pickle

Select cling peaches of uniform size, peel and wash. 6 pounds peaches, 8 pounds sugar, 1 pint vinegar, ½ cup water, 1 teaspoon cloves (put one in each peach), few sticks of cinnamon. Make good rich syrup, drop in peaches, boil until tender, can, then pour syrup over and seal.—Mrs. Obarr.

Flaming Tokay Grape Sweet Pickle

Seven pounds grapes cut from cluster with scissors, leaving a stem stopper in opening. Syrup 3½ pounds sugar, 1 pint vinegar, ½ cup water, 1 teaspoon whole cloves, cinnamon. Boil grapes until hot through, then can.—Mrs. Obarr.

Sweet Green Tomato Pickle

Choose mature green tomatoes. Peel, prick, salt and drain over night. Boil syrup of 1 quart vinegar, 3 pounds sugar. Add mixed spices and ½ cup white mustard seed and tomatoes enough to be covered by syrup. Cook until tender.—Mrs. Obarr.

Watermelon Rind Sweet Pickles

Ten pounds watermelon rind. Trim carefully all outer rind and red. Cut in uniform sizes, boil in clear water until cooked but not soft. Make syrup

of 2 pounds white sugar, 1 quart vinegar, ½ ounce cloves, 1 ounce cinnamon. Pour this syrup boiling hot over rind three days in succession and seal.—Mrs. Obarr.

Satsuma Plum

Peel very thin skin off 7 pounds plums. Use 3 pounds sugar, 1½ pint vinegar (cider), cinnamon and cloves to suit taste. Bring this syrup to boil. Drop in fruit and cook until fruit can be pierced with straw. Lift fruit gently to jar. Cover with syrup.—Mrs. Obarr.

Crabapple Sweet Pickles

Nine pounds crabapples, cored or whole as you choose. Steam until just done.

Make syrup of 1 quart good cider vinegar, 2 pounds sugar (cinnamon bark and cloves in cloth). Pour syrup boiling hot over fruit for three days.—Mrs. Obarr.

Sweet Pickled Carrots

Select young carrots of uniform size. Boil until tender, cool and pack in glass jars. Fill jars to overflowing with hot syrup made by boiling together for five minutes 1 pint vinegar, 1 cup sugar and 2 tablespoons mixed spices. Seal the jars at once.—Mrs. Carpenter.

Sweet Crabapple Pickles

Select a peck of highly colored ripe crabapples, wash and cook them in the following syrup until almost transparent: 2 quarts vinegar, 3 quarts brown sugar, spice bag containing 1 tablespoon whole cloves, ¼ ounce cinnamon. Transfer the apples to glass jars. Cover with the boiling syrup and seal.—Mrs. Carpenter.

Dutch Pickles

One dozen green peppers, 1 dozen ripe peppers, 1 dozen green tomatoes, 1 dozen onions, 2 cups brown sugar, salt to taste, 3 cups vinegar. Take seeds out of peppers and grind or chop them, also onions and tomatoes. Cook until tender and seal.—Subscriber.

(Subscriber who sent this recipe asked us not to use her name in paper. But she also forgot to give us her address, so we ask her to mail address of one to whom she wishes subscription credit given, that we may be able to send the Cultivator.—Edit.)

MADE MADE WASHING FLUID

Here is a washing fluid vouched for by Mrs. F. P. Moore of Rucker, Arizona. Mrs. Moore gave the recipe for mixing and directions for using to members attending the last meeting of the Rucker Home Club. Here they are:

"Ingredients: Two pounds of unslaked lime, four pounds sal soda, one-half pound borax, 20 quarts or five gallons of water.

"Method of mixing: Mix all ingredients together and let boil 20 minutes to half an hour. Stir occasionally while boiling. Remove from the fire and let stand all night to allow sediment to settle. Next morning take off the clear liquid and bottle; the sediment may be saved and used for scrubbing floors, porches, etc.

"The above amount is sufficient for the average family for six months and costs about \$1.

"Directions for washing: Sort the clothes and soak them overnight in cold water. In the morning, fill a boiler with cold water to which add one-half cake of laundry soap shaved fine and one cupful of the washing fluid. Wring soaked clothes and place them in the boiler, putting in the least soiled clothes first. After the boiling point is reached let them boil 20 minutes. No rubbing is necessary. After boiling, the clothes are removed from the boiler and rinsed thoroughly in four waters, blueing being added to the last rinse water. Keep the first rinse water warm and add colored clothes, such as gingham, to this water and work up and down with the hands. No rubbing is necessary.

"If any clothing, such as men's overalls, have tar or grease on them, they can be cleaned by placing the garment on a board or table and scrubbing with a scrub brush and soap. Then boil them in the washing fluid, using proportions given above, for 20 minutes and they come out clean.

"If one is using a washing machine, one-half cupful of fluid may be added for each four gallons of water used in the machine. It greatly facilitates cleansing. This fluid is neither hard on the clothes nor on the hands."

Well cased with vitrified socket pipe. A, pump stand; B, pump rod; C, riser pipe; D, cylinder; E, check valve; F, vitrified socket pipe; G, joints packed with a strand of oakum dipped in grout and filled with cement mortar; H, pump rod guides; J, platform; K, gravel foundation; L, cross-planked cover.

Free copies of this bulletin may be obtained from the Division of Publications, U. S. Department of Agriculture, Washington, D.C.

TWO OUT OF EVERY THREE WELLS ARE POLLUTED!

Out of 51,544 wells on farms recently tested by the U. S. Public Health Service, more than 2 out of every 3 indicated impure water! Yet almost every farmer insisted his water was the best in his county. The common fault was dug wells, without watertight casings to prevent seepage from barnyards, privy vaults, etc., leaking into the water.

These figures are alarming. Yet it is hard to believe that your water which tastes, looks and smells so clean is exposing your whole family to typhoid, dysentery and other water-carried diseases—but neither did these other farmers believe it until the Health Officers found 2 out of every 3 wells to be unsafe.

Considering cleanliness, tightness, durability and cost, perhaps no lining is better than heavy, Vitrified Salt Glazed Sewer Pipe. Either socket or ring pipe may be used. Socket pipe leaves smoother joints inside than does ring pipe or drain tile, and the joints are more easily made tight, advises the U. S. Department of Agriculture in Farmers' Bulletin No. 941.

Provide safe water for your family! Write for booklet.

Wheat: Mixed feed, Northern, 60.00.

HAY

Alfalfa Growers of California report: All the alfalfa hay of the better grades listed with us this week found a ready market at prices averaging the same as last week. Demand for these grades is exceeding the supply and it looks as if it would continue to be the case from now on. Offerings by growers of these better grades have become comparatively smaller in volume than those of lower quality, as a result of which the discount on such inferior or damaged lots has widened somewhat. The tendency among growers seems to be just now to market their lower grade hay in preference to the better grades. It is difficult to determine definitely at this stage to what extent they are doing this, because they want to hold their better quality hay for sale later on, or whether the cause is the relatively lighter average production of first class hay. We know the latter to be the case in some of the important producing sections. Should the general final result be a comparatively smaller production of first class hay, as now seems probable, this would of course by and by stiffen the demand for the lower grades and they would therefore sell to better advantage than at this time of the year when there is still a fair supply of first class hay available to buyers. There were approximately 1,900 tons of hay of all kinds received on the tracks the week ending August 7 as against 2,000 tons received the week before. There were 500 tons left over unsold.

BEANS

California Bean Growers' Association, San Francisco, August 2:

At the present writing it is very difficult to state just what the market is, as some of the dealers are quoting ridiculously low, endeavoring to move some of their stock on which they are obliged to liquidate. The offerings for shipment are about as follows:

Pinks	6.40@6.65
Large Whites	6.00@6.25
Small Whites	5.75@5.90
Blackeyes	8.00@8.25
Bayos	10.00@10.50
Mexican Reds	8.00@8.50
Red Kidneys	14.50@15.00
Cranberries	7.00@7.25

DRIED FRUIT

Peaches—1920.

California Peach Growers, Inc., prices:

Practically peeled—
Cartons, 60 11-oz. per case..... 9.00
Cartons, 24 2-lb. per case.....10.20
Cartons, 10 5-lb. per case.....10.50
Apricots—1920.
California Prune and Apricot Growers,
Inc., prices:
"Growers" "Sunswet"
Choice@22½@24
Extra choice@24½@26

Standards@18
Slabs@20
Flgs—1920.
Roeding Flg & Olive Co. prices to
growers: White Adiratics 7 cents net.
Mission figs at a basis of 6 cents.
Schedule announced White Adriatic,
bulk in 50 pound boxes: Standards, 9;
choice, 11; fancy, 13; extra fancy, 15.
Black Mission figs in 50-pound boxes:
Standards, 7; choice, 10; fancy, 12; extra
fancy, 14.

GRAIN
Wheat: 3.50@3.80.
Oats: Red feed, No. 1, 2.40@2.60; Seed,
2.85@3.00.
Corn: California Yellow, nominal; Cali-
fornia milo maize, 3.10@3.20.
Barley: No. 1 feed, 2.35@2.45.

HAY
Alfalfa Growers of California under
date of August 1:
No. 1 Dairy Alfalfa.....32.00
Standard Dairy29.00
Stock Hay26.00
Under date of August 7, A. W. Scott Co.
says:

Receipts past week 3,344 tons. Some
little is coming in upon consignment in
cases where no direct offers have been
made satisfactory to producer. The
market has gone off practically 2.00 a ton
on all grades. With an unusually light
demand in prospect and a fair sized crop
averaging up all over the state, indica-
tions are that lower figures will be
reached before warehouse and carrying
charges are made for the season. In-
terior demand is fair and there is more
business going on throughout the state
than in our local market. Export has
been practically confined to a few ship-
ments for government account on exist-
ing contracts.

We quote today wholesale prices in
carload lots as appear from dealers' trans-
fers upon the hay market in San Fran-
cisco (for prices to consumers charges
of cartage, commission and handling
expenses must be added according to condi-
tions):

Per Ton
Wheat Hay, fancy.....27.00@29.00
Wheat Hay (light 5-wire
bales)24.00@26.00
Tame Oat Hay24.00@26.00
Wild Oat Hay18.00@20.00
Barley Hay18.00@21.00
Alfalfa Hay, first cutting.....18.00@23.00
Alfalfa Hay, second cutting..22.00@26.00

Citrus Markets

Los Angeles, August 11, 1920.

Orange market strong without any spe-
cial feature.

Lemons are slightly more attractive to
the market though the foreigners are get-
ting theirs occasionally, one bunch sell-
ing as low as 65 cents. The weather has
warmed up somewhat which is aiding ma-
terially in the lemon situation.

Shipments

Shipments to date from Southern Cali-
fornia since Nov. 1, 1919: Oranges, 26,627
cars; lemons, 6,842; total, 33,469. To same
date last season: Oranges, 29,973; lemons,
8,586; total, 38,559. From Central Cali-
fornia to date this season: Oranges, 5,375;
lemons, 258; total, 5,633. To same date
last season: Oranges, 3,714; lemons, 251;
total, 3,965. Northern California this
season: Oranges, 261; lemons, 23; total,
284. To same date last season: Oranges,
244; lemons, 2; total, 246.

AT THE AUCTIONS

August 9

New York: 13 or., 1 grapefruit, 5 mixed,
1 lem. Val. 1.50-7.90, lem. 4.50-4.85, grape-
fruit 70-2.90, halves 65-1.75.

Boston: 11 or., 3 lem. Val. 3.80-7.80,
lem. 80-4.10, grapefruit 2.05-3.45, halves
50-1.75.

August 10

New York: 16 cars mixed. Val. 4.05-
7.75, grapefruit 1.50-4.45.

Boston: 6 or., 1 lem. Val. 4.10-7.45,
grapefruit 2.85, lem. 3.00-3.25.

St. Louis: 1 or., 1 lem. Val. 3.80-5.00,
lem. 1.95-2.20.

BETTER STATE FAIR

(Continued from Page 203.)

Patterson will come forward with a
high class lot of Percherons and Bel-
gians. Easton and Ward of Diablo
will dominate the Shire classes with
their usual high class showing. M.
Bassett of Hanford will exhibit Per-
cherons, as will Palo Alto Percheron
Farm, Palo Alto; L. A. Hall, Moun-
tain View; Romie C. Jacks, Monterey;
James Marwick, Santa Barbara; Thos.
Harrison, Santa Rosa, and others.
Merritt-Bowers Company, Tulare, will
show Belgians and the estate of Thos.
B. Dibblee will show Clydesdales.

**RHUBARB---Wagner's Giant
Plant Now**
August is a Good
Month to Plant

Growers who planted last July and August have
already harvested over 15 tons per acre netting
\$1000 eleven months from planting. For further
information, write J. B. Wagner, Rhubarb Specialist,
1550 East Villa St., Pasadena, Cal.

Secretary Paine expects the night
horse show program will hold greater
interest this year owing to the fact
that many new horses will come in
competition.

The sheep division continues light.
No satisfactory explanation has ever
been advanced as to why stronger
sheep classes are not presented in
this state with our many nationally
known flocks. C. Harold Hopkins,
Woodland, and Calla Grove Farm,
Manteca, will show Hampshires. Butte
City Ranch, Butte City; Thos. Bishop
Estate, San Ramon; G. K. Swingle,
Davis, show Shropshires. Bullard
Bros., Woodland and G. N. Merritt,
Woodland, show Rambouillets. Ital-
ian Vineyard Company, Guasti, has en-
tered Cotswolds.

There are many other features of
the fair that might be mentioned.
However, Cultivator readers should
make their plans to attend the forth-
coming fair. Old timers will find many
new features and the first time vis-
itor will find enough to keep him busy
the week through. The fair is a great
educational institution and if made full
use of one can learn an astonishing
number of things in a very short time.
The directors and the commercial and
civic organizations of Sacramento,
have completed many plans that will
add to the comfort of the expected
thousands. For a good time and a
profitable week attend the fair.

Sonoma County Fair

Santa Rosa

August 23rd to 29th

Many Big Track Events

Complete Live Stock Show, \$10,000 in premiums.
Two Days' Rodeo Carnival.
Four Days' Running and Harness Races.
50 Mile A. A. A. Auto Race for \$2500.00 purse.
High Class Dog Show, \$1000.00 in cash and trophies.
Night Horse Show, unrivaled by any in the State.
Show opens Monday, August 23rd, with the million dollar
parade, the greatest Stock parade ever attempted in California.
Come, bring your friends.

H. J. WALKER, Secy **Santa Rosa, Cal.**

Dog Show entries close August 19th. Send entries
to John Bradshaw, 528 Market St., San Francisco.

The Oliver No. 7 Plow

An Oliver Orchard Plow also is made especially
to work with the Fordson.

Roderick Lean Automa-
tic Disc Harrow

Built in seven foot size. Other
sizes are also made for spe-
cial conditions. Complete line
of specialized tractor spike
tooth, springtooth and orchard
harrows.

Amasco
Tractor Drill

Accurately sows wheat, oats,
rye, barley, rice, peas, beans,
etc. Furnished in plain grain
or combined grain and ferti-
lizer styles, and with wood
or steel wheels.

How 100,000 Farmers Plow

The Fordson Tractor - The Oliver Plow

A well plowed field is the first require-
ment for a perfect seedbed. It is abso-
lutely essential for a maximum harvest.

Throughout the world progressive
farmers are doing their plowing in the
newer, better way. With reliable
Fordson power they are using specially
built Oliver Plows to turn a uniformly
good furrow.

Special Oliver Plows, in types to meet
any soil conditions, are designed and
built to work with the Fordson. That
is why the work measures up so fully
to what a good plowing job should be.
Oliver Plows will do for you what
they have done for 100,000 Fordson

farmers in America—make your plow-
ing easier and better.

To fully prepare your seedbed you
also will want to use the Roderick
Lean Automatic Disc Harrow which
was designed especially for the Ford-
son. With the ground prepared, the
Amasco Drill and the Fordson Trac-
tor make certain proper seeding. All
of these implements are automatic in
action, being controlled by the operator
from the tractor seat.

Farming the Fordson way with special
Fordson tools is the sure road to com-
plete satisfaction. See the Fordson
Dealer in your town.

Willard STORAGE BATTERY

This trade-mark is branded in red on one side of the Still Better Willard—the only storage battery with Threaded Rubber Insulation.

Remember!

That in the ordinary storage battery the insulation is the weakest link.

That in the ordinary battery both plates and insulation wear out.

That with the ordinary battery the big expense and risk come when you have to tear down the battery and put in new insulation—perhaps with the result that you ruin the plates.

That in the ordinary battery, the insulation between plates carbonizes, causing leakage of current; and perforates, causing short circuits and permitting "treeing."

That the ordinary battery has to be shipped and stored wet or partly wet—aging and deterioration are almost sure to take place.

1 That in the *Still Better Willard* the Threaded Rubber Insulation is the *longest lived* part of the battery.

2 That in the Still Better Willard the wear is *cut in halves*—for Threaded Rubber Insulation does not wear out; it is not affected by the solution.

3 That with the Still Better Willard the Threaded Rubber Insulation prevents this expense and risk.

4 That with Threaded Rubber Insulation these faults, which greatly reduce the efficiency of the battery, *cannot occur*.

5 That the Still Better Willard with Threaded Rubber Insulation is shipped "*bone-dry*," not a drop of moisture in it. It begins service in your car as fresh as when built.

Willard Service.

Of the 191 passenger cars and trucks using Willard Batteries as standard equipment, 138 have adopted the Still Better Willard with Threaded Rubber Insulation.

One Dollar Yearly

Lack of Uniformity in Fumigation Results

By H. J. Quayle Before Pomona Fumigation School

THE keynote of successful fumigation is attention to details. In firing a charge of hydrocyanic acid it is just as important that everything first be set right as it is that everything be set right before firing an artillery piece. There must be the right sort of ammunition and in the proper amount. It is almost as useless to direct a gun with two mile range against a three mile object as it is to direct a dose of cyanide that is insufficient to reach and kill the insects in all parts of the tree. As to the sort of material, that is attended to by the manufacturers, and we can trust them to supply us with uniform material. Like carrying on a military campaign, fumigation must be carried on at the proper time, the condition of the enemy and the weather considered.

Dosage

The question of dosage has received a great deal of attention by Woglum and other workers and it is still an important question. Lack of uniformity in results in some cases is due to too little gas liberated under the tent. This is particularly true in the case of certain of the scales like the Citricola or gray scale. A 75 per cent schedule may give satisfactory results with this scale in some cases, more especially early in the season, but a 100 or 110 per cent schedule is certainly to be recommended for the best results. The same scale may require more gas in certain districts than in other districts. This is strikingly illustrated in the case of the red scale at Corona. The schedules in general use have not been satisfactory for the red scale in that district, and what seems to be the same situation is appearing in certain parts of Orange County. That red scale at Corona is actually more difficult to kill than the same scale in other sections I think we have abundantly proven after five years of investigation. A special schedule for the red scale under Corona conditions has been worked out and this schedule was used throughout last year in practically all of the work against the red scale in that district. The schedule amounts on the smaller trees to 120 per cent and on the largest trees to 160 per cent. We have found it necessary to increase in greater proportion the dosage of the larger trees, since it has been on the larger trees with heavy foliage that poorest results occurred.

Incidentally, we have been experimenting with an absolutely gas proof tent and find that with such a tent the dosage with the smaller trees may be reduced $66\frac{2}{3}$ per cent, while to effect the same results with the larger trees the dosage can be reduced only 50 per cent, which bears out the same point with large and small trees. We have also determined by comparative tests that the greater amount of foliage there is on the tree the greater amount of gas is required, other things being equal.

Season for Citricola or Gray Scale

It is not sufficient to use a high

dosage merely for the best results on the gray scale. It is necessary to do the fumigation work early in the season, preferably before the first or middle of October. Just as soon as the hatch is completed and the fruit is sized sufficiently, fumigation may start for this scale. This will be about the middle of July. The earliest work should be done on Navels and later on Valencias. Fumigation against the gray scale may continue later than October 15 with good results, but good results are less certain after that date.

Season for Black Scale

The fumigation season for the black scale depends upon the hatch of the scale. Where the hatch is uniform the results should be satisfactory.

The hatch of this scale varies greatly in different groves in the same district and it is not always possible to select a proper time. I know of no way of overcoming this difficulty excepting two fumigations in a season. Another point in connection with the black scale is that scales in the proper stage to be fumigated are not killed satisfactorily in certain districts. I have had some experience with this in the Charter Oak district and am not prescribing, at least just now, the solution of that difficulty.

Season for Red Scale

In most sections I believe there is no special difficulty in killing the red scale if a high enough schedule is used, but in the Corona district the

best results can be secured at a certain season. Our work there has shown that there are two stages when the red scale is most resistant to gas. These are the mature, young producing stage and the period of the second molt, and of those two periods they are most resistant during the second molt. The season of greatest activity of this scale is from June 1 to January 1 and at this time more or less are in various stages, including the second molting stage. The scale is most dormant from January 1 to June 1 or 15, and it is during this period that best results have been secured in the Corona district. It is not possible to do all of the work against this scale at the period mentioned, but only where previous work has shown great difficulty in securing

(Continued on Page 219.)

A Stock Resistant to Blight

By A. L. Wisker

EVER since Dr. F. C. Reimer pronounced the Chinese pear seedling, *Pyrus usuriensis*, the "most blight resistant species known," after years of patient testing under scientific conditions at the Southern Oregon experiment station of the Oregon agricultural college, practical orchardists have asked the question, "Will it make a good union with Bartlett?"

It is now safe to say that the cultivated type of this species makes as good a union with Bartlett and other of our commercial varieties as does the Jap seedling, or the old practically discarded French seedling. On Loma Rica Ranch we have several thousand Bartletts on *usuriensis* roots, both buds and grafts, which are as perfect

in appearance, as uniform in diameter above and below the union, and as strong at the union when effort is made to break them, as any other pear stock that I have ever seen. The greater part of this stock will be planted in Loma Rica orchard next spring, but it will only be a part of the acreage allotted to pears on this root. (Some graft unions are shown in the accompanying picture.)

We shall plant 10,000 husky, vigorous *usuriensis* seedlings in the orchard and in the fall will bud the branches to Bartlett and other desirable varieties, thus securing trees proof against blight in roots, trunk and main limb crotches—the greatest measure of blight protection possible to obtain. A few seedlings planted in orchard rows have already been budded in this fashion during the past week, and our one regret is that we cannot put *usuriensis* roots under all our old trees.

The Nevada County mountain districts have been so nearly blight free for so many years that orchardists felt the danger from this disease was practically negligible, but the expense and loss of the past few years has convinced many that our scientific authorities are right in their belief that blight hits every pear district sooner or later and that the safety of pear growing depends on making pear trees as nearly blight proof as possible.

By budding or grafting in the branches the most vital parts of the tree remain of the blight proof seedling. Should blight attack the Bartlett top it will be much more readily detected and much cheaper to eradicate it than under the old conditions where blight frequently had to be fought underground. If one of the Bartlett limbs is killed down to the point of union with the seedling grafting will soon restore it. All in all, the fact that *usuriensis* is now shown to be an acceptable stock for our commercial pears will lead to some important changes in the propagation of pear trees and will result in marked decrease in the injury heretofore done by one of the worst tree diseases known to horticulture.

Bartlett Scions on the Wild Stock

Showing the graft union of the Bartlett on the root stock of *usuriensis*, or wild pear of China.

Agricultural News Notes of the Pacific Coast

Northern California

Draymen of Colusa County have formed an association.

Sonoma County holds its fair at Santa Rosa, August 23-29.

The farm school at Davis opened its fall session Monday of this week.

The new fruit dryer at Placerville, Eldorado County, is ready for business.

The floor space of the Glenn County fair at Orland has been doubled this year.

Lassen County reports the housing situation acute, especially in Susanville.

Surprise Valley, Modoc County, reports excellent crops of grain, alfalfa and potatoes.

The state land colony at Durham plans to hold another fat hog auction September 9.

The almond crop of Northern California is expected to be only about half of last year's.

Hop pickers on the Horst Ranch near Wheatland are being paid \$1.25 a hundred pounds.

Glenn County expects to have a good rice crop. Harvest will begin about September 10.

Orland, Glenn County, shipped out its first carload of watermelons August 3. The car was sent to Portland.

Resolutions adopted by the California state board of health recommend sterilization of canned ripe olives at 240 degrees Fahrenheit for 40 minutes.

The farm bureau of Eldorado County announces that it is not in politics and that office seekers are not warranted in claiming to be farm bureau candidates.

A representative of the California Cattlemen's Association is securing new members in Lake County. A membership campaign has just been completed in Napa County.

Agreement has been reached to furnish water to the Fernley and Hazen reclamation districts of Nevada, not by taking water direct from Lake Tahoe, but by cleaning out debris and vegetable growth in the outlet.

A complete survey has been made of the Lookout-Bieder irrigation project near Alturas, Modoc County, and of the storage possibilities of the Pit River canyon. The findings have been favorable and it is hoped soon to form an irrigation district.

A meeting of representatives of more than 25 irrigation and development organizations of the Sacramento Valley was held in Sacramento last week to attempt coordination of effort of all water users in one program of development and conservation.

State olive growers and health officials of San Francisco recently held conference to consider best action to take in canning practices and equipment to give assurance to the trade as to the perfect safety and healthfulness of the California ripe olive.

No decision has been rendered in the Lake Tahoe-Nevada contest. The Nevada growers have shown that their crops are in a serious situation and that water from the lake is necessary to save them. Californians have maintained their willingness to permit the water to go providing there is no injury to nearby property in California.

Central California

Turlock is shipping sweet potatoes as far east as Iowa.

Lodi, San Joaquin County, will ship 10,000 cars of fresh grapes.

Visalia cannery is running on Elbertas with about 300 employees.

Japanese gardener at Denair was fined \$25 for selling green cantaloupes.

Alfalfa growers of San Joaquin Valley are planting extensively to hairy Peruvian alfalfa.

Figs this year will open around six and seven cents, practically half last year's price.

Cotton growers recently met at Lindsay and discussed the matter of shortage of gins to handle the coming crop.

Santa Cruz County apple growers find that it is costing 7½ cents per box for putting iron straps on all export boxes.

Bee Inspector Burdick of Inyo County is making a campaign on foul brood and has served notice for a thorough cleaning up.

Alfalfa growers of Tulare County have been selling baled alfalfa at \$28.50 f. o. b. This is the record for high price for midsummer.

Monterey County Livestock Association recently held a meeting at Salinas. There was a large attendance of members of the state association.

The last Tulare fat hog sale under direction of the California Farm Bureau Marketing Association resulted in the toppers going at \$16.80, 30 cents lower than the preceding sale.

The San Joaquin Valley planted about 27,000 acres of cotton, but it is feared not much more than half of the planting will be harvested owing to water shortage and inexperience.

Turlock farmers report Japanese making farm leases months earlier than usual. The inference is that they wish to forestall any restrictive measures which may result from the fall election.

Fresno prices for picking raisin grapes, per 22 pound tray: Muscats, 2½ cents; Thompsons, 4 cents. The price for picking, curing and putting in sweat boxes is \$27 for Muscats and \$22.50 for Thompsons.

The Turlock irrigation district has closed its season, which was 18 days longer than last year. The geological survey reports that 313,125 acre feet of waters of the Tuolumne River were wasted in run-off when ditches could carry no more.

Central California papers are calling attention to the fact that because of bad advice by men with academic minds rather than minds stored with practical knowledge there are some serious failures in cotton growing in the San Joaquin Valley this year that could have been avoided if the growers had followed the advice of experienced cotton men.

Advisory basic prices for grape picking have been named by the directors of the Valley Fruit Growers Association. Prices for picking grapes, based on a 22 pound tray, are 4½ cents for Muscats and 4 cents for Thompsons. The ton rate for Muscats is \$27 and for Thompsons \$22.50. This represents an increase of about one-half cent per tray over last year's prices.

Southern California

San Dimas reports largest crop of Navels since 1916-17.

Escondido is planning for Grape Day celebration, September 9.

Talbert, Orange County, now has four dumps in operation.

Cotton growers of Palo Verde Valley are appealing for warehousing of cotton.

Lankershim cannery is running full handed on peaches. Prices for fruit around \$90.

Elsinore apricot growers are receiving returns from early shipments of dried apricots.

Oxnard sugar factory is in full swing day and night. Seven hundred men are employed.

The second annual fair of San Diego County will be held at Balboa Park, September 22-25.

Hemet will ship about 800 tons of dried apricots. The output is much smaller than last year.

Calexico, Imperial County, shows an increase of 680 per cent in its population during the past ten years.

Blythe cotton growers are organizing and planning an advertising campaign to secure pickers and other help.

Articles of incorporation have been filed by the Perris Valley Cotton Growers Association of Riverside County.

Los Angeles County supervisors are advertising for bids for construction of flood control dam in San Dimas Canyon.

Anaheim sugar factory is running with 300 hands. The output of the factory will be 50 per cent greater than last year.

The Alamitos Beet Growers Association met in annual meeting and elected board of directors. The president is W. A. Draper.

A light rain visited the Palo Verde Valley and wiped out the greater number of the aphids which have been infesting the cotton fields.

Santa Ana Walnut Growers Association, the largest local association of walnut growers in the state, has just completed new packing house costing \$200,000.

Corona citric acid factory will increase its capacity so it will be able to handle 1,000,000 pounds of acid yearly and 12,000 to 15,000 pounds of lemon oil.

The livestock entries at the coming Riverside fair have been so liberal that the management is now asking how they can be supplied with sufficient accommodation.

The recent Colorado River Conservation Conference held in San Diego brought together representatives from Imperial and other California sections, also from Yuma, Phoenix, Colorado, Utah and Wyoming.

Sugar factories announce that they will use as a basis for initial payment 12 cent price of sugar. This is 50 per cent higher than last year's payment but rather shocking to the grower who is now paying 25 cents.

San Dimas, Los Angeles County, has a local cooperative ranchers' organization for handling ranch work. By this means small ranches have the advantage of tractors and up to date farm implements at the minimum of investment.

The Coast and General

Polk County fair, Dallas, Oregon, October 7-11.

Oregon state fair, Salem, September 27 to October 2.

Tillamook County fair at Tillamook, Oregon, September 14-17.

Grays Harbor, Washington, farmers recently held all day picnic.

The state of New York is investigating an alleged poultry trust.

Marshfield, Oregon, recently held livestock show which has stimulated interest in pure breeds.

The annual snake dance of the Hopi Indians in the northern part of Arizona was pulled off August 15 and 25.

The weather bureau reports: "Weather ideal in Arizona for cotton. Warm nights and moderately warm days with high humidity."

The first bale of cotton of the season of 1920 for the Salt River Valley of Arizona was brought in by S. S. Bradshaw of Phoenix, July 29.

Jackson County, Oregon, farm bureau has purchased immense warehouse for general farm storage purposes and for the benefit of its members.

California planted this year nearly 300,000 acres to all kinds of beans, nearly half the planting of last year. Colorado has planted 74,000 acres to Pintos.

Dairymen in the Globe district of Arizona raised the price of milk August 1 five cents a pint. The new price is 15 cents a pint and 25 cents a quart.

Carleton, Oregon, Grange has saved money for its members by buying binder twine and by establishing two gasoline stations for the use of its members.

The division of forestry of the Hawaiian Islands is planting large numbers of red mahogany, red cedar and other trees on the reserves on the island of Oahu.

Rains during the latter part of July helped out range conditions to some extent in the higher ranges of Arizona. Rains, however, throughout the state have been somewhat spotted and not as abundant as common.

A committee from Frank Luke Post, American Legion, of Phoenix, has requested that 80,000 acres of the Parker Indian reservation be thrown open for filing to ex-service men. The Parker reservation is on the Arizona side of the Colorado, and there is a considerable area of irrigable land.

Stanley P. Clark, extension agronomist of the Arizona university, has been assisting Dr. Kearney of the U. S. bureau of plant industry in rogueing the fields which have been selected for the seed crop next year. This plan of rogueing was begun in the early days of cotton growing under the direction of E. W. Hudson.

Engineers have made tentative plans for the building of two dams in the Colorado River canyon for the development of electric power. This power, it is estimated, would enable the railroads throughout northern Arizona to use electric power instead of steam. It would furnish cheaper power for the mines and permit the development of several million acres of land by making available cheap power for pumping.

It is well that there are some folks in the world with a taste for statistics. Without them, between the poultrymen who never keep accounts and the consumers who are certain all poultrymen are profiteers, and the pessimists who wail that the poultry game is a losing game at the best, we should have no solid ground on which to set our feet.

One statistician who is helping to bring order out of the chaos of conflicting guesses is F. D. Cornell, who has for several years worked out the statistical tables for the Poultry Producers of Southern California. Mr. Cornell's latest charts are interesting reading and make quite clear the status of the poultry industry in Southern California in this year of grace 1920.

Mr. Cornell assumes for purposes of calculation that the average California hen lays 120 eggs a year. This seems a low estimate, but is based on a large number of reports and agrees exactly with the figures given by the University of California. Since we know from the records of the four U. C. demonstration farms in Los Angeles County that three of these farms averaged over 170 eggs per hen and that all four averaged over 160 eggs, and since we also know that many other producers are averaging over 140 eggs per hen, we are forced to conclude that these must be balanced by a considerable number whose average is less than ten dozen eggs a year. It is these low producing hens that are keeping the average production down and lowering the standing of the whole industry, and it is the owners of these low producers whose buildings are plastered with "For Sale" signs and who are declaring there is "nothing in it."

The hen distributes her production over the year as follows: January, 8.25 eggs; February, 12; March, 15.75; April, 16.75; May, 15.75; June, 12; July, 11.25; August, 9; September, 6.25;

The Poultryman's Profit

By Jean A. Koethen

October, 4; November, 3.25; December, 5.75. In October, November and December as a rule eggs are produced at a loss, for hens must be fed, no matter how few eggs they lay. In September, 1919, eggs were produced at a loss of .0159 per hen, but in September, 1918, there was a gain of 0.91 per hen.

By the terms "loss" or "gain" per hen per month is meant the difference between the cost of keeping the hen for the month and the amount received for her eggs. It cost in 1917 21.74 cents to feed a hen a month, and the overhead was ten cents, making a total cost of 31.74 cents per hen per month. The average of the Los Angeles market per dozen eggs for 1918 was 51.16 cents, but there were three months in which the market value of the very small number of eggs produced was below the cost of keeping the hen and three others in which the average income was but slightly in excess of her keep. These are matters which must be kept in mind by boycotting consumers who insist that because they pay as high as 75 or 80 cents at certain seasons the poultryman must be rolling in wealth.

The average of the Los Angeles market for 1919 was a shade higher, since it reached 54.64, while the cost of keeping a hen a month was only 32.79 cents, but let us remember that 1919 was the one "big year" for the poultryman in at least ten years and will be possibly a bigger year than any for ten years to come. It came at the climax of a series of had years during which producers had dropped off one by one till only the fittest were left. In 1920 the industry finds 25 per cent more producers in the busi-

ness and a demand no greater than before.

Cost of Feed

The average cost of feeding a hen for a month in 1919 was 22.79 cents, about a cent more than in 1918. It cost 21 cents in January, 25 cents in August, and 23 cents in April and December. This fluctuation in cost of feeding from month to month is due partly to the fact that a hen eats more when she is laying heavily, but more probably to fluctuations in the price of feed. It cost \$2.73 to feed the average hen the whole year. This is a lower figure than many had supposed and was probably realized only when feed was bought under the most favorable conditions. Another set of figures before me in the report of ten commercial poultry farms which were operated as demonstration farms by the University of California last year gives the average cost of feeding a hen as \$2.83, which is probably nearer what it cost the average producer.

For the first four months of 1920 the average food cost of a hen per month was 30 cents, being 35.99 in January, 28.45 in February, 28 in March and 27.56 in April. At least progress was downhill for those months. Let us hope that these figures mean the peak of high feed prices has been reached. A further examination of the feed figures for the four months reveals the fact that wheat, barley and milo all dropped more or less in price, the drop being most noticeable in barley, which dropped from \$4.08 to \$3.59, while "egg food," which I suppose means ground grain, held its own, and meat went steadily up from \$6.13 to \$6.75. In April it cost 37.56 cents, including overhead, to

maintain a hen, while the income she brought in was 55.81 cents. This is ten cents less than the income per hen in April, 1919, but nearly three cents more than that in April, 1918.

Count Your "Overhead"

What do we mean by "overhead" in the poultry business? Just what is meant in any other business—the various expenses outside of the actual cost of the article produced. Mr. Cornell classifies the various overhead expenses of the poultry business as interest, taxes and insurance, death loss, replacement cost, repairs, labor, and incidentals, which include hauling, freight, stationery, etc., and finds that in a year they total \$1.20 per hen, or ten cents per month. Obviously no poultryman can look his business squarely in the eye without counting these necessary expenses. If he figures that because he paid out \$1,000 for feed and received \$2,000 for eggs he has made \$1,000, he is going to find himself sooner or later in a deep hole. Possibly it is because producers have been a little careless about keeping account of these insignificant trifles that they have sometimes been betrayed into boasting of their profits. This little item of \$1.20 per hen, which Mr. Cornell says is "probably too low in most cases," means \$1,200 a year in a flock of 1,000 hens and is nearly half the cost of feed. The biggest item of overhead is the labor cost, which is defined as "value of labor used in excess of proprietor's fair time, to include excess labor by proprietor and his family." This, if I understand it, means that the proprietor counts in his hours or days at a fair remuneration, as any other workman would, and considers his profit for the year as his labor income, but that his extra time nights and Sundays and the additional labor of his family are counted under overhead. If we are to arrive at any fair conception of the poultryman's profit it must be by counting in everything that other bus-

(Continued on Page 232.)

Among the Washington Navels

By Ernest Branton

THE Redlands citrus section of San Bernardino County never looked better than it does today. The writer recently traveled miles and miles of that territory by automobile and walked through miles of bearing orchards as well. Except for an occasional gophered tree well up in the foothills, the whole orchard section appears like a vast sea of emerald green. The trees are of very deep color at present and not one orchard was visited but was carrying a sufficient crop of young oranges, well distributed. The "drop" this year was very light; the outlook is full of promise.

Upon asking H. H. Ford, a prominent banker of Redlands and himself an owner of fine Navel groves, where were the more typical and interesting orchards that should be visited, he replied: "I see a man now in the bank on business that owns one of the most profitable orchards of its size and a ranch of such unusual interest that you should visit it." So we were made acquainted with W. H. Featherston, bundled into his automobile and driven through Redlands' famous groves of Washington Navel oranges. Nearly all these were on comparatively level ground and orchards, trees and size and set of fruit so uniform that except for their extreme beauty they would prove monotonous.

On Sunshine Heights

After a time we turned northward and began to climb until we were 800 feet above the city of Redlands and six miles to the northeast, on what is known as Sunshine Heights or "the green spot." Here we first visited the orchard of E. J. Post, the oldest one in that section, planted some 25 to 30 years ago. Then on to the Featherston ranch of 290 acres and complex character. Of this about 200 acres is tillable and 100 acres in citrus trees in variety, though but one lemon tree remains of many acres. All have been topworked to Navels of which there are 20 acres 25 years old down to 15 acres of eight year olds and a few younger trees. There are also 15 acres of full bearing Valencias and a three year old orchard of the same in a black peat soil, the older being on that heavier, redder soil that gave "Redlands" its name. In 20 year old trees there are two acres of St. Michael, six of Mediterranean Sweet, many scattered trees of Marsh Pomelo and six acres of fine "Crafton Late," a budded seedling. From the latter trees Mr. Featherston has received as good returns as from any he has, yet still favors the Washington Navel for future planting.

So much for varieties; now for orchard practices. Soil washed to the

lower ends of orchards is being hauled back to original place. Four men with two teams haul 50 full loads a day. Four years of this work has proven its value by improved condition of trees and increased yield of fruit. Mr. Featherston said: "It has paid me in crop production more than two dollars for every one expended and I believe all can afford to do it, even when oranges are lowest in price. It places a fine mulch on top of roots near the surface and reduces soil depth where trees are becoming too deep set." On other plats there is a crop of Whip-poor-will peas, which has been found the best summer cover crop of several given trial. However, sweet clover in the adjoining Post orchard promises well.

Odd Natural Deposits

During the past four years Mr. Featherston has hauled 3,000 loads of the blackest peat into his orchards, with splendid results. Trees of bad color, general condition and light yield have been made to equal the best. On the tops of two benches these peat deposits cover about three acres each, one with peat four to five feet deep and the other more than ten feet. Though on hilltops the peat marshes have a "lip" of hard soil and over this lip the water trickles and in winter

the decomposed peat washes to the lower lands, covering the hard reddish brown soil with a layer of soft mealy black. These upland marshes, close together, are the "green spot" seen from Redlands and so often asked about by first time visitors. On one side and merging into the peat beds is an inexhaustible supply of light gray soil running more than 50 per cent in sulphate of lime. Of this Mr. Featherston says his neighbors may take freely, without price. In some sections similar deposits are being taken out and shipped to orchards throughout the southern end of the state. Aside from water stock in a neighborhood system this ranch has two tunnels of fine water running 16 and 30 inches respectively and more is being developed. Though Valencias are bearing well in these orchards, they grow too large, return to original green color for June and July and are not so satisfactory as the peerless Navel. Though Mr. Featherston planted Valencias again three years ago, he thinks he made a mistake, excusable because of inexperience. He will probably topwork them to Navels. With Californians at present running heavily to planting of Valencias, with a restricted area where the best Navels may be grown, he thinks the latter should be planted wherever known to do well, for, as Dr. Webber said, "With a greater per cent of both acid and sugar than is possessed by the Valencia, the Washington Navel is the world's best orange."

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertisers in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

MUTUALLY PROFITABLE

California mutual fire insurance companies have been in existence for a score or more of years. It's the regular California habit of cooperation. One or two of these companies have suffered under immense losses and still live, and in the matter of averages the mutual insurers are getting off with little more than half the expense paid by those who prefer profit making institutions.

MOUNTAINS BURNING

Coincident with the deer season is the mountain fire season. The number of hunters and smokers drawn to the mountain districts seems to be responsible for many a column of smoke. The heat in many sections of California during the past three weeks has been intense, and dry tinder of the watersheds, especially in the timber lands, once lighted, makes a fire almost impossible of control. Literally hundreds of fires have been started in three or four of the northeastern counties of the state. Volunteer fighters have been plentiful and most of these fires have been stopped before great damage has been done, but a few of them have raged for days and have added to the insufferable heat and to the awful loss.

BEAN MEN ORGANIZING

Eastern growers of beans are meeting this week in Chicago, "called for the purpose of forming a National Bean Association." The state which produces nearly half the beans of the country, California, seems to have no representative on the program. Therefore, we are guessing that the organization of California's two associations has inspired Eastern bean growers to form their national in order to secure the benefits which California has had in a small measure and now hopes by a more perfect organization to have in fuller measure.

FARM LABOR ORGANIZING

It is rumored that there is to be a convention of fruit workers of the Pacific Coast held some time this fall. The hint is given that if such convention is held it will be under the direction of representatives of the American Federation of Labor. If the American Federation of Labor proposes to introduce its methods of controlling the employer into fruit growing sections, the fruit grower should rouse himself to a full consideration of what this will mean to him. The manufacturer who can bank his fires and wait until a labor supply can be secured is comparatively independent; the farmer whose year's profits, in fact, very existence, depend upon harvest operations which shall be completed almost on the minute, will be absolutely helpless if his labor supply is to be under the control of an outside party who knows nothing and perhaps cares less as to the steps necessary to the farmer's welfare.

KNOCKING BONDS

It seems that the treasury needed more funds to pay some of the bills which were pressing as the result of the enormous horde of employees in Washington and elsewhere. The bond issue habit offered the suggestion, and bonds, or rather "treasury certificates," were offered. The need was great, so the highest interest paid by our government in several scores of years—six per cent—was named. The 150 millions wished was oversubscribed by more than 50 millions. Naturally Liberty Bonds feel the impact of such financing, and people who stood by the government, but forced at this time to dispose of their bonds, will see with dismay present quotations on the government's paper bearing 4 1/4 per cent.

We are not in favor of any effort by legislation to force back par values on our depreciated bonds, but we are most decidedly in favor of our own government refraining from pounding the life out of them.

IT PAYS

The quarantine, which is sometimes desperately aggravating and prevents possibly a real advance in horticultural practice, is not entirely without advantage. For instance, reporting as to the chestnut trees of the state of Pennsylvania, Clifford Pinchot, state forester, says:

"Chestnut trees will disappear for the present. . . there may be a time when chestnuts again will grow in Pennsylvania." But this will not occur in your lifetime nor mine. It is stated that "no living chestnut trees now exist east of the Susquehanna River" and that there is no hope of saving the few trees left in the north-east section of the state.

A tragedy in tree life which is du-

plicated, though usually in miniature, in other sections of the country. If the Atlantic Coast had been as carefully policed in horticultural matters as has the Pacific Coast, those New England and other Eastern states would not be deprived of one of their most loved and most valuable trees.

BROKEN RICE

A large proportion of the output of the rice mills has always been what is termed "brewer's rice," a finely broken portion of the grain which is not desired in the market and which seems to be a necessary evil of the rice industry. The breweries offered an outlet. Today they have no use whatever for this product.

While in Sacramento some time ago we witnessed the milling of rice from the raw product as it comes from the field to the finished product ready for the table. We noted the removal of the hulls, the removal of the bran, the rice polish, even treating with glucose of a specially high grade whole seed product. Among these various products was brewer's, or finely broken, rice. In searching for an outlet the millers had made investigation as to breakfast food possibilities. A test, or sample, package gave opportunity to try out this new breakfast food. The broken rice was broken somewhat finer or made into a rather coarse meal. This makes a "mush" or breakfast dish similar in consistency or appearance to Germea.

It's good. (Smothered in raspberries, sugar and cream, it's perfect.) We could make several breakfasts a week from this product, and if all the rest of America would do likewise, we could settle the brewer's rice question. But a requisite to its universal use is the spending of some two dollars worth of advertising for each one dollar's worth of product. If the rice growers have the two dollars their fortunes may be made.

COSTING MILLIONS

President Howard of the American Farm Bureau Federation says: "The railroad tangle, with its resulting tie-up in grain movement, is costing the farmers of this country hundreds of thousands of dollars daily."

It sometimes looks as if the railroad management and the administration at Washington were playing horse with the farmer. Only a few days ago it was stated that as high as 25 per cent of last year's crop of grain still remains in local elevators. This, with the new crop clamoring for transportation, creates a condition which is causing the farmer these millions of loss. Warehousing interests are taking advantage of the situation by making excessive storage charges. The banker is not helping out by lowering interest rates, at least not so that anyone knows of it. It is estimated that this extra cost, in excess of a normal year, amounts to at least ten cents per bushel. Most of this excess cost will be borne by the farmers. Then another loss to be borne by both producer and consumer is the higher freight rate forced by delay in shipment and higher price which must be paid for inefficient labor.

President Howard continues: "One of the most lamentable features of the whole situation is the effect it all may have upon next year's crop. With much of last year's crop still on the farm, with little prospect of moving the present crop within the year, and with the local banks clamoring for liquidation of loans, there is little to encourage heavy seeding for the com-

ing fall. Preparation for the next crop will start within a month, and prediction of heavy cuts in acreage are general."

RECLAIMING PALESTINE

The Zionist organization of America is appealing for American foremen to take charge of various units in Palestine which shall aid in the agricultural reclamation of that land. The situation was most difficult because of the barrenness of the land and the political conditions prior to the war. Soil conditions have not improved, but with English troops there, political conditions will be materially better. The effort now will be to establish poultry and dairy farms and thus reclaim the land from barrenness. It is expected that the colonists will be practically all Jewish.

DAIRY EXPERTS

At the recent meeting of the California Dairy Council held at Hanford the following resolution was adopted:

"Be it resolved, that it is the sense of this meeting that the dairying industry of the state of California is of sufficient importance to entitle it to have the undivided service of one or more specialists in dairying in the agricultural extension service of the University of California college of agriculture, and that we, by this resolution, do respectfully request the dean of the college of agriculture of the University of California and the director of agricultural extension to give this question careful consideration and to detail a definite number of men to this work. It is the sense of this meeting that more constructive work can be done and more rapid improvement accomplished through the development of dairy departments in the county farm bureaus and by the continuous full time work of a few men of the extension service than can be realized from the present unorganized condition of the dairymen and the part time effort now possible to devote to the industry by the overworked farm advisers."

The above resolution points out a real need in the dairy industry in this state and the Cultivator sincerely hopes that the regents and the faculty of the college of agriculture lend their whole hearted support in an effort to correct a situation that has been permitted to exist too long.

The dairy industry of California represents a vital and important branch of agriculture, and because of the basic importance of the industry and because of the present unsatisfactory condition surrounding production in the average herd, great results could be obtained if the industry were accorded the services of a strong corps of dairy experts.

We deem it of high importance that the University of California act on the above resolution and that whatever action is taken be such as to attract men of outstanding accomplishments. Better one such man than several of lesser caliber.

STATE FAIR JUDGING PROGRAM

Secretary Palne has announced the following program as the probable schedule of judging:

Monday—Shorthorn cattle, Holstein cattle, Poland China swine, Berkshire swine, Hampshire sheep.

Tuesday—Hereford cattle, Jersey cattle, Ayrshire cattle, Guernsey cattle, Duroc-Jersey swine, Chester White swine, Tamworth swine. Finish sheep classes not judged on Monday.

Wednesday—Draft horses, miscellaneous livestock classes.

Lost, Starch; Red Spider Responsible

By Fred K. Howard.

SOUNDS queer, doesn't it? Many of us do not think of starch as being connected with the fruit business at all; still, it wasn't so many years ago that it took "starch" to stay in the fruit business. Now, when fruit is selling for good prices we are losing the starch, and the red spider is responsible. The loss of starch in fruit growing means in the long run the loss of fruit. Loss of fruit means loss of money. Poor quality of the fruit is also money lost, and the red spider is responsible for a great deal of the poor quality fruit delivered each year. The cooperative organizations are saying a great deal about quality these days and everyone realizes that good quality fruit is essential to the future success of the industry.

If you should make a survey of the fruit districts of the San Joaquin Valley today you would find ample evidence of the work of this "pesky little brute," as one grower termed the red spider. A serious infestation of the sort commonly observed in all sections of the valley during late July and August, happening with equal seriousness year after year as it often does, makes one wonder how trees can continue to live and bear fruit worth delivering to the packing house under such adverse conditions. True, the crop is usually harvested before the infestation becomes really serious, but while this season's crop may escape injury, we still have next year to reckon with. The error seems to be that too few growers realize the importance of starch and the part played by the leaves in the life of the tree, and how they function to produce fruit. By a very complex and little understood process the green coloring in the leaves has the power of transforming the crude materials taken up by the roots, and the gases from the air into starch.

This starch is the great essential of plant growth. Without it new wood could not be formed. The roots could not push out after more supplies of crude plant food in the soil and new buds for the next season's crop could not be formed. Starch can only be manufactured in the green leaves of the plant; the greener the leaves, the better they function. Is it any wonder that the trees which suffer every year from a combination of spider injury and lack of water fail to produce paying crops of good quality fruit? Many growers spray diligently every spring for they know full well what will happen to the crop should the trees become affected with blight or curl leaf, but they entirely neglect spider control, apparently because they cannot actually see it affect the crop. These same growers will irrigate with care and see to it that the moisture content is always right when the fruit is on the trees, but allow the soil to become bone dry after the harvest. This combination of circumstances is the cause of the leaves turning a sickly yellow and one by one dropping to the ground until here and there we can see leafless limbs. The dropping often continues until the trees become entirely defoliated, and because of a lack of water in the soil the tree cannot recover sufficiently to put out new leaves until late in the season, too late to fully mature new buds or to store sufficient reserve starch to insure a vigorous new growth the following spring. The problem of after harvest care in the San Joaquin Valley is indeed a serious one. Each year sees this pest making a little more headway in all districts and, in spite of repeated warnings of the horticultural officials and farm advisers, little is done in the way of control on a large scale. Almonds, peaches, prunes and even grapes come in for a full share of injury, and the pest is so widespread and general that it is impossible to even estimate the many thousands of dollars lost by growers each year. One good irrigation after the fruit is off is practiced by a great many growers with a great deal of success and will go a long way toward helping the trees to withstand the effects of spider injury. To be entirely effective some other control method is essential. Just what method should be followed will depend

largely on the equipment available, and should be decided by the grower himself. Liquid sulphur sprays have proven very effective provided the application is thoroughly made. Some growers have had good success with a simple cold water spray applied with a power machine during the early evening. The cost of such an application is very low and if repeated applications should prove necessary it would undoubtedly still prove a cheap method of control. Dry sulphur is probably the best and cheapest remedy yet found for this pest. It is not to be expected that one careless application of anything is sufficient, for we have a real pest to fight, a pest which is much more serious than it is usually credited with being. No matter how many applications are necessary, the increase in the fruit crop will take care of all spraying bills.

CALIFORNIA APRICOT AND PRUNE GROWERS

Prices for 1920 crop prunes, named by the board of directors of the California Prune and Apricot Growers, Inc.: Sunsweet quality, 20-30's, 25 cents a pound flat; 30-40's, 17 cents bulk basis; 40-50's, 15½ cents bulk basis; 50-60's, 13 cents bulk basis; 60-70's, 11½ cents bulk basis; 70-80's, 10½ cents bulk basis; 80-90's, 9½ cents bulk basis; 90-100's, 9½ cents bulk basis. Growers' quality was set a half a cent a pound less than Sunsweet.

In giving out the prices, H. G. Cockendall, general manager of the association, said:

"Last year's prices brought the grower members of the association the highest prices and the greatest prosperity they have ever known. Today's prices are indisputable proof that this cooperative marketing association is able to guarantee its grower members prosperity even in the face of very unsatisfactory selling conditions.

"The tendency in all markets is downward, not upward. On top of a financial situation which prohibits any speculation on the part of buyers, millions of pounds of prunes which were exported to Europe last fall are being shipped back to this country and thrown on the domestic market. Yet, in spite of these conditions the association has been able to name prices to the growers higher than last year's record prices.

"Even in the districts where only the lower priced prunes are grown today's prices insure the growers in these sections a return equal to that which will be received by the growers who produce the larger sizes. This is because the growers of the lower priced fruit produce a much larger tonnage per acre than the growers who raise the larger and higher priced sizes.

Several of the large citrus growers of Porterville have tried as an experiment a summer cover crop of cantaloupes, some planting between six and eight rows as a test. They claim they had A-1 results, getting a heavy crop and fewer falls. Claim it cools the ground and gives moisture to the trees. They say they will plant their whole orchards next year to cantaloupes as a summer cover crop, not so much for marketing but as a protection for their trees.

The Consolidated Canneries of California canned in Porterville this season 700 tons of apricots. Will also can 2,000 tons of peaches and 250 acres of tomatoes. This is from the Reedley-Porterville section. They are running to their full capacity, doing all their canning in Porterville. They are not running their cannery at Bakersfield.

A Mr. Myers of Coachella Valley from nine acres of grapes netted \$6,000. This crop brought nine cents per pound f. o. b. cars Coachella. The last car of grapes has left the Coachella Valley, approximately 60 cars having been shipped. It is anticipated that the average price will be five cents per pound.

BEST TRACTOR EARNINGS

During the first six months of this year the C. L. Best Tractor Company's net earnings have been \$404,399.56.

After provision for Federal taxes this is more than five times the dividend requirements on the total new issue of preferred stock before any returns from the doubling of the plant's capacity.

There are no bonds or other mortgage indebtedness.

When Writing Advertisers Mention California Cultivator

Just Like the Old "Teeter"

*Rocking principle that doubles
life of track unit*

Simply a case of track links turning back and forth on an *edge*, like the balance of a scale, instead of on a link pin which rubs its entire surface at every turn.

This "rocker joint" is an exclusive Best feature. It requires no grease or oil—collects no grit to cut the joints. It makes a track that will outwear any other type. You can realize the advantage of this, especially when operating at full capacity during the busy season. Track links are made of manganese steel, the toughest metal known to science.

All the other features of the Best Tracklayer have been worked out with the same care, and are the result of long years of tractor-building experience. Motors are built in our own plant. 36 Timken, Hyatt and roller bearings reduce friction to the minimum and assist lubrication. Three-point suspension relieves mechanism of jolts and twists. Independently controlled tracks enable tractor to turn in its own length. Correct design gets power to drawbar with least waste. Working parts entirely housed and easily accessible. No belts or chains—all gears. Only 7 grease cups—10 minutes to grease-up.

The remarkable success of the Best Tracklayer can be attributed to these superior features of design, material and workmanship. If you are interested in tractors send for our catalog.

The Pioneer Citrus Orchard

By Ernest Brauntón

In 1974 Nathan W. Blanchard of Santa Paula planted 71 acres of seedling oranges. Three years later a part of this was budded to lemons. The remainder continued as seedling oranges until six, seven and eight years ago when they were top worked to Valencias. These gnarly old patriarchs presented quite a problem, for the number of buds to a tree ranged from four to 14. Having such a prodigious root system, the buds grew vigorously. In

tral leaders and some cutting out must be done. Up to the present the need of such work has not been apparent.

But the lemon trees hold the record. Five of the larger trees were recorded at each picking and it was found they had averaged 28 boxes to the tree and the best one bore 33½ boxes of marketable lemons! That was some crop! These trees have been pruned very little, some of them not at all. The so-called "sucker wood," about which we have harped so much, has seldom appeared and has been little noted. After years of examination of citrus orchards throughout the southern end of the state, the writer is almost ready to declare: "There hain't no sich animal." We force the sucker wood into growth by injudicious pruning, as is proven by some of these old orchards that scarcely know the shears and never the saw. The Blanchard orchard is not of the low growing bush type that has been slashed off on top as by a gigantic scythe, nor are the trees lofty enough to present picking problems. They have "jes growed" naturally, like Topsy, and have given the best returns of any lemon trees in the state. Some day, the writer predicts, all pruning will consist of annual thinning, with an occasional cutting out of an abnormal growth. Nature is sufficient, invites aid, but never a combat. The whole Blanchard citrus area is 150 acres, of which 90 acres are in Valencias, and some of it is of very recent planting. A. S. Knick, the superintendent, is in favor of little or no pruning except to shape the young tree. He says that where a branch seriously interferes with proper development he does not hesitate to cut it out, but he does not seek an excuse to make a general pruning each year or even in a series of years, but lets nature take its course, with slight guidance in the right direction.

A Pioneer Tree

N. W. Blanchard ranch at Santa Paula, June 1920. Seedling orange planted, 1874 and topworked, 1912. James D. Culbertson standing by tree.

1919 one of the eight year old tops bore 22 boxes of Valencias and the average for the whole lot was eight and a half boxes to the tree. Some of these trees now have too many cen-

Don't Pick Peaches Green

The recent issue of the "Associated Grower" discusses the unwisdom of sending out green dried chips for dried peaches. It sours the consumer and does not leave a kindly feeling for the producer. The "Grower" says:

Peaches Should Be Fully Matured

Of the many features entering into the successful drying of peaches, so that they can be readily peeled after their delivery to the packing house, the most important is to be found in the method pursued in picking the fruit. Some growers have in the past gathered their fruit by shaking it down from the trees. The result of this has been that a considerable number of immature peaches could invariably be found in lots that were handled in that manner, for even a gentle shaking of the trees will cause a number of green peaches to fall to the ground together with the ripe fruit. This method should absolutely be discontinued and all fruit picked by hand, for we shall never achieve for our product the reputation for high quality we all strive for so long as our fruit contains a large percentage of immature specimens.

A peach that is not fully matured when it was gathered off the tree cannot be peeled successfully after it is dried and the quality of our Blue Ribbon Practically Peeled Peaches now depends very largely upon the care taken by our growers in the harvesting of their fruit.

The picking of the fruit by hand will eliminate most of the immature specimens but it will not eliminate all of them. Windfalls or green fruit gathered through the faulty judgment of a picker will occasionally find their way into the boxes before they are hauled to the cutting shed, and those should be carefully culled out by the cutters and placed upon separate drying trays, and when cured they should be delivered to the packing house in separate boxes.

Fruit Properly Cured

All fruit should be properly cured

when it is delivered to the packing house. While this has always been an important feature in the peach industry, now that nearly all of our peaches are peeled, it is imperative that our growers place their fruit in that condition before they consider it ready for delivery, for our peeling machines can not handle the peaches successfully unless they are perfectly dry when they are placed therein. If it should be found during the drying process that some peaches are not quite dry, while the balance on the tray are ready for the sweatbox, those pieces should be picked out and redried and they should not be mixed with the other fruit under the supposition that the dry fruit absorbs the surplus moisture from the others.

AVOCADOS AT SAN MARINO

On the San Marino ranch of H. E. Huntington there is a total of 1,329 avocado trees, the first lot set out in orchard form in California. This orchard consists of 486 trees planted in 1910, budded in 1911 and all frozen below the buds in 1913. They were rebudded in 1917 to Fuerte, Sharpless, Spinks, Linda, Queen and Knight, and interset with budded trees of promising seedlings which have fruited on the ranch. Some of these may later be named and the budwood distributed.

On this large ranch of 485 acres these are several small orchards and groups containing in all about 25 named varieties and a like number of seedlings that have fruit and are considered sufficiently valuable for crop or experimental purposes to be retained, for the present at least. One small orchard contains 19 varieties sent as pot plants by the United States department of agriculture. These were budded from wood sent from Guatemala by Wilson Popenoe, the government plant explorer who is now in quest of avocado and other fruit trees in Costa Rica. It is expected that in this collection of 19 some will be found of equal or greater value than any we now grow, for they are Guatemala's best.

Have You Seen That New John Deere Plow?

Because it is built of new-process John Deere steel, the No. 40

weighs less than the average horse-drawn sulky plow;

pulls extremely light—a real fuel saver;

stands the strains under all conditions -- its beams are guaranteed not to bend or break.

Due to the self-adjusting hitch—an exclusive John Deere feature—bottoms run true and level at all depths—they neither “nose in” nor “hop out” of the ground.

Its John Deere bottoms insure good work.

YOU have been hearing for some time, no doubt, that John Deere was building a new plow especially for the Fordson tractor.

Perhaps you are one of the many farmers who asked that John Deere build such a plow.

Perhaps you are one of the many who have gone to John Deere dealers with the query: “When can I see that John Deere plow built especially for the Fordson?”

John Deere specialists took their time in building the plow. They had the John Deere reputation to consider, first of all. They knew that farmers expect especially good performance from a John Deere plow. Their task was to give the user the benefit of such performance behind his Fordson tractor—to fit a John Deere-quality plow to the Fordson as carefully as a good tailor fits a suit of clothes to a customer.

The plow is now ready. It has been branded with the famous John Deere trademark of quality. It is called the John Deere No. 40.

Here Are Features That You have been Wanting

Imagine a two-bottom tractor plow that is lighter than the average horse-drawn sulky plow—

It's Built Especially For the Fordson Tractor

—a tractor plow that pulls so light that it soon pays for itself in lower fuel consumption, greater acreage per day, minimum wear on the tractor—in all the factors that mean lower plowing cost per acre—

—a tractor plow that has this desirable light weight and light draft plus tremendous strength—beams that are guaranteed not to bend or break; frame construction that stands all of the strain of utilizing the tractor's power under all conditions.

The No. 40 fits the Fordson. The No. 45 is built for use with ANY “two-plow” tractor.

Those are important features of the No. 40 that you are sure to appreciate.

Beams, braces and axles are made of a new process, John Deere steel that combines the desired lightness with the necessary strength.

It's the Plow with the Self-adjusting Hitch

The No. 40 has a self-adjusting hitch—an important advantage in plowing with the Fordson.

When you adjust the plow for depth with the depth lever, the hitch point auto-

matically regulates itself to the correct line of draft.

That means that the bottoms run true and level at all depths, doing uniformly good work all the time.

It means that there is no undue wear on shares because of bottoms “sledding” or “running on their nose”; no worry or loss of time over hitch adjustments.

The self-adjusting hitch is exclusively a John Deere feature. Any plow for use with the Fordson needs it, but—no other plow has it.

John Deere Bottoms do Good Work; Wear Well

The No. 40 is equipped with genuine John Deere bottoms—the bottoms that scour, wear well and make good seed beds.

These bottoms include both steel and chilled types in a variety of shapes to meet different requirements.

The shares are quick detachable—loosen one nut to remove a share; tighten the same nut and the share is on tight.

The power lift of the No. 40 is simple, strong and positive. It works perfectly. The lifting parts move only when the plow is being raised or lowered—practically no wear.

This is the Plow the Fordson Needs

If you are planning to buy a Fordson tractor, it will

pay you to investigate the No. 40.

The tractor will give you pulling power. It will be up to the plow you buy to apply that power. Remember that, no matter how well a tractor may do its part, the plowing outfit is no better than its plow—just as no knife is better than its blade. You need the best plow you can get.

The No. 40 may be on display in your town now. If it isn't it soon will be. Get acquainted with it thoroughly before you buy your tractor.

The best place to judge the No. 40 is in the field. Watch it at work and see for yourself how wonderfully light it pulls; how simple and strong the hot-riveted frame construction is; how the self-adjusting hitch keeps the bottoms running true and level at all times, and how the bottoms scour, pulverize and turn the soil in that John Deere way—the way the practical farmer wants it done.

Another Plow for ANY “Two-Plow” Tractor

If you are planning to buy a “two plow” tractor other than the Fordson you will be interested in the John Deere No. 45. This plow is exactly like the No. 40, except that it has a flexible hitch and rear furrow wheel. It has the fuel-saving light draft, the strain-resisting strength, and the seed bed-making qualities of the No. 40. It is adaptable for use with any standard two-plow tractor.

Ask us to send you free booklets describing these lighter, stronger plows for “two-plow” tractors. Drop us a postcard or letter today. Ask for booklets F-17.
